# BRIEF SUBJECT INDEX

School Nurses 3465  
 School Organization [See Educational Administration]  
 School Phobia 3697, 3718  
 School Psychologists 4071  
 School Psychology 3835, 3973, 4087  
 School Readiness 4093  
 Schools [See also Colleges, High Schools, Nursery Schools] 3932, 3959  
 Science (Social) [See Social Sciences]  
 Sciences [See Anthropology, Biochemistry, Biology, Child Psychiatry, Community Psychiatry, Community Psychology, Comparative Psychology, Consumer Psychology, Counseling Psychology, Developmental Psychology, Educational Psychology, Epidemiology, Forensic Psychiatry, Geography, Industrial Psychology, Medical Sciences, Neuroanatomy, Neurochemistry, Neurology, Neuropsychology, Neuropsychology, Psychiatry, Psychology, Psychopathology, School Psychology, Social Psychology, Social Sciences, Sociology, Surgery, Transcultural Psychiatry]  
 Scientific Communication [See also Professional Meetings And Symposia, Psychological Terminology] 2107, 3196, 3237  
 Scientific Methods [See Experimental Methods]  
 Scopolamine 2523, 2546, 2681, 2685, 2695  
 Scopolamine Hydrobromide [See Scopolamine]  
 Scores (Test) [See Test Scores]  
 Scoring (Testing) 2136, 2138, 2141, 2143, 2175  
 Scotland 3220  
 Screening Tests [See Selection Tests]  
 Seals (Animal) 2804  
 Seasonal Variations 2713, 4089  
 Secondary Education 3939  
 Secondary Reinforcement 3437, 3776  
 Secretion (Gland) [See Lactation]  
 Sectioning (Lesion) [See Lesions]  
 Security (Emotional) [See Emotional Security]  
 Sedatives [See Amobarbital, Atropine, Chlorpromazine, Haloperidol, Heroin, Hexobarbital, Meperidine, Methaqualone, Pentobarbital, Promethazine, Reserpine, Scopolamine]  
 Segregation (Racial) [See Racial Integration]  
 Seizures [See Convulsions]  
 Selected Readings 2979  
 Selection (Personnel) [See Personnel Selection]  
 Selection Tests [See also Psychological Screening Inventory] 3394  
 Selective Attention 2236, 2401, 2415  
 Selective Breeding 2525, 2789  
 Self Actualization 3144, 3147, 3150  
 Self Assessment [See Self Evaluation]  
 Self Concept [See also Self Esteem] 2358, 2825, 2875, 2880, 2881, 2916, 3414, 3462, 3572, 3586, 3720, 3864, 3991, 3992, 4039  
 Self Confidence [See Self Esteem]  
 Self Control 2424, 3047, 3621  
 Self Disclosure 3287, 3567, 3714, 3758, 3807  
 Self Esteem 3992, 4007, 4101  
 Self Evaluation 2657, 2841, 3139, 3198, 3348, 3349, 3412, 3462, 3610, 3626, 3642, 3675, 3998, 4020

Self Image [See Self Concept]  
 Self Inflicted Wounds 3178  
 Self Mutilation [See also Head Banging] 3256, 3257, 3258, 3351  
 Self Perception 2372, 2841, 2879, 2882, 2889, 2999, 3010, 3013, 3029, 3047, 3119, 3593, 3998, 4104  
 Self Realization [See Self Actualization]  
 Self Reinforcement 3040, 3726  
 Self Respect [See Self Esteem]  
 Self Stimulation 2453, 2514, 2549, 2577, 2621, 2696, 2701, 2736  
 Semantic Differential 2146, 2150, 2181, 3091, 4184, 4228  
 Semantic Generalization 2316, 2332  
 Semantics 2304, 2360, 2383, 2386, 2394, 2400, 3067  
 Senescence [See Aged]  
 Senior Citizens [See Aged]  
 Sensation [See Perception]  
 Sensation Seeking Scale 2479  
 Sense Organ Disorders [See Anosmia, Eye Disorders, Motion Sickness, Nystagmus]  
 Sense Organs [See Cochlea, Cones (Eye), Pupil (Eye), Retina, Vestibular Apparatus]  
 Sensitivity (Personality) 3049, 3119  
 Sensitivity Training 2999, 3004, 4202  
 Sensitization Repression [See Repression Sensitization]  
 Sensory Adaptation [See also Orienting Responses] 2216, 2222, 2263, 2276, 2280  
 Sensory Deprivation 3111  
 Sensory Feedback [See also Auditory Feedback, Delayed Auditory Feedback, Visual Feedback] 2290, 2297, 4052  
 Sensory Motor Processes [See Perceptual Motor Processes]  
 Sensory Neurons [See Auditory Neurons, Cones (Eye)]  
 Sentence Comprehension 2304, 2314, 2351, 2374, 2383, 2411  
 Sentence Structure 2233, 2304, 2314, 2316, 2374, 2411  
 Sentences 2369, 2400, 3083, 3114  
 Separation (Marital) [See Marital Separation]  
 Separation Anxiety 2806  
 Sephardim [See Judaism]  
 Septum (Brain) Lesions [See Brain Lesions]  
 Sequential Learning 2389, 3457, 4044  
 Serial Learning 2377, 2417, 3425, 3428, 3457, 4044  
 Serotonin 2500, 2517, 2594, 2607, 2608, 2635, 2645, 2671, 2688, 2690, 3338, 3689  
 Serotonin Antagonists [See also Lysergic Acid Diethylamide] 2604, 2645, 2700  
 Serpasil [See Reserpine]  
 Serum (Blood) [See Blood Serum]  
 Servicemen [See Military Personnel]  
 Set (Response) [See Response Set]  
 Severely Mentally Retarded 3438, 3727, 3874, 4058  
 Sex Differences (Animal) [See Animal Sex Differences]  
 Sex Differences (Human) [See Human Sex Differences]  
 Sex Education 3959, 4006  
 Sex Hormones [See also Androgens, Estradiol, Estrogens, Progesterone, Testosterone] 2538, 2591  
 Sex Identity [See Sex Roles]  
 Sex Linked Developmental Differences 2828, 2878

Sex Linked Hereditary Disorders [See Testicular Feminization Syndrome]  
 Sex Roles 2859, 2875, 2878, 2926, 2932, 2941, 2962, 2966, 3025, 3080, 3109, 3136, 3376, 3555, 3741, 3870, 4099, 4107, 4127, 4154, 4155, 4236  
 Sexual Attraction [See Psychosexual Behavior]  
 Sexual Attitudes 2941, 2947, 2966, 3211, 3390  
 Sexual Behavior [See Psychosexual Behavior]  
 Sexual Development 2792  
 Sexual Deviations [See also Incest, Transsexualism, Transvestism] 3340, 3410  
 Sexual Function Disturbances [See also Impotence, Premature Ejaculation] 3741, 3746  
 Sexual Intercourse (Human) [See also Incest, Rape] 2949  
 Sexual Receptivity (Animal) [See Animal Sexual Receptivity]  
 Sexuality 3211, 4072  
 Shame [See Guilt]  
 Shape Perception [See Form And Shape Perception]  
 Shock 2535, 2681, 2739, 2741, 2749, 2752  
 Shock Therapy [See also Electroconvulsive Shock Therapy] 3634  
 Shopping [See Consumer Behavior]  
 Short Term Memory 2307, 2310, 2389, 2391, 2402, 2408, 2412  
 Short Term Psychotherapy [See Brief Psychotherapy]  
 Shoshone Indians [See American Indians]  
 Shyness [See Timidity]  
 Sibling Relations 2791, 3296  
 Siblings [See also Heterozygotic Twins, Twins] 3332  
 Sickness (Motion) [See Motion Sickness]  
 Side Effects (Drug) [See also Drug Addiction, Drug Adverse Reactions, Drug Dependency, Heroin Addiction] 3637, 3644, 3665, 3668, 3697, 3698, 3705  
 Sight Vocabulary 3978, 3982  
 Signal Detection (Perception) 2206, 2209, 2230, 2243, 2246, 2248, 2250, 2257, 2260, 2270, 2393, 2415, 2440, 2676, 2741  
 Signal Intensity [See Stimulus Intensity]  
 Significance (Statistical) [See Statistical Significance]  
 Similarity (Stimulus) [See Stimulus Similarity]  
 Simulation [See also Computer Simulation, Flight Simulation, Mathematical Modeling, Simulation Games, Stochastic Modeling] 2813, 2981, 4010  
 Simulation Games 3910  
 Simulators [See Simulation]  
 Sixteen Personality Factors Questionnaire 2157, 3137, 3157, 3232  
 Size 2713, 2798  
 Size (Group) [See Group Size]  
 Size Discrimination 2264, 2849  
 Skeletomuscular Disorders [See Musculoskeletal Disorders]  
 Skilled Industrial Workers 4221  
 Skills [See Ability]  
 Skin Conduction [See Skin Resistance]  
 Skin Disorders [See also Dermatitis] 3486, 3490  
 Skin Electrical Properties [See Skin Resistance]

**Skin Resistance** 2444, 2477, 2484, 2490, 2501, 2508, 2592, 3062  
**Skin Temperature** 2592  
**Sleep** [See also NREM Sleep, REM Sleep] 2449, 2464, 2473, 2483, 2486, 2495, 2500, 2512, 2513, 2521, 2544, 2552, 2571, 2581, 2604, 2666, 3297, 3333, 3505, 3656  
**Sleep Disorders** [See also Insomnia, Narcolepsy, Somnambulism] 3244, 3786  
**Sleep Onset** 2522, 3656, 3701  
**Sleepwalking** [See Somnambulism]  
**Slow Learners** 4051  
**Slow Wave Sleep** [See NREM Sleep]  
**Smell Perception** [See Olfactory Perception]  
**Smoking (Tobacco)** [See Tobacco Smoking]  
**Snake Phobia** [See Ophidiophobia]  
**Social Acceptance** 3029  
**Social Adaptation** [See Social Adjustment]  
**Social Adjustment** 3261, 3387, 3491, 3707, 3887, 3902, 4026, 4057, 4220  
**Social Approval** 2887  
**Social Behavior** [See also Aggressive Behavior, Altruism, Animal Aggressive Behavior, Animal Courtship Behavior, Animal Distress Calls, Animal Dominance, Animal Maternal Behavior, Animal Mating Behavior, Animal Sexual Receptivity, Animal Social Behavior, Assistance (Social Behavior), Attribution, Bargaining, Charitable Behavior, Collective Behavior, Competition, Compliance, Conflict, Conversation, Cooperation, Eye Contact, Gambling, Group Discussion, Group Participation, Group Performance, Interpersonal Attraction, Interpersonal Communication, Interpersonal Influences, Interpersonal Interaction, Interviewing, Involvement, Job Applicant Interviews, Leadership, Leadership Style, Negotiation, Participation, Peer Relations, Praise, Psychodiagnostic Interview, Reciprocity, Responsibility, Risk Taking, Social Acceptance, Social Adjustment, Social Approval, Social Dating, Social Facilitation, Social Interaction, Social Perception, Social Reinforcement, Verbal Reinforcement, Victimization, Violence, War] 2889, 2978, 3039, 3366, 3730, 3751  
**Social Casework** 3224, 3863, 3876, 3877, 4173  
**Social Caseworkers** [See Social Workers]  
**Social Change** 2118, 2899, 2920, 2939, 2940, 2948, 2955, 2960, 2963, 2965, 3270, 3300, 3507, 3932  
**Social Class** [See also Lower Class, Middle Class, Upper Class] 2880, 2949, 2995, 3017  
**Social Dating** 3807  
**Social Deprivation** [See also Social Isolation] 2805, 2907, 3055  
**Social Desirability** 3022, 3039, 3139, 3142, 3157, 3284  
**Social Environments** [See also Animal Environments, Classroom Environment, College Environment, Communes, Communities, Ghettos, Home Environment, Kibbutz, Rural Environments, School Environment, Suburban Environments, Urban Environments, Working Conditions] 3389, 3418  
**Social Equality** 2526, 3376, 4154

**Social Facilitation** 2988  
**Social Groups** [See Dyads, Minority Groups]  
**Social Influences** [See also Ethnic Values, Power, Religious Prejudices, Social Approval, Social Desirability, Social Values, Superstitions] 2930, 3139, 3206, 3230, 3252, 3378, 3401, 3653, 3680, 3926  
**Social Interaction** [See also Assistance (Social Behavior), Bargaining, Charitable Behavior, Collective Behavior, Conflict, Conversation, Cooperation, Eye Contact, Group Discussion, Group Participation, Group Performance, Interpersonal Attraction, Interpersonal Communication, Interpersonal Influences, Interpersonal Interaction, Interviewing, Interviews, Job Applicant Interviews, Negotiation, Participation, Peer Relations, Psychodiagnostic Interview, Social Dating, Victimization, Violence, War] 2890, 2987, 3017, 3384, 3776  
**Social Isolation** 2483, 2488, 2598, 2785, 2790, 2797, 2802, 2810  
**Social Learning** [See also Imitation (Learning), Imprinting] 4099  
**Social Maladjustment** [See Social Adjustment]  
**Social Movements** [See also Activist Movements, Student Activism, Womens Liberation Movement] 2943, 3550  
**Social Perception** [See also Attribution] 2372, 2841, 2857, 2886, 2888, 2893, 2908, 2938, 2971, 2983, 2996, 3002, 3010, 3012, 3013, 3018, 3022, 3023, 3024, 3026, 3028, 3032, 3035, 3036, 3037, 3039, 3046, 3047, 3049, 3050, 3100, 3133, 3642  
**Social Processes** [See also Immigration, Industrialization, Racial Integration, School Integration (Racial), Social Deprivation, Social Isolation, Socialization] 2944, 2960, 3021  
**Social Psychology** 2979, 2986  
**Social Reinforcement** [See also Praise, Verbal Reinforcement] 3055, 3719, 4048  
**Social Sciences** [See also Anthropology, Community Psychology, Comparative Psychology, Consumer Psychology, Counseling Psychology, Developmental Psychology, Educational Psychology, Industrial Psychology, Neuropsychology, Psychology, School Psychology, Social Psychology, Sociology] 2110, 4202  
**Social Stress** 2498  
**Social Structure** [See also Lower Class, Middle Class, Social Class, Upper Class] 2867, 2889, 2954  
**Social Values** 2894, 2899, 2940, 2941, 2950, 2952, 3010, 3037, 3224  
**Social Work** [See Social Casework]  
**Social Workers** 3866, 3891  
**Socialism** 2962  
**Socialization** 2895, 3387, 4205  
**Socially Disadvantaged** [See Disadvantaged]  
**Sociocultural Factors** [See also Cross Cultural Differences, Culture Change, Ethnic Identity, Ethnic Values] 2912, 2920, 2929, 2933, 3057, 3270, 3291, 3360, 3369, 3399, 3886, 3925, 3930  
**Socioeconomic Status** [See also Family Socioeconomic Level, Lower Class, Lower Income Level, Middle Class, Social Class, Upper Class] 2831, 2837, 2840, 2866, 2971, 2972, 3252, 3396, 3866, 3936, 4024, 4031, 4109, 4147

**Sociology** 2134  
**Sociopath** [See Antisocial Personality]  
**Sociopathology** [See Antisocial Behavior]  
**Sodium** 2572  
**Sodium Pentobarbital** [See Pentobarbital]  
**Somatosensory Evoked Potentials** 2442, 2650  
**Somesthetic Perception** [See also Cutaneous Sense, Kinesthetic Perception, Pain Perception, Pain Thresholds, Tactile Perception, Temperature Perception] 2202, 2210, 3290  
**Somesthetic Stimulation** [See also Tactile Stimulation] 4170  
**Somnambulism** 3330, 3814  
**Sons** 3383  
**Sorting (Cognition)** [See Classification (Cognitive Process)]  
**Sound** [See Auditory Stimulation]  
**Sound Localization** [See Auditory Localization]  
**Sound Pressure Level** [See Loudness]  
**Sourness** [See Taste Stimulation]  
**South America** 2105  
**Southeast Asia** 3296, 3418, 3859  
**Space (Personal)** [See Personal Space]  
**Spatial Discrimination** [See Spatial Perception]  
**Spatial Organization** 2312, 2710  
**Spatial Orientation (Perception)** 2196, 2250, 2253, 2264, 2274, 2276, 2278, 2389, 2566, 2818, 3536  
**Spatial Perception** [See also Apparent Movement, Autokinetic Illusion, Depth Perception, Distance Perception, Motion Perception, Size Discrimination, Spatial Organization, Spatial Orientation (Perception), Stereoscopic Vision] 2189, 2205, 2244, 2269, 2279  
**Special Education** 3604, 3831, 3964, 3977, 4020, 4046, 4047, 4048, 4050, 4051, 4052, 4053, 4054, 4056, 4057, 4058, 4060, 4061, 4064, 4065, 4095  
**Special Education (Aurally Handicap)** [See Aurally Handicapped, Special Education]  
**Special Education (Emot Disturbed)** [See Emotionally Disturbed, Special Education]

The Author Index is intended to be a name index only and not a person index. "Adams, P" will be listed separately from "Adams, Paul" even though the names may refer to the same person; however, two listings for "Adams, P." may refer to two different authors. All authors are listed, not just primary authors.

## KEY TO THE TEXT

The examples of different types of *Psychological Abstracts* records presented here are number coded to provide definition of their elements.

### JOURNAL ARTICLE ABSTRACT

<sup>1</sup> 8327. <sup>2</sup> Howard, R. Lee.; Glendenning, Robert L. & Meyer, Donald R. <sup>3</sup> (Ohio State U) <sup>4</sup> Motivational control of retrograde amnesia: Further explorations and effects. <sup>5</sup> *Journal of Comparative & Physiological Psychology*, 1974 (Feb). Vol. 86(2), 187-192. <sup>6</sup> Reports 5 investigations of variables related to the motivational control of retrograde amnesia for long-term habits, which result from single electroconvulsive shock treatments. Ss were 176 Long-Evans rats. In terms of the paradigms of M.J. Robbins and D.R. Meyer<sup>7</sup> (see PA Vol. 44:11961), habits that were 3rd in a series were generally resistant to the treatment and were markedly impaired if the tests for retention were carried out in changed motivational contexts. The latter result is discussed in relation to the view that long-term habits are affected by the treatments if and only if, they operate as punishments. (<sup>8</sup>) (<sup>9</sup>) (15 ref) <sup>10</sup> *Journal abstract*.

- 1 - Record number.
- 2 - Author(s) or editor(s). As many as four are listed; if there are more than four, the first is listed followed by "et al." Succession marks (i.e., Jr., II, III, etc) are not given.
- 3 - Affiliation of first-named author/editor only.
- 4 - Article title, including subtitles: If the original article is in a foreign language, the translated title is given in brackets and the language of the original article is indicated in parentheses.
- 5 - Primary publication title and bibliographic data.
- 6 - Text of abstract.
- 7 - Reference to a previous entry in *Psychological Abstracts*. If an abstract number is unavailable at time of publication, the issue number is given. Consult the Author Index of the PA issue noted in order to determine the record number for the article.
- 8 - Summaries included in the primary publication are listed when in language(s) other than that of the article.
- 9 - Number of references is included when there are 15 or more listed.
- 10 - Abstract source.

### BOOK ANNOTATION

<sup>1</sup> 8328. <sup>2</sup> Chase, William G. <sup>3</sup> (Ed). <sup>4</sup> (Carnegie-Mellon U) <sup>5</sup> Visual information processing. <sup>6</sup> New York, NY; <sup>7</sup> Academic, <sup>8</sup> 1973. <sup>9</sup> xiv, <sup>10</sup> 555 p. <sup>11</sup> \$17.50. <sup>12</sup> Presents a series of readings on visual processes in cognition and linguistic comprehension and on information-processing models.

- 1 - Record number.
- 2 - Author(s) or editor(s). As many as four are listed; if there are more than four, the first is listed followed by "et al." Succession marks (i.e., Jr., II, III, etc) are not given.
- 3 - Designation of editor.
- 4 - Affiliation of first named author/editor only.
- 5 - Book title: If the book is in a foreign language, the original title is given followed by a translated title and the language of the book is indicated in parentheses.
- 6 - Place of publication.
- 7 - Publisher.
- 8 - Year of publication.
- 9 - Prepagination.
- 10 - Total pagination.
- 11 - Price.
- 12 - Text of annotation.

### BOOK CHAPTER CITATION

<sup>1</sup> 8329. <sup>2</sup> Clark, Herbert H.; Carpenter, Patricia A. & Just, Marcel A. <sup>3</sup> (Stanford U) <sup>4</sup> On the meeting of semantics and perception. <sup>5</sup> In W.G. Chase (Ed), *Visual information processing*, New York, NY: Academic, 1973. xiv, 555 p. \$17.50.

- 1 - Record number.
- 2 - Author(s) of cited chapter. As many as four are listed, if there are more than four, the first is listed followed by "et al." Succession marks (i.e., Jr., II, III, etc) are not given.
- 3 - Affiliation of first named author only.
- 4 - Chapter title.
- 5 - Referral to the whole book and its bibliographic data.

## CONTENT CLASSIFICATION

PA has subsections for some of the 17 major classification categories. These are displayed in the Table of Contents and are designed to group all abstracts relevant to a narrower topic than the major categories under a single heading. Abstracts that are relevant to a major category but not to any of the subsections are listed first and followed by abstracts that are relevant both to a major category and also to the subsections. It is expected that this will help readers locate material related to their interests more quickly.

## ABBREVIATIONS

In addition to commonly understood abbreviations\* (including all units of measurement, educational degrees, standard statistical abbreviations, and standard Latin and reference terms), standard abbreviations used in *Psychological Abstracts* records are:

ACTH	= adrenocorticotrophic hormone	NREM	= nonrapid eye movement
DNA	= deoxyribonucleic acid	REM	= rapid eye movement
E	= experimenter	RNA	= ribonucleic acid
EEG	= electroencephalogram or -graph	S	= subject
ESP	= extrasensory perception	TV	= television
Exp	= experiment	US	= United States
IQ	= intelligence quotient	USSR	= Union of Soviet Socialist Republics
LSD	= lysergic acid diethylamide	WAIS	= Wechsler Adult Intelligence Scale
MMPI	= Minnesota Multiphasic Personality Inventory	WISC	= Wechsler Intelligence Scale for Children

Computer languages and computer names will also be used without definition, e.g., ALGOL, COBOL, FORTRAN, IBM 360.

Language abbreviations used after translated titles are:

Afri	= Afrikaans	Geor	= Georgian	Port	= Portuguese
Alba	= Albanian	Germ	= German	Romn	= Romanian
Arab	= Arabic	Grek	= Greek	Russ	= Russian
Bulg	= Bulgarian	Hebr	= Hebrew	Slov	= Slovene
Chin	= Chinese	Hung	= Hungarian	Slok	= Slovak
Czec	= Czech	Iran	= Iranian	Span	= Spanish
Danh	= Danish	Ital	= Italian	Srccr	= Serbo-Croatian
Duth	= Dutch	Japn	= Japanese	Swed	= Swedish
Finn	= Finnish	Lith	= Lithuanian	Turk	= Turkish
Flem	= Flemish	Norg	= Norwegian	Ukrn	= Ukrainian
Fren	= French	Polh	= Polish	Yugo	= Yugoslavian

# PSYCHOLOGICAL ABSTRACTS

Volume 53

March 1975

Number 3

## GENERAL

4251. Altner, Günter (Ed.). *The human creature*. Garden City, NY: Anchor, 1974. viii, 467 p. \$3.50.

—Presents a collection of 12 papers which analyze the nature of man as a "creature," how he is controlled or influenced by biological laws, and how he has shaped his existence. Topics include the early cultural development of man, his use of tools, and social Darwinism as an example of the abuse of scientific knowledge. (17 p ref)

4252. Bem, Daryl J. & Allen, Andrea. (Stanford U) *On predicting some of the people some of the time: The search for cross-situational consistencies in behavior*. *Psychological Review*, 1974(Nov), Vol 81(6), 506-520.

—The historically recurring controversy over the existence of cross-situational consistencies in behavior is sustained by the discrepancy between intuitions, which affirm their existence, and the research literature, which does not. It is argued that the nomothetic assumptions of the traditional research paradigm are incorrect, and that by adopting some of the idiographic assumptions employed by intuitions, higher cross-situational correlation coefficients can be obtained. A study with 64 undergraduates is reported which shows that it is possible to identify on a priori grounds those individuals who will be cross-situationally consistent and those who will not. It is concluded that not only must personality assessment attend to situations—as has been recently urged—but to persons as well. (52 ref)—*Journal abstract*.

4253. Brechner, Kevin C.; Linder, Darwyn E.; Meyerson, Lee & Hays, Victor L. (Arizona State U) *A brief report on a device for unobtrusive visual recording*. *Journal of Applied Behavior Analysis*, 1974(Fal), Vol 7(3), 499-500.

—Describes a portable, inexpensive device for making film or videotape recordings of Ss in field or laboratory settings without arousing Ss' suspicion. A camera is enclosed in a box with the lens close to an aluminum shade screen (rather than a 1-way mirror). Tests with undergraduates show the device was effective in concealing the camera.

4254. Brown, Phil (Ed.). *Radical psychology*. New York, NY: Harper & Row, 1973. xxii, 548 p. \$2.95.

—Presents a collection of 28 papers on the theory and practice of radical psychology written by leaders of the radical movement in psychiatry and psychology. Topics include sociological approaches to psychology, antipsychiatry, the Marxist foundations of psychology, sex roles in psychiatry and psychotherapy, and methods of "fighting back" against the mental health and research establishment. (6½ p ref)

4255. Carella, Michael J. (San Diego State Coll) *Psychoanalysis and the mind-body problem*. *Psychoanalytic Review*, 1974(Spr), Vol 61(1), 53-61.—Examines

Freud's topological model of conscious, preconscious, and unconscious, and his revised model of id, ego, and superego, within the historical context of mind-body dualism. In classical Cartesian mind-body dualism and in Kant's later parallelism, there is an isomorphism between physical events and events of consciousness. In both, mind is identified with consciousness. Classical physics was traditionally formulated within this dualism until the early 20th century, at the time when Freud was formulating his theories. Freud's assumption of unconscious mental states challenged the identification of mind with consciousness in classical dualism. Freud adhered rather to a methodological dualism involving separate but complementary levels of discourse, the descriptive and the explanatory. For Freud, the unconscious is on the explanatory level of discourse, so that mind is an explanatory construct rather than equated with consciousness as in classical dualism.—*B. Smith*.

4256. Chadwick-Jones, J. K. (University Coll Wales, Occupational Psychology Research Unit, Cardiff) *Logical reduction and social psychology*. *Journal for the Theory of Social Behaviour*, 1973(Apr), Vol 3(1), 3-21.

—Discusses the relationship between social explanations and psychological propositions. Attempts at integrating the concepts of these 2 approaches are described with reference to their theoretical position. The issue of reductionism is discussed. The question is raised whether there are autonomous social-psychological theories. The concept of reinforcement in behavior studies is compared to the concept of resonance in a social context. Additional research is considered necessary if social psychology is to have autonomy over its subject matter. (44 ref)—*R. S. Albin*.

4257. Dansart, Bernard R. (Loras Coll) *Existentialism in the thought of David V. Tiedeman*. *Character Potential*, 1974(Oct), Vol 7(1), 1-8.—Reviews and synthesizes the concepts of Tiedeman and existential psychologists. Tiedeman, the existentialist, sees the ultimate in decision-making as centering oneself in the decision process itself with awareness of self and situation.

4258. Ferster, C. B. (American U) *The difference between behavioral and conventional psychology*. *Journal of Nervous & Mental Disease*, 1974(Sep), Vol 159(3), 153-157.—Describes behavioral psychology as a complement rather than a substitute for clinical psychology. The contradictory aspects come from procedures using arbitrary rather than natural reinforcers. Behavioral language and concepts serve to make clinical procedures communicable and sharpen and define clinical practice. Clinical theory deals with the developmental aspects of life whereas behavioral theory provides the means for a fine-grain description. (20 ref)—*Journal abstract*.

4259. **Huck, Schuyler W. & Sutton, Cary O.** (U Tennessee) **The relationship between sample sizes and the power of  $X^2$  in  $2 \times 2$  contingency tables.** *Journal of Experimental Education*, 1974(Fal), Vol 43(1), 53.—Briefly discusses the importance of using equal  $n$ 's in posttest-only control group experimental designs and how different interpretations of the same data can be drawn by the researcher when the number of Ss in the experimental group differs from that of the control group.
4260. **Kefalas, Asterios G. & Suojanen, Waino W.** (U Georgia) **Organizational behavior and the new biology.** *Academy of Management Journal*, 1974(Sep), Vol 17(3), 514-527.—Although management theorists and practitioners have accepted the model of man which assumes an almost infinite capacity for education and adjustment, recent evidence from ethology studies suggests that this assumption may be misleading and dangerous. It is proposed that there are constraints set by man's genetic endowments which determine his educability. (27 ref)
4261. **Kilian, C. J.** [Significance of space and time in pedagogic thinking.] (Afri) *Suid-Afrikaanse Tydskrif vir die Pedagogiek*, 1974(Jul), Vol 8(1), 9-21.—Contents that in analyzing the pedagogic significance of space and time, certain distinctions should be made between geometric and personal space and between chronometric and existential time. These concepts are discussed in relation to the educator's function of increasing awareness and the experience of "being in the world."
4262. **Lambrechtsen, Erik.** [Age-change or age differences? Concerning investigation strategies in developmental psychology.] (Danh) *Skolepsykologi*, 1974, Vol 11(5), 410-417.—Rejects the traditional cross-sectional and longitudinal strategies arguing for a combination in the form of sequential sampling of Ss. In the discussion of validity, the concept of cohort is central.
4263. **Magdol, Miriam S.** (Potsdam Child Development Ctr, NY) **Problems in attention: Clearing up the terminology.** *Academic Therapy*, 1972-1973(Win), Vol 8(2), 141-153.—Proposes that the behavioral terms "distractibility" and "short attention span" are oversimplified and used synonymously in the literature. A separation of the terms is proposed which distinguishes between interference from internal and external stimuli and educational strategies are suggested which correspondingly distinguish and isolate the 2 behavioral characteristics. (26 ref)—*M. E. Blankenship.*
4264. **Mall, R. A.** **On reflection and negation.** *Philosophy & Phenomenological Research*, 1974(Sep), Vol 35(1), 79-92.—Presents arguments to show that negation is conceptual (i.e., an iterative or reflective process of critical thought) rather than perceptual, operational, intentional, or metaphysical. Negation is described as "the imagined presence" of a perceptually absent object."
4265. **Mixon, Don.** (U Nevada) **Instead of deception.** *Journal for the Theory of Social Behaviour*, 1972(Oct), Vol 2(2), 145-177.—Discusses the deception often used by social psychologists in experiments with human subjects. It is suggested that this deception attempts to place the human subject in the position of a naively responding automatic mechanism. The moral and methodological problems are examined. Role-playing is presented as an alternative approach. 2 studies of active role-playing are reported and contrasted in detail with S. Milgram's 1963 obedience study. It is felt that active role-playing studies can permit the testing of theory-based, situationally specific predictions concerning performance. (33 ref)—*R. S. Albin.*
4266. **Morris, John L. & Diespecker, Don D.** (Wollongong U Coll, NSW, Australia) **Apparatus for studying bisensory learning rates in man/machine systems.** *Australian Journal of Psychology*, 1974(Aug), Vol 26(2), 85-88.—Describes an apparatus for studying learning rates in a simulated industrial or machine control environment. 4 channels of signals are produced which activate either a light source, dials (meters), a vibrotactile unit, or all of these displays in combination on each channel. Input to the displays is by tape-recorded signals of varying intensities. The occurrence of a stimulus signal and the response to it are recorded on a multiple channel event-recorder. The apparatus is intended to facilitate research into the bisensory presentation of signals.—*Journal abstract.*
4267. **Quereshi, M. Y.** (Marquette U) **Purposes and procedures of validation.** *Journal of Psychology*, 1974(Sep), Vol 88(1), 77-89.—Defines validation as a general scientific procedure for investigating the nature of reality, encompassing all scientific disciplines, regardless of the utilitarian value of the information. When the process is employed in the context of a discipline such as psychology, certain subcategories emerge whose interrelations, if viewed in the light of possible or intended uses of the collected information, demonstrate the interdependence of a variety of validation procedures. Some of these have been viewed in the past as separate entities. A hierarchical representation of purposes and procedures is presented to facilitate an understanding of their interrelations and interdependence.—*Journal abstract.*
4268. **Rogo, D. Scott.** **Parapsychology: Is contributions to the study of death.** *Omega: Journal of Death & Dying*, 1974(Sum), Vol 5(2), 99-113.—Considers that a major topic with which parapsychology has been historically associated is whether psychic phenomena indicate that man survives death and communicates with the living. The historical roots of the association between the study of death and parapsychology are reviewed, and several specific areas of parapsychology which bear on the phenomenon of death are discussed. (35 ref)
4269. **Rothgeb, Carrie L. (Ed.).** **Abstracts of the standard edition of the complete psychological works of Sigmund Freud.** New York, NY: International Universities Press, 1973. ix, 572 p.
4270. **Szafran, A. W.** (Free U, Brussels, Belgium) [Reflections on Lacanian philosophy and esoteric tradition.] (Fren) *Acta Psychiatrica Belgica*, 1973(Jul), Vol 73(4), 484-496.
4271. **Thorndike, Edward L.** **Human nature and the social order:** (Edited & abridged by G. J. Clifford). Cambridge, MA: MIT Press, 1969. xxv, 373 p.
4272. **Watanabe, Satoshi.** (U Hawaii) **Logic of the empirical world with reference to identity theory and reductionism.** *Annals of the Japan Association for Philosophy of Science*, 1974(Mar), Vol 4(4), 253-270.—Contents that since observation changes the system

being observed, neither physics, biology, nor psychology can be based on binary arguments, which are true or false. A logic intended to separate the inseparable is proposed to deal with continuous states by starting from a continuously-valued characteristic function. (23 ref)

## PSYCHOMETRICS AND STATISTICS

4273. Becker, Johannes & Pipahl, Werner. (U Dueseldorf, Psychologisches Inst II, W Germany) **The additive difference model and a metric and an ordering on sets.** *Psychometrika*, 1974(Sep), Vol 39(3), 361-362.—Demonstrates that, despite differences between the additive difference model and the set-theoretical model on the generation of similarity judgments, both models lead to the same conclusions on the characteristics of similarity judgments. As a consequence of empirical results, the possibility is considered that the nested structure assumption is a necessary condition for decomposability of similarity judgments.

4274. Dana, Richard H. & Leech, Shirley. (U Arkansas) **Existential assessment.** *Journal of Personality Assessment*, 1974(Oct), Vol 38(5), 428-435.—A review of the literature indicates that present day psychological assessment stems from a philosophy of science that values objectivity but fails to comprehend the existence of the person being evaluated. A humanistic-existential model shifts the focus from omnipotence to encounter and encourages client responsibility. The vehicle for this conceptualization is the nature and meaning of the encounter between clinician and client. New questions are posed for the assessor by altering the assessment goals, the stance toward interpretation, and the criterion for validation. (41 ref)—*Journal abstract*.

4275. Epps, Edgar G. (U Chicago) **Situational effects in testing.** In L. P. Miller (Ed), *The Testing of black students: A symposium*. Engelwood Cliffs, NJ: Prentice-Hall, 1974. x, 113 p.

4276. Goldman, Bert A. & Saunders, John L. (U North Carolina, Greensboro) **Directory of unpublished experimental mental measures: I.** New York, NY: Behavioral Publications, 1974. xiv, 223 p.

4277. Green, Paul E. (U Pennsylvania, Wharton School) **On the design of choice experiments involving multifactor alternatives.** *Journal of Consumer Research*, 1974(Sep), Vol 1(2), 61-68.—Empirical studies of multifactor choice making can easily generate thousands of combinations if full factorial designs are used. A set of procedures—orthogonal arrays and incomplete block designs—are proposed and illustrated as ways to reduce significantly the number of combinations while retaining other desirable features of balanced experimental designs. (20 ref)

4278. Krantz, David H.; Atkinson, Richard C.; Luce, R. Duncan & Suppes, Patrick (Eds.). (U Michigan) **Contemporary developments in mathematical psychology: II. Measurement, psychophysics, and neural information processing.** San Francisco, CA: W. H. Freeman, 1974. xv, 468 p. \$14.—Presents the 2nd volume in a symposium on recent progress in mathematical psychology research, methodology, and interpretation. Topics include the analysis of psychological data by structural

analysis of covariance matrices, models and methods of 3-way multidimensional scaling foundations of Fechnerian psychophysics, measurement theory and qualitative laws in psychophysics, and information integration theory.

4279. Krantz, David H.; Atkinson, Richard C.; Luce, R. Duncan & Suppes, Patrick (Eds.). (U Michigan) **Contemporary developments in mathematical psychology: I. Learning, memory and thinking.** San Francisco, CA: W. H. Freeman, 1974. xiii, 299 p. \$9.

4280. Lantermann, Ernst D. [A proposal for modifying the irrelevance criterion.] (Germ) *Zeitschrift für Experimentelle und Angewandte Psychologie*, 1974, Vol 21(1), 115-125.—Discusses the objective criterion of irrelevance in attitude scales as defined by Thurstone's and by A. L. Edwards's different approaches to the problem. The deterministic decision models which underly both approaches are replaced by a stochastic model which facilitates interpretation in cases of deviation from the theoretical model. An example shows the practicability of the stochastic model. (English & French summaries)

## Test Construction & Validation

4281. Butcher, James N. & Gur, Raya. (U Minnesota) **A Hebrew translation of the MMPI: An assessment of translation adequacy and preliminary validation.** *Journal of Cross-Cultural Psychology*, 1974(Jun), Vol 5(2), 220-227.—Translated the MMPI into Hebrew and verified its adequacy by administering both the English and Hebrew forms to 28 Hebrew-English bilingual students and professionals. Scale intercorrelations and item stability were quite high and compared favorably with English-English retest studies and other foreign-language translations. Comparability was further evaluated by examining endorsement differences between an Israeli sample of 65 normal female college students and US normals. The similarity of group mean profiles for the 2 normal groups suggests that this translation performs in Israel as it does in the US.—*Journal abstract*.

4282. Davis, Everett E. & Rowland, Terrence. (U Texas, El Paso) **A replacement for the venerable Stanford-Binet?** *Journal of Clinical Psychology*, 1974(Oct), Vol 30(4), 517-521.—Current interest in early childhood education has spurred efforts to produce tests of the general mental ability of young children that will be as productive as the Stanford-Binet and at the same time avoid some of its weaknesses, which have become evident over the years. Results of testing 1 black-American, 12 Mexican-American, and 20 Caucasian-American children with both the McCarthy Scales of Children's Abilities (MSCA) and the Stanford-Binet Intelligence Scale provide the basis for a discussion of the 2 tests. It is concluded that many workers probably will prefer the structure of the MSCA, and evidence is presented for the tentative judgment that the MSCA yields scores that parallel Binet IQs.—*Journal summary*.

4283. Farely, Frank H. & Cohen, Arie. (U Wisconsin, Madison) **Common-item effects and the smallest space analysis of structure.** *Psychological Bulletin*, 1974(Nov), Vol 81(11), 766-772.—Critically reviews procedures for the analysis of common-item effects on interscale structure. A study using smallest space analysis of such effects is described. It employed an original California

Psychological Inventory scale intercorrelation matrix (with both common and unique items included) and a matrix based only on common-elements correlations between scales. Results indicate strong effects on structure of item overlap and suggest the generalization to smallest space analysis and related multidimensional scaling procedures of J. P. Guilford's 1952 admonition to avoid the factor analysis of test scales containing overlapping items. A distinction between common-item effects on magnitude of correlations and structure of intercorrelations between scales is discussed. It is argued that this distinction, aligned with a proposed research design, would aid in deciding when to use techniques such as factor analysis and smallest space analysis, including which technique is to be preferred under what conditions. (22 ref)—*Journal abstract*.

4284. Gough, Harrison G. & Lazzari, Renato. (U California, Inst of Personality Assessment & Research, Berkeley) **A 15-item form of the F scale and a cross-cultural application.** *Journal of Psychology*, 1974(Sep), Vol 88(1), 39-46.—Results of item analyses of the 30-item California F Scale (Fascism) in a sample of 355 Ss (mostly college students), and proportionate selection from the 9 inferential item clusters first specified for this measure, permitted development of a 15-item version that correlated .95 with the original scale. Application of the shortened version to 194 American and 311 Italian college students produced nearly equivalent means, but there was greater variance in the Italian sample. Reliability coefficients were .83 for the Americans and .90 for the Italians. 5 items revealed significant differences, interpretable in accordance with known cultural emphases and historical experiences. Testing time for the 15-item scale was approximately 5 min. Complaints about item content were less insistent than typically encountered with the 30-item scale.—*Journal abstract*.

4285. Gough, Harrison G. & Quintard, Georges. (U California, Berkeley) **A French application of the CPI social maturity index.** *Journal of Cross-Cultural Psychology*, 1974(Jun), Vol 5(2), 247-252.—A social maturity index based on 6 subscales of the California Psychological Inventory was developed based on samples of 2,146 nondelinquent and 881 delinquent males. The index was cross-validated on 2,482 nondelinquent vs 409 delinquent American males, 659 nondelinquent vs 38 delinquent Italian males, and 113 Japanese male nondelinquents vs 36 delinquents. All mean differences were highly significant, and Ss in the 3 cross-validating samples were classified with percentage accuracies of 92.3 (American), 83.8 (Italian), and 83.2 (Japanese) by a cutting score of 45. New results for 1,270 males and 391 females tested with a French edition of the index gave similarly positive findings, with classificatory hit rates of 86.2% for males and 90.3% for females.—*Journal abstract*.

4286. Keats, J. A. (U Newcastle, England) **Applications of projective transformations to test theory.** *Psychometrika*, 1974(Sep), Vol 39(3), 359-360.—Extends the theory of projective transformations to G. Rasch's 1960 model for representing test performances and applies it further to allow for guessing behavior. It is suggested that the cross-ratio property of projective transformations has application in deciding whether or

not some form of projective transformation would be appropriate in converting proportions of correct responses to estimates of ability.

4287. Knudson, Roger M. & Golding, Stephen L. (U Illinois, Psychological Clinic) **Comparative validity of traditional versus S-R format inventories of interpersonal behavior.** *Journal of Research in Personality*, 1974 (Aug), Vol 8(2), 111-127.—Evaluated the comparative validity of 2 "stimulus-response (S-R)" inventories of interpersonal behavior—the Schedule of Interpersonal Response by J. F. Kinnane et al and a newly developed Rational S-R Inventory—and 2 "traditional" inventories—the Personality Research Form and the Interpersonal Check List—with respect to 14 self-report and peer rating criteria selected to tap broadly the interpersonal domain. 64 male and female high school seniors served as Ss. In spite of the situational specificity inherent in the S-R inventories, the traditional inventories substantially outperformed the S-R inventories and, in contrast to previous findings, also outperformed simple self-ratings. The relative advantages of various inventory construction strategies, the problem of criterion measurement, and theoretical and methodological issues in the assessment of situational parameters are discussed. (54 ref)—*Journal abstract*.

4288. Lord, Frederic M. (Education Testing Service, Princeton, NJ) **The relative efficiency of two tests as a function of ability level.** *Psychometrika*, 1974(Sep), Vol 39(3), 351-358.—Develops a new formula for the relative efficiency of 2 tests measuring the same trait. The formula expresses relative efficiency solely in terms of the standard errors of measurement and, surprisingly, the frequency distributions of true scores. Approximate methods for estimating relative efficiency may make this function routinely available. A numerical illustration compares new and old estimates of relative efficiency for subtests from the Scholastic Aptitude Test.—*Journal abstract*.

4289. Meurer, Klaus. (U Kiel, Inst of Psychology, W Germany) **[Development of a nonverbal analogy test based on set theory.]** (Germ) *Zeitschrift für Experimentelle und Angewandte Psychologie*, 1974, Vol 21(1), 126-131.—Constructed a series of 20 progressively difficult analogy problems which consisted of object sets of figures varying in form and color. The multiple-choice set of alternative answers contained, in addition to the correct and false alternatives, alternatives which were half correct, thus allowing conclusions to be made about the dominant stimulus dimension which had prompted the selection of a particular alternative. The validity of the analogy test was established by its high correlation with W. Horn's Performance Test. (English & French summaries)—*W. J. Koppitz*.

4290. Shah, J. H. (Saurashtra U, Bhavnagar, India) **Gujarati adaptation and standardization of the Stanford-Binet Intelligence Scale (1960 revision): Form L-M.** *Indian Journal of Psychometry & Education*, 1973(Dec), Vol 4(2), 67-82.—Adapted and standardized the 3rd revision of the Stanford-Binet Intelligence Scale (Form L-M) on Gujarati population. Tests were translated into the Gujarati language, reviewed by psychometricians, pretested on 220 Ss, revised, and finally standardized on 400 Gujarati-speaking persons stratified by age, sex,

socioeconomic status, and parents' occupation, to represent the population. The adapted scale was validated against the results of other psychological tests, school marks in academic subjects only, and teachers' judgments of an individual's intelligence. Coefficients ranged from a low of .55 to a high of .87, suggesting that the scale possesses a fairly high degree of validity.—J. B. Francis.

4291. Switras, Joseph E. (Iowa State U) **A comparison of the eye-roll test for hypnotizability and the Stanford Hypnotic Susceptibility Scale: Form A.** *American Journal of Clinical Hypnosis*, 1974(Jul), Vol 17(1), 54-55.—Compared the Eye-Roll Test for hypnotizability with the Stanford Hypnotic Susceptibility Scale (Form A). They were found to be uncorrelated.

4292. Trimmer, Harvey & Klein, Freda. (Nevada Employment Security Dept, Carson City) **Wooden vs plastic apparatus with the GATB: A restudy.** *Journal of Employment Counseling*, 1974(Sep), Vol 11(3), 123-126.—Attempted to replicate a study by J. T. Kapes and N. W. Sievert (see PA, Vol 52:9115) which found a mean difference of 11 points (1 standard error) between wooden and plastic peg boards for the General Aptitude Test Battery (GATB). Although the Kapes and Sievert study used 9th graders as Ss, the present study used 388 applicants (over 18 yrs of age) to a state employment office. Ss were tested in groups of 10 and were randomly assigned to each type of pegboard. Results support the previous finding that the use of a wooden or plastic pegboard is systematically related to performance on the GATB Manual Dexterity measure. There were no significant sex or race differences. It is recommended that wooden boards and pegs be used exclusively when testing with the GATB and that the Manual Dexterity factor be interpreted with caution by future users of the test battery.—L. Gorsey.

4293. Wagener, J. Mark. (Oregon State U) **An experimental scale of social competence for adult males.** *Journal of Personality Assessment*, 1974(Oct), Vol 38(5), 462-463.—Developed the 21-item Life Experience Scale (LES) as an expansion of the process-reactive distinction so that this concept could be applied to nonschizophrenics. Scores were unrelated to age or to socioeconomic status for 3 different samples of males. A comparable range of LES scores was found for schizophrenic, alcoholic, and normal groups.

#### Mathematical Models & Statistics

4294. Acock, Alan C. & Martin, J. David. (U Southern California) **The undermeasurement controversy: Should ordinal data be treated as interval?** *Sociology & Social Research*, 1974(Jul), Vol 58(4), 427-433.—Discusses the undermeasurement controversy which concerns treating ordinal data as interval when an underlying interval level variable is assumed to exist. The position of the "purists" who insist on limiting such data to ordinal analysis is contrasted to the "pragmatists" who treat the data as if it were interval.—*Journal abstract*.

4295. Anderson, Jonathan & Hansford, B. C. (Flinders U South Australia, Bedford Park) **An information processing procedure for scoring Flanders' interaction analysis categories.** *Journal of Experimental Education*, 1974(Fal), Vol 43(1), 6-10.—Investigated the use of an

alternative method (J. McLeod and J. Anderson's Uncertainty Reduction Index) for scoring N. A. Flanders's Interaction Analysis categories when student competence in coding lesson transcripts is being assessed. Unlike scoring procedures for many behavior category systems, the Uncertainty Reduction Index (URI) weights S's responses in proportion to the degree of uncertainty exhibited by all Ss responding to a given segment of verbal behavior. A comparison was made between the responses of 222 undergraduates when scoring transcripts of verbal behavior with the Flanders system and with the URI. Results indicate the usefulness of the URI particularly in situations where there is confusion or disagreement about how a certain portion of a verbal transcript should be coded.—L. Gorsey.

4296. Bechtoldt, Harold P. (U Iowa) **A confirmatory analysis of the factor stability hypothesis.** *Psychometrika*, 1974(Sep), Vol 39(3), 319-326.—The procedures recently developed by K. G. Jöreskog for studying similarities and differences in factor structures between different groups are applied to data from a study designed by L. L. Thurstone to investigate the sampling stability of a hypothesized isolated configuration. The hypothesis of an isolated configuration is rejected but not by much. Results represent a restricted and unique simple structure solution with the factor loadings and uniqueness values invariant over the 2 samples. (22 ref) —*Journal abstract*.

4297. Bergman, Lars R. **Linear transformations and the study of change.** *Reports from the Psychological Laboratories, University of Stockholm*, 1972(May), No 352, 7 p.—Considers the situation with measurements from 2 points in time where the scores are linearly transformed separately at each time of measurement. Special attention is given to the case when the scores are transformed to yield equal means and variances. When studying mean changes between groups, and when studying the correlation between change and another variable, the apparent tendency of an individual's results may be reversed when the scores are transformed. In those cases, treated in the present paper, when the initial scores are controlled for, the results are invariant under linear transformations. It is suggested that for this and other reasons it appears important to control for the initial values.—*Journal abstract*.

4298. Birnbaum, Michael H. (U Illinois) **Reply to the devil's advocates: Don't confound model testing and measurement.** *Psychological Bulletin*, 1974(Nov), Vol 81(11), 854-859.—E. F. Alf and N. M. Abrahams (1974) and L. G. Rorer (1974) replied to the present author's 1973 criticism of correlational methods by defending the correlation-regression approach to model testing, contending that if a priori measurements are assumed to be proper psychological values and if the correct model is known, correlations can be higher for the better model. The present article argues that since psychologists cannot know in advance the correct scales and models, popular correlational techniques are inappropriate for investigating psychological processes. It is necessary to separate measurement from the evaluation of a model. A further attempt is made to clarify the relationships between different methods of analysis. (18 ref)—*Journal abstract*.

4299. **Bloxom, Bruce.** (Vanderbilt U) **An alternative method of fitting a model of individual differences in multidimensional scaling.** *Psychometrika*, 1974(Sep), Vol 39(3), 365-367.—Application of K. G. Jöreskog's 1970 procedure for analysis of covariance structures to a model for determining individual differences in multidimensional scaling suggests that Jöreskog's method is more rapid than J. D. Carroll and J. J. Chang's (see PA, Vol 47:5960) procedure.

4300. **Cattell, R. B.** (Inst for Research on Morality & Adjustment, Boulder, CO) **Radial parcel factoring-vs-item factoring in defining personality structure in questionnaires: Theory and experimental checks.** *Australian Journal of Psychology*, 1974(Aug), Vol 26(2), 103-119.—Allegations have been made that factoring by items is acceptable but by parcels is not. Theoretical reasons are given for expecting that factors should actually be the same in number and nature from items and parcels, and that, moreover, the latter will give more accurately determined unique simple structure resolution. From 184 items found in several researches to cover some 19-20 primary factors, 46 parcels of 4 in each were made by radial parcelling. Factorings using blind rotation, employing both items and parcels on each of 2 groups ( $N = 246$  and  $780$ ) independently, showed close agreement on number of factors and in obtaining significant matching indices for each factor (a) among the 4 solutions and (b) with the ideal criterion pattern. As hypothesized, the advantages in precision of rotation turn out to be with the parcelling method. (37 ref) —*Journal abstract.*

4301. **Cicchetti, Dominic V.** (VA Hosp, West Haven, CT) **Reply to Keselman concerning Cicchetti's interpretation of the findings of Petrionovich and Hardyck.** *Psychological Bulletin*, 1974(Nov), Vol 81(11), 896-897.—H. J. Keselman (see PA, Vol 51:8133) recently challenged a statement made by D. V. Cicchetti in 1972 that the Tukey and Scheffé tests control adequately for Type-I and Type-II errors. The present paper challenges Keselman's reasoning.

4302. **Deniau, C. & Oppenheim, G.** [Two linear methods in multidimensional statistics: II. Analysis of conditional frequency tables.] (Fren) *Mathématique et Sciences Humaines*, 1974, No 45, 5-28.—Analysis of conditional frequency tables is demonstrated on data derived from demographic surveys. Mathematics of euclidean distance and vector profiles are explained. Relationships between the 2 methods are pointed out.

4303. **Deniau, C.; Leroux, G. & Oppenheim, G.** (U René Descartes, Paris, France) [Two linear methods in multidimensional statistics: I. Analysis of principal components.] (Fren) *Mathématique et Sciences Humaines*, 1973, No 44, 5-34.—Demonstrates the principal components in factor analysis on an actual data matrix and discusses its mathematical bases in an algebraic framework. Graphical representation and the quality of cluster projections are considered in detail.

4304. **Ekehammar, Bo & Magnusson, David.** **A method to study stressful situations.** *Reports from the Psychological Laboratories, University of Stockholm*, 1972(Jan), No 343, 7 p.—Similarity ratings of 20 situations on a numerical scale were made by 10 14-15 yr old Ss. Some of the situations were regarded as being stressful for persons in general. A dimensionality

analysis of the mean similarity matrix was performed. The analysis indicated that the Ss separated stressful situations from neutral situations. 2 situational dimensions, interpreted as "ego threat" and "threat of pain," were obtained for stressful situations. A categorization analysis on the similarity matrix confirmed the outcome of the dimensional analysis. (23 ref)—*Journal abstract.*

4305. **Estes, W. K. & Suppes, Patrick.** (Rockefeller U, New York, NY) **Foundations of stimulus sampling theory.** In D. H. Krantz, R. C. Atkinson, R. D. Luce & P. Suppes (Eds), *Contemporary developments in mathematical psychology: I. Learning, memory and thinking*. San Francisco, CA: W. H. Freeman, 1974. xiii, 299 p. \$9.—Details the development of the axiomatic bases of stimulus sampling theory and illustrates the usefulness of the theory by proving the Markov theorem for stimulus sampling models. It is proposed that the application of Markov chains to complex reinforcement schedules whose contingencies extend over several trials will be suggestive of other experiments. (18 ref)

4306. **Fuller, Carol H.** (US Naval Personnel Research & Development Lab, Washington, DC) **Weighting to adjust for survey nonresponse.** *Public Opinion Quarterly*, 1974(Sum), Vol 38(2), 239-246.—Considers the assumptions underlying the use of statistical weighting to adjust for survey nonresponse in judgment and probability samples. Factors such as proportionate sampling, and weighting with and without follow-up procedures are discussed. (22 ref)

4307. **Gross, Alan L.; Faggen-Steckler, Jane & McCarthy, Karen.** (Graduate School & University Ctr, City U New York) **Statistical procedures for evaluating the practical utility of a moderator approach to prediction.** *Journal of Applied Psychology*, 1974(Oct), Vol 59(5), 578-582.—Describes 3 statistical procedures for evaluating the practical utility of a moderator approach. Each procedure gives tests of significance for the comparison of 3 prediction strategies: (a) using the moderator variable as a basis for subgrouping Ss and computing separate regression equations, (b) using the moderator variable as a predictor variable, or (c) excluding the moderator variable from the prediction model. It is concluded that when job performance is measured along a continuum, the average  $y$  score of the selected group (Procedure 1) should be considered. However, when 2 levels of job performance are measured, (e.g., pass-fail grades) then either the number of selection errors (Procedure 2) or the number of selection errors when a selection ratio constraint is present (Procedure 3) should be used.—*Journal abstract.*

4308. **Hubert, Lawrence J.** (U Wisconsin) **Some applications of graph theory to clustering.** *Psychometrika*, 1974(Sep), Vol 39(3), 283-309.—Reviews and expands upon the relationship between graph theory and the clustering of a set of objects. Several graph-theoretic criteria are proposed for use within a general clustering paradigm as a means of developing procedures "in between" the extremes of complete-link and single-link hierarchical partitioning; these same ideas are then extended to include the more general problem of constructing subsets of objects with overlap. A number of related topics are surveyed within the general context of reinterpreting and justifying methods of clustering either through standard concepts in graph theory or their

simple extensions. (4 p ref)—*Journal abstract.*

4309. Kohr, Richard L. & Games, Paul A. **Robustness of the analysis of variance, the Welch procedure and a box procedure to heterogeneous variances.** *Journal of Experimental Education*, 1974(Fall), Vol 43(1), 61-69. —Considers that numerous studies have documented the robustness of  $t$  and  $F$  to heterogeneous variances under the restricted condition of equal  $n$ 's. Likewise, the distortion of  $\alpha$  in the presence of unequal  $n$ 's and variances has been demonstrated in both mathematical and empirical studies. Several investigations, however, have shown the Welch technique to be robust to this situation in the 2 group case. The present study was addressed to the  $k$ -group analysis of variance (ANOVA) situation. Monte Carlo methods were employed to contrast several procedures with respect to control over Type I errors and power. Results indicate that the generalized Welch technique may be substituted for the ANOVA when variances are heterogeneous and  $n$ 's are unequal. (20 ref)—*Journal abstract.*

4310. Levi, A. M. (U Haifa, Israel) **Constructive, extensive measurement of preference to predict choice between sums of outcomes.** *Behavioral Science*, 1974(Sep), Vol 19(5), 326-335. —Examined a decision-making process in 3 studies which scaled preference toward preventing crimes. Study I found a power relationship between extensive measurement (EM), 11 university student respondents, and a magnitude estimation (ME) scale of another study. Study II, using EM, successfully predicted choice ( $p < .01$ ) between sums of 2 outcomes with 10 respondents and then replicated the finding with 1 teacher respondent. Study III scaled 10 adult respondents by EM, ME, and a Thurstonian method. Study I was replicated. EM was differentiated from the other methods; it predicted itself 80-83%, while predicting the others 37-63%. (18 ref)—*Journal abstract.*

4311. Levy, Kenneth J. (State U New York, Buffalo) **Testing that  $K$  independent random samples were drawn from  $K$  normal populations.** *Psychometrika*, 1974(Sep), Vol 39(3), 363. —Suggests a simple extension of R. B. D'Agostino and E. E. Cureton's (see PA, Vol 78:1508) test of normality against skewed alternatives (based upon the 3rd standardized sample moment) to the case of  $k$  independent random samples.

4312. Mandell, Lewis. (U Maine) **When to weight: Determining nonresponse bias in survey data.** *Public Opinion Quarterly*, 1974(Sum), Vol 38(2), 247-252. —Examines criteria that are important in determining how to weight for nonresponse in sample surveys. Mathematical procedures are provided to facilitate weighting procedures.

4313. Overall, John E. & Woodward, J. Arthur. (U Texas, Medical Branch, Galveston) **A simple test for heterogeneity of variance in complex factorial designs.** *Psychometrika*, 1974(Sep), Vol 39(3), 311-318. —Develops a simple procedure for testing heterogeneity of variance which generalizes readily to complex, multifactor experimental designs. Monte Carlo studies indicate that the  $Z$ -variance test statistic presented here yields results equivalent to other familiar tests for heterogeneity of variance in simple 1-way designs where comparisons are feasible. The primary advantage of the  $Z$ -variance test is in the analysis of factorial effects on sample variances in more complex designs. An example involv-

ing a 3-way factorial design is presented.—*Journal abstract.*

4314. Rowse, Glenwood L.; Gustafson, David H. & Ludke, Robert L. (U Wisconsin) **Comparison of roles for aggregating subjective likelihood ratios.** *Organizational Behavior & Human Performance*, 1974(Oct), Vol 12(2), 274-285. —Investigated the goodness of 1 behavioral and 5 mathematical aggregation rules for combining likelihood ratio estimates given by a group of experts (96 firemen). Behavioral aggregation required only that all 4 members of the group agree to use a single estimate. All mathematical aggregation rules used the geometric mean of the estimates. However, 5 methods were used to weight the estimates of each "expert." The methods used were equal weights, peer-assigned weights, self-assigned weights, group-assigned weights (combined peer and self), and an average between self- and group-assigned weights. Statistical differences were found in favor of mathematical consensus for likelihood ratios from size 2 to 15. No differences were found for smaller or larger likelihood ratios, or between the various weighting methods. Equal weighting of experts was the simplest method to use. Estimates were obtained at a rate of 3.25 min/group/estimate.—*Journal abstract.*

4315. Singh, R. P. (Patna U, Faculty of Education, India) **A table for determining sample size from a given population.** *Indian Journal of Psychometry & Education*, 1973(Dec), Vol 4(2), 83-84. —Presents a reference table for determining sample size from a given population using 1960 National Education Association formula based on chi-square with one degree of freedom and population proportion assumed to be .50.

4316. Srivastava, A. B. (National Inst of Administration Health & Education, New Delhi, India) **Advances in multivariate methods, particularly some analogues of univariate tests: Application to educational research.** *Indian Journal of Psychometry & Education*, 1973(Dec), Vol 4(2), 45-53. —Discusses the application to educational research of the multivariate analogues of univariate statistical procedures, including comparison of 2 or more groups on any number of variables, analysis of covariance with multiple covariates, factorial analysis of variance, tests of homogeneity of regression, equality of covariance matrices, and correlations among sets of variables. It is suggested that multivariate procedures are eminently suitable for educational research, and are often the only appropriate ones.—*J. B. Francis.*

4317. Zinnes, Joseph L. & Griggs, Richard A. (Indiana U) **Probabilistic, multidimensional unfolding analysis.** *Psychometrika*, 1974(Sep), Vol 39(3), 327-350. —A probabilistic, multidimensional version of C. H. Coombs's unfolding model is obtained by assuming that the projections of each stimulus and each individual on each axis are normally distributed. Exact equations are developed for the single dimensional case and an approximate one for the multidimensional case. Both types of equations are expressed solely in terms of univariate normal distribution functions and are therefore easy to evaluate. A Monte Carlo experiment, involving 9 stimuli and 3 Ss in a 2-dimensional space, was run to determine the degree of accuracy of the multidimensional equation and the feasibility of using iterative methods to obtain maximum likelihood estimates of the stimulus and S coordinates. Results

reported here are gratifying in both respects. (25 ref)  
—*Journal abstract.*

## PERCEPTION AND MOTOR PERFORMANCE

### Perceptual Processes

4318. Bliss, James C. (Telesensory Systems, Palo Alto, CA) **Summary of three optacon-related cutaneous experiments.** In *Conference on cutaneous communication systems and devices*. Austin, TX: Psychonomic Society, 1974. vi, 122 p.—Describes 3 experiments to evaluate 2-point discriminations, perception of alphabetic patterns, and tactile reading with the Optacon, a direct translation tactile reading system for the blind. Data indicate that spatial patterns formed on an array of vibratory stimulators were sensed within the limits of internal intensity and spatial noise sources. Cognitive mechanisms which also operate during scanning are described.

4319. Bornstein, Marc H. (Yale U) **Perceptual generalization: A note on the peak shift.** *Psychological Bulletin*, 1974(Nov), Vol 81(11), 804-808.—Contents that a recent review of the literature on peak shift by R. B. Purtle (see PA, Vol 51:8409) fails to attend to the influence of underlying perceptual categories. The argument for such an influence (e.g., in wavelength generalization) is presented, and examples from several animal species are reported. (33 ref)—*Journal abstract.*

4320. Craig, James C. (Indiana U) **Pictorial and abstract cutaneous displays.** In *Conference on cutaneous communication systems and devices*. Austin, TX: Psychonomic Society, 1974. vi, 122 p.—Describes the Kinotact, an apparatus which converts optical images to a pattern of vibration transmitted to an O's skin, and reports an experiment to compare O's ability to identify block letters of the alphabet under pictorial (when the pictorial quality of the optical image was preserved) and abstract (when the pictorial quality was disturbed) conditions. No differences in O's ability to identify the letters, in the rates of acquisition of the letters, or in the confusion matrices generated by the pictorial and abstract conditions were found.

4321. Downs, Florence S. (New York U, Div of Nurse Education) **Bed rest and sensory disturbances.** *American Journal of Nursing*, 1974(Mar), Vol 74(3), 434-438.—Determined the effects of 3 sensory deprivation conditions upon the perceptions and motor behavior of bed rest Ss. The 3 conditions were ambient auditory input of room tone only, decoded auditory input of radio selections, and coded auditory input of 2-, 4-, 6-, and 8-min randomly assigned segments of taped radio selections. The dependent variable reported was the presence of S's indeterminate stimulus experiences (ISEs). Ss were 90 male and 90 female adults 18-25 yrs old, recruited from an urban university, who were randomly assigned to one of the experimental conditions for 2½ hrs of bed rest, remaining awake. Following the bed rest they were interviewed to determine the occurrence of ISEs. Ss in the decoded auditory input condition reported fewer ISEs than those in the coded and ambient conditions. The implications for nursing care of bed rest patients

and patients in recumbent positions are discussed.—R. G. Gibson.

4322. Fried, Peter A. (Carleton U, Ottawa, Ontario, Canada) **Readiness in perception: Principle and practice.** Lexington, MA: D. C. Heath, 1974. xii, 548 p.—Presents a collection of 52 empirical and discussion papers on different theoretical approaches to the question of relating perceptual input to output, perceptual learning and the underlying physiological mechanisms, and higher perceptual processes (e.g., attentional mechanisms, memory, and individual differences in perception).

4323. Fucci, Donald J.; Arnst, Dennis & Telage, Kal M. (Ohio U) **The effects of pulsed and continuous stimulation on vibrotactile thresholds obtained from the tongue.** *Psychonomic Science*, 1972(Oct), Vol 29(2), 83-84.—Obtained vibrotactile thresholds from the anterior midline surface of the tongue on 2 groups of 52 normal-speaking 18-36 yr old adults by using ascending-pulsed, ascending-continuous, and descending-continuous stimulation. The *t*-test comparisons of the data showed no significant differences between ascending-pulsed and continuous thresholds; however, significant *t* tests were obtained when comparing ascending-continuous and descending-continuous data. Results suggest that descending-continuous vibrotactile thresholds are significantly poorer than either ascending-pulsed or continuous thresholds.—*Journal abstract.*

4324. Gescheider, George A. (Hamilton Coll) **Temporal relations in cutaneous stimulation.** In *Conference on cutaneous communication systems and devices*. Austin, TX: Psychonomic Society, 1974. vi, 122 p.—Discusses cutaneous information processing in 3 situations: (a) when successive stimuli are separated by short time intervals so that a single sensation is perceived, (b) when time intervals between stimuli are long enough to just barely be perceived as successive, and (c) when the time intervals are long enough to reliably result in correct judgments of temporal order. The role of neural inhibitory systems in determining temporal sensitivity, and a cutaneous model of auditory sound localization are also examined. (20 ref)

4325. Gilson, Richard D. (Ohio State U) **Vibratory masking.** In *Conference on cutaneous communication systems and devices*. Austin, TX: Psychonomic Society, 1974. vi, 122 p.—Discusses methodological issues in masking techniques and evaluation procedures (forced choice techniques and method of limits). These techniques are related to G. Békésy's description of funneling (1967), and the relative applicability of each technique to 2 purposes of masking—investigating neural interactions or studying the discriminability between various elements in a multiple pattern—is examined.

4326. Griffiths, Ian & McIntyre, Donald. (Electricity Council Research Ctr, Chester, England) **Subjective response to overhead thermal radiation.** *Human Factors*, 1974(Aug), Vol 16(4), 415-422.—8 bald and 36 nonbald male technicians and scientists in 2 experiments experienced conditions in which ceiling temperatures varied between 26.5 and 45°C. Air temperature, mean radiant temperature, air velocity, and humidity were held constant. Experimental variables consisted of 2 levels of seat height, S baldness, and environmental temperature.

Ss appraised the environmental conditions by use of a 34-item semantic differential questionnaire. Baldness and seat height were unimportant factors, but ceiling temperature significantly affected warmth assessment. Conditions of higher ceiling temperature were perceived as cooler than those with the same mean radiant temperature and lower ceiling temperatures. Results indicate that (a) there was greater sensitivity to radiant exchange with walls than with the ceiling and (b) European upper limits for ceiling temperature are unduly restrictive.—*Journal abstract.*

4327. Hahn, John F. (U Virginia) **Vibratory adaptation.** In *Conference on cutaneous communication systems and devices*. Austin, TX: Psychonomic Society, 1974. vi, 122 p.—Reviews some recent human psychophysical data on vibratory adaptation and findings from electrophysiological recording of single nerve cells. Variations in the amplitude of the vibrotactile stimulus and its differential effects on subjective and absolute thresholds, the function of receptors, and the need for further research on vibratory adaptation are discussed.

4328. Hill, John W. (Stanford Research Inst, Menlo Park, CA) **Limited field of view in reading lettershapes with the fingers.** In *Conference on cutaneous communication systems and devices*. Austin, TX: Psychonomic Society, 1974. vi, 122 p.—Reports a series of experiments on the effects on reading rate and ability of expanded field of view presentations on a computerized tactile text-presentation system. Data from 6 different display formats show that only a limited area of the fingers was used in tactile reading and that there was a high degree of transfer of learned ability between different display formats for experienced Ss.

4329. Keidel, Wolf D. (Erlangen U, Physiological Inst, W Germany) **The cochlear model in skin stimulation.** In *Conference on cutaneous communication systems and devices*. Austin, TX: Psychonomic Society, 1974. vi, 122 p.—Describes the use of G. Békésy's 1961 model for information transfer to the skin of the human forearm and modification of the model into a system of on-line computer simulation of an electronic dispersion model of cochlear perception. The work of P. Finkenzerler in expanding the spatial and temporal pattern distributions of the Békésy model is also examined.

4330. Lechelt, Eugene C. (U Alberta, Edmonton, Canada) **Some stimulus parameters of tactile numerosness perception.** In *Conference on cutaneous communication systems and devices*. Austin, TX: Psychonomic Society, 1974. vi, 122 p.—Studied the effects of stimulus presentation rate and number, spatio-temporal patterning, signal intensity, and irregular presentation rates on subjective impressions of the number of stimuli in trains of successive tactile pulses. Results indicate that if reliable transmission of tactile signal information is to be achieved, signals should be of high intensity, presented at slow and constant rates, and distributed spatially among several loci instead of confined to a single placement. (43 ref)

4331. O'Rand, Angela & Ellis, Robert A. (Florida Atlantic U) **Social class and social time perspective.** *Social Forces*, 1974(Sep), Vol 53(1), 53-62.—Describes a methodological procedure (the Social Time Perspective Scale) for determining class-linked differences in the way

persons anticipate the future and orient their behavior to it. Data were drawn from 80 male undergraduates from middle-class backgrounds and from 80 Job Corpsmen primarily from lower-class backgrounds. Findings reveal that: (a) lower-class youth in the Job Corps have a more circumscribed notion of future time than youth from the middle class and their outlook on the future is less systematically ordered; (b) upwardly mobile lower-class youth in college have succeeded in incorporating some features of the middle-class pattern of future orientation in their temporal outlook, but residues of their lower-class backgrounds are still present; and (c) in both the lower- and middle-class samples, the length of temporal perspectives is a factor mediating effective role performance. (42 ref)—*Journal abstract.*

4332. Orme, J. E. (Sheffield Area Psychological Service, England) **Precondition and time.** *Journal of the Society for Psychical Research*, 1974(Jun), Vol 47(760), 351-365.—Devises a theoretical framework to account for precognition and other paranormal experiences (e.g., telepathy and clairvoyance). The characteristics of precognitive experiences are discussed: the conditions in which they occur, their information value, their temporal properties, and associated factors of personality and psychopathology. The dream is the most common vehicle for precognitive experiences. Relaxed and passive people are the most prone to have such experiences. Relatively unimportant events are foreseen as frequently as deaths and accidents and the events tend to be in the near rather than the distant future. An hypothesis that time possesses extensive properties is developed.—G. J. Frankel.

4333. Parker, Adrian. (U Edinburgh, Scotland) **Some success at screening for high scoring ESP subjects.** *Journal of the Society for Psychical Research*, 1974(Jun), Vol 47(760), 366-370.—Reports 2 cases of extended ESP success from a sample of 25 volunteers screened on the Edinburgh Electronic ESP Tester (EET). The EET is a randomizer which selects 1 of 5 lamps to be subsequently illuminated on a display panel. The S has a similar display panel on which he presses the button that he thinks corresponds to the lamp illuminated on the agent's panel. A controlled card-guessing series followed the screening. The successful card-guessing results pose a fundamental problem in parapsychology: Why were 2 high-scoring subjects found in a sample of 25? The possible influence of such factors as expectancy, rapport, and changes in subjective state in producing high ESP scores is considered.—G. J. Frankel.

4334. Sherrick, Carl E. (Princeton U) **Current prospects for cutaneous communication.** In *Conference on cutaneous communication systems and devices*. Austin, TX: Psychonomic Society, 1974. vi, 122 p.—Discusses the state of research on cutaneous communication including the areas of figure-ground relations in tactile displays, contour generation, and the acquisition of tactile skills. Technical and methodological developments in these areas are considered, and the need for further investigation of cutaneous perception, processing, and training is examined. (19 ref)

4335. Stevens, Joseph C. (Yale U) **Psychophysical invariances in proprioception.** In *Conference on cutaneous communication systems and devices*. Austin, TX:

Psychonomic Society, 1974. vi, 122 p.—Reviews experiments which attempted to establish exact quantitative relations between the degree of perceived effort and the level and duration of exertion. Data from a finger-squeeze experiment and a study of apparent effort as a function of muscle group suggest that apparent effort grows in proportion to the force level raised to the 1.7 power and that this exponent varies only slightly as a function of the psychophysical method used.

4336. Verrillo, Ronald T. (Syracuse U) **Vibrotactile intensity scaling at several body sites.** In *Conference on cutaneous communication systems and devices*. Austin, TX: Psychonomic Society, 1974. vi, 122 p.—A review of the background and recent research on the growth of subjective magnitude over different parts of the body indicates that this function changes when the site of stimulation is shifted from one location to another and that it does so in an orderly manner. The relationship between this perception of vibratory stimulus magnitude and the basic problem of how intensity is coded in the nervous system is also examined.

4337. Walker, James T. & Shea, Karen S. (U Missouri, St Louis) **A tactual size aftereffect contingent on hand position.** *Journal of Experimental Psychology*, 1974(Oct), Vol 103(4), 668-674.—In 3 experiments with a total of 64 undergraduate Ss, a narrow inspection bar was located on S's left (or right) and a wide bar on the right (or left). During an inspection period of 2 min, S grasped the bars alternately, moving a single hand from one bar to the other. A test bar of intermediate width subsequently presented on the left (or right) then felt wider to the same hand than an intermediate bar presented in the other position. No intermanual transfer occurred; thus, the aftereffect was confined to a single hand. There are many analogies between the present contingent aftereffect in the tactual-kinesthetic modality and a number of contingent aftereffects in the visual modality, such as the McCollough effect. 4338. White, Benjamin W. (California State U, San Francisco) **What other senses can tell us about cutaneous communication.** In *Conference on cutaneous communication systems and devices*. Austin, TX: Psychonomic Society, 1974. vi, 122 p.—Discusses 3 kinds of information (layout, identity, and language) that are gathered by the senses and how various perceptual systems handle each type of information. The prevalence of each sensory system in processing each type of information (e.g., when conflicting information about the environmental layout is received by 2 senses, the visual system will probably prevail) is examined, and data on temporal organization in the tactile modality are discussed. (29 ref)

4339. Wong, T. S.; Ho, R. & Ho, J. (U Waikato, Hamilton, New Zealand) **Influence of shape of receptor organ on the horizontal-vertical illusion in passive touch.** *Journal of Experimental Psychology*, 1974(Sep), Vol 103(3), 414-419.—Conducted 4 experiments involving 156 17-26 yr olds in which stimulus templates were traced onto the volar surface of S's forearm. Exp I showed that rotation of a T figure over 180° resulted in an illusion function, with a reversal of the effect at 90°. A similar function was obtained in Exp II with an L

figure, indicating the absence of a bisection effect. The component line along the shorter lateral axis was judged longer than that aligned with the longitudinal axis of the forearm. Exps III and IV indicated that the effect was independent of the degree of stimulation on the skin and that an inscribed circle was similarly affected and perceived as a lateral ellipse. It is concluded that the horizontal-vertical illusion in passive touch is a function of the orientation of the figure with reference to the elongated frame of the receptor organ and is independent of the effect in vision and active touch. (20 ref) —*Journal abstract*.

### Auditory Preception

4340. Ainsworth, W. A. (U Keele, England) **The influence of precursive sequences on perception of synthesized vowels.** *Language & Speech*, 1974(Apr-Jun), Vol 17(2), 103-109.—Tested the hypothesis that the durations of speech sounds are not perceived absolutely but, rather, relative to the durations of the sounds which precede them. It was found that the classification of vowel sounds is influenced by the rhythm of sounds in a precursive sequence, especially if the duration of these vowels lies in the region between the normal durations of "short" and "long" vowels.

4341. Caramazza, A.; Yeni-Komshian, G. & Zurif, E. B. (Johns Hopkins U) **Bilingual switching: The phonological level.** *Canadian Journal of Psychology*, 1974(Sep), Vol 28(3), 310-318.—Investigated whether J. Macnamara's (1967) 2-switch model of bilingual functioning is applicable to the phonological level. 20 Canadian French-English bilingual high school seniors were tested for their perception and production of the phonological feature of voice onset time. Ss were tested twice, once in a French language set and once in an English language set. The perceptual functions obtained under the 2 language set conditions were virtually identical, whereas the production distributions were significantly different in the 2 conditions. Results suggest that the 2-switch model can be applied to the phonological level. (French summary) —*Journal abstract*.

4342. Fidell, Sanford; Pearsons, Karl S. & Bennett, Ricarda. (Bolt Beranek & Newman, Canoga Park, CA) **Prediction of aural detectability of noise signals.** *Human Factors*, 1974(Aug), Vol 16(4), 373-383.—Conducted 2 series of psychoacoustic tests with a total of 19 college student Os to determine the applicability of the psychophysical theory of signal detectability (TSD) to prediction of the aural detectability of noise signatures in differing noise backgrounds. The 1st series of tests produced data supporting development of a simplified graphical prediction method based on TSD. A 2nd series validated the precision and accuracy of the prediction method under quasi-realistic conditions. Predicted levels of performance were typically within 1 or 2 db of the data. —*Journal abstract*.

4343. Franzén, Ove; Nordmark, Jan & Sjöberg, Lennart. **A study of pitch.** *Göteborg Psychological Reports*, 1972, Vol 2(12), 31 p.—120 experienced psychology students made judgments of 10 sinusoids and pulses in the range 80-5,500 Hz. Judgment tasks were graded paired comparisons, estimation of magnitudes, ratios, similarities, and category membership and ratings. The

judgment continuum was unidimensional with no clear time-order error. Response bias in ratio estimation was similar to results in previous studies. The mel scales were unusually highly negatively accelerated and were similar for sinusoids and pulses. H. Eislser and G. Ekman's (see PA, Vol 34:2509) similarity equation was not supported. (24 ref)—*Journal abstract*.

4344. Fry, D. B. (University Coll London, England) **Right ear advantage for speech presented monaurally.** *Language & Speech*, 1974(Apr-Jun), Vol 17(2), 142-151.

—In a series of choice reaction time experiments, members of minimal pairs of English words were presented monaurally to the right and left ears of 48 right-handed adult Ss who made a keypressing response indicating the word they had heard. The word pairs used were /pit:bit/, /bit:bet/, /lei:rei/, and /splei:sprei/; the stimuli were recorded natural utterances. Mean reaction time showed a highly significant right-ear advantage of 25 msec in the case of the word pair /splei:sprei/, a significant right-ear advantage of 15 msec for /lei:rei/, and no significant difference between the ears for /pit:bit/ or /bit:bet/. (23 ref)—*Journal abstract*.

4345. Hawkins, Harold L. et al. (U South Florida) **Precategorical selective attention and tonal specificity in auditory recognition.** *Journal of Experimental Psychology*, 1974(Sep), Vol 103(3), 530-538.—Conducted 2

auditory recognition masking experiments to test D. E. Broadbent (1958) and A. M. Treisman's (1964) hypothesis that a mechanism of selective attention is located prior to the point of contact between acoustic input and memory (i.e., prior to stimulus categorization). Graduate and undergraduate psychology students ( $N = 12$ ), were tested under 3 conditions of test-tone-masker laterality: monaural masker presented ipsilateral to test tone, monaural masker presented contralateral to test tone, and binaural masker. In Exp I, where masker frequency was unpredictable, masking effects occurred under all laterality conditions. However, in Exp II, where masker frequency was predictable, masking effects appeared under ipsilateral but not contralateral or binaural conditions. These findings imply (a) the existence of a mechanism of selective attention located prior to the categorization of acoustic input, (b) that this mechanism operates subsequent to the fusion of binaurally presented information, and (c) that its effectiveness is contingent upon prespecification of the frequency characteristics of the input to be inhibited.—*Journal abstract*.

4346. Hedden, Steven K. (U Iowa) **Preferences for single tone stimuli.** *Journal of Research in Music Education*, 1974(Sum), Vol 22(2), 136-142.—Asked 30 music and 30 nonmusic majors at a university to rate relative liking for tones of differing complexity (pure tone, square-wave tone, complex tone), 2 levels of intensity (10 db, 30 db), and 3 frequencies (100 Hz, 350 Hz, 700 Hz). For music majors wave form was the major factor, pure tones being most preferred, but intensity and the interaction between intensity and wave form were also significant. Nonmusic majors preferred the softer of 2 levels, and the main effect for wave form was significant, as were interactions of wave form with intensity and frequency with intensity.—D. S. Higbee.

4347. Latorre, Ronald. (McGill U, Montreal, Quebec, Canada) **The directional effect of intensity change on**

**estimative differences in loudness.** *Australian Journal of Psychology*, 1974(Aug), Vol 26(2), 93-98.—Tested the hypothesis that there would be a greater perceived difference in intensity of 2 tones presented in an increasing order of intensity than the same tones presented in a decreasing order. In Exp I 41 undergraduates indicated which of a 2-tone set, in successive 3-tone trials, contained the greater intensity difference. In Exp II 18 Ss numerically estimated the intensity difference of 2 tones presented in both orders of intensity change. Results of both experiments support the hypothesis and are discussed in reference to orientation-response research.—*Journal abstract*.

4348. Lidén, G. et al. (U Göteborg, Sweden) **The stapedius reflex and motor reaction time: A parallel investigation of the effects of drugs.** *Scandinavian Audiology*, 1974, Vol 3(2), 73-80.—Studied the effect of pentymal, diazepam, and placebo on motor reaction time (RT), threshold latency, and rise time of the stapedius reflex in 18 normal hearing 18-31 yr old Ss. The effects of the soporific and tranquilizer were compared with the normal values for RT, threshold, latency, and rise time based on 2,160 measurements. In all of 10 different conditions pentymal caused significantly longer RTs, and in 9 of 10 conditions diazepam gave a similar effect. Placebo resulted in prolonged RT in 5 of 10 conditions. No significant effect could be demonstrated on the stapedius reflex. In Part 2 of the investigation the group difference between the measurements before and after drug ingestion was examined at every test session. Statistical tests revealed that in only 5 of 10 different conditions did pentymal give significant, prolonged RT. Diazepam gave corresponding results in only 4 of 10 conditions and placebo did not change RT. The stapedius reflex was not influenced. It is concluded that both pentymal and diazepam impair motor performance in some individuals and that the effect is variable and not obviously predictable. The stapedius reflex measure, however, appears insufficiently sensitive to evaluate the effects of these drugs in humans.—*Journal abstract*.

4349. Raslear, Thomas G. (Brown U, Hunter Lab of Psychology) **The use of the cochlear microphonic response as an indicant of auditory sensitivity: Review and evaluation.** *Psychological Bulletin*, 1974(Nov), Vol 81(11), 791-803.—The validity of the use of the cochlear microphonic (CM) isopotential function as an index of auditory sensitivity was assessed by (a) examining the characteristics of CM recordings to determine if there were any sources of bias inherent in the technique that might influence its representation of sensitivity, (b) qualitatively comparing the shapes of CM and behavioral "audiograms" of 16 animal species obtained in previous studies, and (c) making a quantitative estimate and statistical evaluation of the correspondence between the 16 pairs of audiograms. Potential high frequency bias was found in the CM recording technique, which would be expected to reduce the correspondence between CM isopotential functions and behavioral audiograms. Examination of the 16 pairs of audiograms showed that on the average, the use of a linear rule to predict behavioral audiograms from CM isopotential functions could account for more than 40% of the variance in the behavioral data. The lack of a well-defined region of

maximum sensitivity in the CM audiograms was the most consistent shape discrepancy between the 2 data sets. Moreover, the CM audiogram was only an indicator of relative, not absolute, sensitivity. Several possibilities for improving the correspondence between behavioral and CM audiograms are suggested. (58 ref)—*Journal abstract*.

4350. Richards, Alan M. & Dunn, Jan. (Herbert H. Lehman Coll, City U New York) **Threshold measurement procedures in brief-tone audiometry.** *Journal of Speech & Hearing Research*, 1974(Sep), Vol 17(3), 446-454.—2 methods for determining brief-tone audiometric thresholds were investigated to assess the test-retest reliability and variability of each method. Results indicate that both methods (Bekesy-type tracking with either 1 or 2 db/sec attenuation rates or the method of adjustment) yielded equivalent thresholds, variability, and reliability data. However, practical considerations dictated that the 2 db/sec rate was best suited for future clinical application. Individual temporal integration functions for 20 normal-hearing college students are presented and discussed in relation to their variability and to functions produced by hearing-impaired listeners. (21 ref)—*Journal abstract*.

4351. Rindner, Richard J. (State University Coll New York, New Paltz) **Mechanism of input selection in selective perceptual processing of the accepted message in a dichotic auditory presentation.** *Journal of Experimental Psychology*, 1974(Oct), Vol 103(4), 805-807.—Conducted an experiment on selective auditory perception in which 62 naive undergraduates had to shadow either a familiar or an unfamiliar passage presented dichotically and tap to tones randomly embedded within that passage. The group shadowing the familiar passage performed better on both tasks than the group shadowing the unfamiliar passage. Evidence is presented for interpreting these results as due to a perceptual deficit. A time-sharing schema is presented for explaining the results.—*Journal abstract*.

4352. Sharf, Donald J. & Beiter, Robert C. (U Michigan) **Identification of consonants from formant transitions presented forward and backward.** *Language & Speech*, 1974(Apr-Jun), Vol 17(2), 110-118.—From results of a study of the effect of coarticulation on perception it is concluded that vowel-consonant (VC) transitions were more sufficient cues than CV transitions and that listeners derived more information from transitions when they were preconsontantal than when they were postconsontantal.

4353. Sonn, Martin & Rizy, Edward F. **The effect of display format on sonar detection and localization.** *Human Factors*, 1974(Aug), Vol 16(4), 368-372.—Operator detection-and-localization (DAL) performance was compared for nonrefreshed B-scan and Plan-Position Indicator (PPI) sonar displays under multiple successive transmission conditions. 4 male technicians with good vision were tested in the Raytheon Sonar Control Room Simulation Facility under low red ambient illumination. Simulated sonar targets masked in flat Gaussian noise were presented at various ranges, bearings, and signal-to-noise ratios. Ss were required to detect and localize the targets and to rate their confidence in the DAL. Performance using the B-scan was consistently 2-3 db

better than performance with the PPI. Detectability for both displays increased by about 3 db from the 1st to the 6th "ping."—*Journal abstract*.

4354. Treisman, Anne; Squire, Rosemary & Green, Joanne. (Oxford U, England) **Semantic processing in dichotic listening? A replication.** *Memory & Cognition*, 1974(Oct), Vol 2(4), 641-646.—Explored semantic processing of 1 message while another was attended to and shadowed by 12 Ss in a clarification and replication of J. L. Lewis's (1970) findings. As in Lewis's study, it was found that mean shadowing latency was increased when a synonym of the shadowed word coincided with it on the unattended channel. However, this occurred only with synonyms in an early list position and appeared to affect only a small proportion of trials. The implications of this and other recent findings for theories of selective listening are discussed.—*Journal abstract*.

### Visual Perception

4355. Aiken, Leona S.; Fenker, Richard M. & Evans, Selby H. (Temple U) **Class structure in the biasing of perceived pattern similarity.** *Journal of Experimental Psychology*, 1974(Sep), Vol 103(3), 489-501.—Current judgment models underlying multidimensional scaling assume that perceived interstimulus proximity is determined solely by intradimensional differences between stimuli, independent of context effects. Class structure represents a context effect, with class centroids constituting multidimensional anchors within a configuration. The dependence of proximity judgments on class structure was examined in 3 experiments to test the appropriateness of the multidimensional scaling (MDS) judgment model for configurations containing element clusters. A total of 76 undergraduates served as Ss. Stimuli were multidimensional patterns generated to form 2 classes. Feature usage in judgments of intraclass similarity differed markedly from that in interclass similarity judgments. Moreover, the perceived similarities of 90 between-class pairs were in part determined by the distances of the pair members from class centroids, as well as by intradimensional differences. The partial context dependence of subjective proximity estimates suggests a source of incompleteness of the current MDS judgment model as applied to class structured events. (24 ref)—*Journal abstract*.

4356. Attneave, Fred. (U Oregon) **Apparent movement and the what-where connection.** *Psychologia: An International Journal of Psychology in the Orient*, 1974(Jun), Vol 17(2), 108-120.—Suggests that the systems for object identification and spatial localization must be closely interconnected, although possibly using different brain areas. Object identity is related to apparent movement when 1 shape changes into another. It is important to know when the apparent movement occurs. A conceptual schema is presented which proposes that "what-structure" is elaborated and strengthened as stimulus duration is increased. Apparent movement of several objects at once poses extraordinary theoretical problems. Apparent movement calls into operation one aspect of the brain's ability to keep track of where things are.—*R. D. Nance*.

4357. Brown, D. R.; Schmidt, M. J.; Cosgrove, M. P. & Zuber, J. J. (Purdue U) **Stabilized images: Further**

evidence for central pattern processing. *Psychonomic Science*, 1972(Oct), Vol 29(2), 106-108.—Combined selective adaptation conditions with stabilized retinal images in a test of the hypothesis that whole pattern fading of images reflects the operation of suprarretinal pattern processing units. Ss were 1 24-yr-old and 1 25-yr-old male. Pattern preadaptation was shown to enhance or suppress complete image fading when compared to light adaptation. The effects were demonstrated both when a single eye was adapted and tested and when one eye was adapted and the other was tested. This was taken as strong support for the notion that whole fades reflect pattern processing beyond the retina.—*Journal abstract*.

4358. Erlebacher, Albert & Sekuler, Robert. (Northwestern U) **Perceived length depends on exposure duration: Straight lines and Müller-Lyer stimuli.** *Journal of Experimental Psychology*, 1974(Oct), Vol 103(4), 724-728.—In 2 experiments with a total of 53 undergraduates, brief exposure reduced the apparent length of a straight line. Thereafter, apparent length increased linearly with log exposure duration. The perceived length of 2 parts of the Müller-Lyer illusion was also measured. The apparent length of the tails-inward Müller-Lyer figure increased with duration; the apparent length of the tails-outward figure was unaffected by duration. This is further evidence that the Müller-Lyer illusion consists of 2 functionally different component illusions.—*Journal abstract*.

4359. Finlay, David. (U Newcastle, NSW, Australia) **Spatio-temporal interaction and brightness judgments.** *Australian Journal of Psychology*, 1974(Aug), Vol 26(2), 99-102.—Used the method of magnitude estimation with 4 paid, normally seeing Ss to determine the brightness of areas presented adjacent to a doubly stimulated overlap region. 2 variables were examined, the stimulus-onset-asynchrony (SOA) between the 2 stimuli forming the doubly stimulated region, and the luminance of these stimuli. Where a decrease in luminance summation was expected in this overlap region the adjacent flank increased in brightness with increasing SOA.—*Journal abstract*.

4360. Gill, Kathleen M. & McKeever, Walter F. (Bowling Green State U) **Word length and exposure time effects on the recognition of bilaterally presented words.** *Bulletin of the Psychonomic Society*, 1974(Sep), Vol 4(3), 173-175.—Word length (2, 3, 4, and 5 letters) and exposure time (25, 50, and 100 msec) effects on visual half-field recognition performances were studied in a bilateral word presentation paradigm with 144 right-handed undergraduates. Significant right-field recognition superiority (RFRS) obtained for all length-exposure time conditions except that for 2-letter words exposed for 100 msec. RFRS was significantly greater for each of the 100 msec word lengths than for the 2 shorter lengths and 2 longer word exposures than for the 50- or 100-msec exposures. The magnitude of RFRS was substantially correlated with a "perceptual difficulty" measure (the ratio of the number of milliseconds available for viewing to the number of letters to be viewed). Results are compatible with a hemispheric asymmetry hypothesis and a differential half-fields masking susceptibility mechanism.—*Journal abstract*.

4361. Griggs, Richard. (U Florida) **Constancy scaling theory and the Mueller-Lyer illusion: More disconfirming evidence.** *Bulletin of the Psychonomic Society*, 1974(Sep), Vol 4(3), 168-170.—Length and width judgments were made for modified Müller-Lyer figures (the center shaft of each of the 2 figures was replaced by a rectangle) by 40 undergraduates. The rectangle with outgoing fins was judged longer and wider than a control rectangle of equal size with no fins, but longer and narrower than the rectangle with ingoing fins. The rectangle with ingoing fins was judged shorter and wider than the control rectangle. Results did not support R. L. Gregory's inappropriate constancy scaling explanation of the Müller-Lyer illusion. (19 ref)—*Journal abstract*.

4362. Gummerman, Kent; Hill, George A. & Chastain, Garvin. (U Texas, Austin) **The unimportance of figural characteristics of visual noise masks.** *Journal of Experimental Psychology*, 1974(Oct), Vol 103(4), 820-822.—It has been proposed that the ability of a visual noise mask to stop processing of a target stimulus under backward-masking conditions be gauged by its ability to obscure the target when both stimuli are viewed simultaneously. To assess the usefulness of this proposal, 3 noise masks which varied greatly in effectiveness under conditions of simultaneity were also used as backward masks with 30 female undergraduate Ss. The resulting backward-masking functions were identical for all masks, indicating that the suggestion was not practical for the conditions of this experiment. The findings are interpreted as favoring a process-stopping theory of masking over an integration theory.—*Journal abstract*.

4363. Harcum, E. Rae & Shaw, Mary R. (Coll of William & Mary) **Cognitive and sensory lateral masking of tachistoscopic patterns.** *Journal of Experimental Psychology*, 1974(Oct), Vol 103(4), 663-667.—Investigated detrimental perceptual effects of adding extraneous stimuli to a tachistoscopic pattern. In 2 experiments with a total of 40 adult students with normal vision, a general inhibitory effect on reproduction accuracy was found, along with a local effect on elements spatially close to the extraneous stimuli. This lateral masking was reduced by addition of stimuli that aided in differentiation of target from extrinsic stimuli. Simple reference lines were more effective in this than black rectangles that covered a larger retinal area. Therefore, cognitive masking due to confusion of relevant and extraneous stimuli was more effective than sensory masking by a larger stimulus. The former is attributed to interference in reading out iconic information and the latter to degradation of the icon.—*Journal abstract*.

4364. Hershberger, Wayne A. & Starzec, James J. (Northern Illinois U) **Motion-parallax cues in one-dimensional polar and parallel projections: Differential velocity and acceleration/displacement change.** *Journal of Experimental Psychology*, 1974(Oct), Vol 103(4), 717-723.—24 undergraduate Ss viewed what appeared to be a rigid dotted line rotating in depth about its center and judged the direction of apparent rotation. Differential retinal velocities for corresponding dots on opposite ends of the line were effected by hinging the dotted line at its center and rotating the 2 ends (near and far) through different-sized sectors. 3 matched pairs of motion projections, 1 polar and 1 parallel, were generat-

ed, in which the projected (retinal) velocity of dots on the near end of the line was either less than, equal to, or greater than that of corresponding far dots. This differential velocity proved to be an equally effective mimic of motion parallax (and mediator of perceived orientation in depth) when presented in the context of either type of projection. Further, the polar projection alone incorporated an additional cue to orientation in depth mediating veridical perception of rotation direction.—*Journal abstract.*

4365. Holzworth, R. James & Doherty, Michael E. (Bowling Green State U) **Visual masking by light offset: An experiment in reply to Hogben and DiLollo.** *Journal of Experimental Psychology*, 1974(Oct), Vol 103(4), 815-816.—In an experiment with 6 normally seeing undergraduates, a lighted background field was shut off (MS) at varying intervals either before, during, or after presentation of a grapheme (TS). A forced-choice procedure was used. A performance decrement was observed when MS occurred at TS onset, as well as during and immediately after TS. J. Hogben and V. DiLollo's (see PA, Vol 49:8292) contention that light onset is responsible for masking in this paradigm is discussed.—*Journal abstract.*

4366. Kennedy, John M. (Harvard U) **Perceived lines are not always the sums of their contours.** *Journal of Structural Learning*, 1972, Vol 3(4), 7-10.—Describes a line as a thin deposit of pigment which has 2 boundaries called contours. The 2 contours may have different shapes, and an object depicted by the shape of the line may not be depicted by either contour alone. Perceivers may detect the structure of the line figure without recognizing structures formed by the contours that border and make up the line figure. An illustration is provided by glove and mitten figures, examples of a type of figure which emphasizes the contrast between line structure and contour structure.—*R. S. Albin.*

4367. Kinney, Jo Ann S. & McKay, Christine L. **The visual evoked cortical potential as a measure of stress in naval environments: III. The response to pattern and color.** *US Naval Submarine Medical Research Laboratory Report*, 1974(Mar), No 778, 19 p.—Previous research has shown that it is possible to isolate a response to pattern from the visual evoked cortical potential. This study investigated the optimum conditions for yielding a pattern response and then applied the pattern response to a test of color vision in a total of 24 color-normal, 8 protanope, 1 tritanope, and 8 deutanope Ss. Results show that Ss with normal color vision gave a response to pattern when the pattern was formed of either hue or luminance differences. Color defective Ss responded only to luminance differences and not to hue differences that they could not discriminate. The technique thus can be used as an objective measure of color vision. (22 ref)—*Journal abstract.*

4368. Kinney, Jo Ann S. & Miller, James W. **Judgments of the visibility of colors made from an underwater habitat.** *US Naval Submarine Medical Research Laboratory Report*, 1974(Mar), No 777, 12 p.—Aquanauts made judgments of the relative visibility of colors during the "La Chalupa" dive from the habitat located in 100 ft of Caribbean water. Judgments made with colored targets viewed against the water back-

ground were in agreement with previous studies: bright colors were the easiest to see and dark colors disappeared the most readily. However, when the colors were viewed against a light gray background, dark colors were the most visible. It appears that negative contrast under water is superior to positive contrast of the same amount. Small diurnal changes were found, with green increasing in visibility and orange decreasing as the day wore on.—*Journal abstract.*

4369. Klatzky, Roberta L. & Stoy, Ann M. (U California, Santa Barbara) **Using visual codes for comparisons of pictures.** *Memory & Cognition*, 1974(Oct), Vol 2(4), 727-736.—In 2 experiments, a total of 16 university students indicated for a series of trials whether or not 2 pictures of common objects had the same name. The pictures were separated by 1 of 3 interstimulus intervals (ISIs), and reaction time (RT) was recorded. In Exp I positive trials involved pictures that were identical, mirror images, or physically different but had the same name. The stimuli came from either an S set, in which name-match pairs were physically similar, or a D set, in which name-match pairs were physically dissimilar. The mean RTs for mirror and identity matches were virtually the same but faster than name-match RTs, an advantage that decreased with increasing ISI. It was expected that name-match RT for the S set would be less than for the D set, indicating a facilitative effect of physical similarity; however, the identity-match RTs showed the expected difference. Results were extended in Exp II, which involved only the identity and name matches, in pure sessions (which included positive trials of just 1 type) or mixed sessions (which included both types of positive trials). For mixed sessions, name- as well as identity-match RTs differed between the S and D sets. (32 ref)—*Journal abstract.*

4370. Lichtenstein, Jacob H. & Saucer, Rayford T. (NASA Langley Research Ctr, Hampton, VA) **Visual dependency in the erect and supine positions.** *Journal of Applied Psychology*, 1974(Aug), Vol 59(4), 529-531.—Examined the field dependency-independency of 37 Ss under supine and erect body position. Females were more field dependent than males. No significant differences were found between male pilots and nonpilots. Males exhibited greater field dependency in the supine position. Results suggest the need to consider 3 separate measures of field dependency—slope, breakpoint, and variability.

4371. Matheny, Adam P. (U Louisville, Health Sciences Ctr, Child Development Unit) **Cognitive factors associated with the Ponzo illusion: A study using the co-twin method.** *Psychonomic Science*, 1972(Oct), Vol 29(2), 91-93.—13 male and 21 female pairs of 9-11 yr old monozygotic twins who were discordant on the magnitude of their susceptibility to the Ponzo illusion were studied for differences on WISC subtests. The purpose was to test R. H. Pollack's 1969 hypothesis that children more susceptible to the illusion would perform better on tasks involving numerical sequencing and analogical reasoning. The hypothesis was confirmed for females in that the female twins who had higher magnitudes of the illusion had significantly higher scores on WISC Digit Span and Similarities subtests than did their co-twins.

Male twins showed no differences. (15 ref)—*Journal abstract*.

4372. McIntyre, Curtis W. & Pick, Herbert L. (U Virginia) **Transfer of adaptation to rotation of the visual field.** *Journal of Experimental Psychology*, 1974(Oct), Vol 103(4), 782-791.—Conducted 5 experiments on the adaptation to rotation of the visual field of a total of 352 undergraduate Ss. All were similar in that they restricted movement during exposure to the visual rotation to one direction and subsequently tested for adaptation with movements in other directions. Positive transfer of adaptation to the new directions was found in all experiments. The amount of adaptation varied in a curvilinear pattern as a function of the difference between the exposure direction and the new directions. Moreover, this curvilinear pattern reflected the predominant contribution of a motor or proprioceptive component to visual-motor adaptation. The implications of these results for integrated perceptual-motor coordination systems are discussed.—*Journal abstract*.

4373. Milner, Peter M. (McGill U, Montreal, Quebec, Canada) **A model for visual shape recognition.** *Psychological Review*, 1974(Nov), Vol 81(6), 521-535.—Suggests that many examples of stimulus equivalence may be explained by angle and length-ratio feature detectors whose outputs are generalized over the visual field. Problems of interference between a number of figures simultaneously present, and of localizing the figure that is being recognized, require a mechanism of selective attention. This could involve the temporal segregation of signals from different figures as they pass through the recognition circuits. The figure to which attention is directed feeds a signal back to an earlier stage to enhance the corresponding input before the generalization process deprives it of its spatial information. (22 ref)—*Journal abstract*.

4374. Newman, Colin V. (U Birmingham, England) **Detection of differences between visual textures with varying number of dots.** *Bulletin of the Psychonomic Society*, 1974(Sep), Vol 4(3), 201-202.—Tested 64 undergraduates with normal vision on a judgmental task involving discrimination between textures with variable numbers of elements. Results show that the threshold for detecting percentage differences in numbers of dots in adjacent patterns decreased monotonically with the total number of dots in the standard. Implications of this finding for the perceptual processing of textures are discussed.—*Journal abstract*.

4375. Peterson, M. J. & Graham, S. E. (Indiana U) **Visual detection and visual imagery.** *Journal of Experimental Psychology*, 1974(Sep), Vol 103(3), 509-514.—Suggests that if visual perception and visual imagery involve similar mechanisms, then instructing Ss to imagine scenes compatible with a visual signal should facilitate detection of the signal, while instructing Ss to imagine scenes incompatible with the visual signal should hinder detection of the signal. S. J. Segal's (1971) assimilative theory of imagery predicts superior detection when the image and the external target signal differ; hence, this theory expects more accurate detection of the signal when the images are incompatible than when they are compatible with the signal. 60 undergraduate Ss performed a visual detection task under compatibly cued,

incompatibly cued, and noncued conditions. The imagery group was instructed to imagine the referents of the verbal cues, while the control group simply listened to the cues. The imagery group showed facilitation with compatible cuing and interference with incompatible cuing. The control group also showed facilitation under compatible cuing, but incompatible cuing had no effect.—*Journal abstract*.

4376. Robinson, J. O. (U Coll Cardiff, Wales) **The psychology of visual illusion.** London, England: Hutchinson University Library, 1972. 288 p. \$9.

4377. Roufs, J. A. (Inst voor Perceptie Onderzoek, Eindhoven, Netherlands) **Dynamic properties of vision: VI. Stochastic threshold fluctuations and their effect on flash-to-flicker sensitivity ratio.** *Vision Research*, 1974(Sep), Vol 14(9), 871-888.—Analyzes measurements of psychometric functions at thresholds of single flashes, flash trains, and gated sinusoids obtained from 3 Ss. The stimuli are foveal and have a diameter of 1° and a dark surround. In single flashes the deviation of the probability density function divided by the 50% threshold increment is constant over a background intensity of 5 decades and a flash duration of 3 decades. In flash trains with large flash intervals, the 50% threshold drops as a function of the number of flashes per train due to increase in the chance of detection. Gated sinusoids show the same course as a function of the number of peaks. On the basis of a deterministic model used in preceding parts of this study, the invariance of the Crozier quotient can be resolved into 1 simple stochastic system property. Incorporation into an existing psychophysical model leads to a simple and comprehensive formula for the spread in the 50% thresholds. The threshold course with flash trains and gated sinusoids can be forecast from the stochastic parameters of single flashes. An estimate of the effect on the ratio of flash to flicker sensitivity based on the actual data is in agreement with earlier experimental data. (French, German, & Russian summaries) (25 ref)—*Journal abstract*.

4378. Saenz, Norman E. & Riche, Charles V. (Georgia Inst of Technology) **Shape and color as dimensions of visual redundant code.** *Human Factors*, 1974(Jun), Vol 16(3), 308-313.—Examined the hypothesis that redundant coding is effective in facilitating the locating of a target among other objects. All possible combinations of 4 shapes and 4 colors were used as targets for 24 male undergraduate volunteer Ss. The times to locate 6 each of the targets among 36 background objects for 16 displays in each of 3 coding conditions were determined. The targets could be differentiated from the background objects on the basis of color only, shape only, and redundant color-shape. Results indicate a difference among the coding conditions, the colors, and the shapes, and in the Code  $\times$  Shape and Code  $\times$  Color interactions. An important finding is that the redundant code and the color code conditions did not differ. (15 ref)—*Journal abstract*.

4379. Sivik, Lars. **Color meaning and perceptual color dimensions: A study of exterior colors.** *Göteborg Psychological Reports*, 1974, Vol 4(11), 41 p.—Evaluated 67 different colors, individually considered and photographically simulated as if they were applied to each of 2

different types of buildings. Relationships are presented both in the form of linear correlations and also as isosemantic mapping of the color space. Results obtained were compared, first, as between the 2 types of buildings and second, as between the ratings of exterior colors and ratings of isolated colors. Variables were grouped by means of factor analyses and were further investigated with respect to their results in the color space and the extent to which they varied in different contexts or modes of appearance. A theory is suggested concerning ways in which the connotative patterns derived from the condition of isolated color differ from those derived from other modes of color appearance.—*Journal abstract.*

4380. Stewart, Alan L. & Purcell, Dean G. (New York U, Deafness Research & Training Ctr) **Visual backward masking by a flash of light: A study of U-shaped detection functions.** *Journal of Experimental Psychology*, 1974(Sep), Vol 103(3), 553-566.—Obtained U-shaped backward masking functions, using a homogeneously illuminated field as the masking stimulus. 5 highly trained Ss were given feedback immediately after each stimulus presentation. Each S gave U-shaped masking functions, and performance decrements at intermediate values of temporal separation represented a decrease in sensitivity for some Ss. Both recognition and detection tasks resulted in a family of masking functions. When mask luminance was low relative to target luminance, the functions were U-shaped. As masking luminance increased, the functions became monotonic. Under forward masking, when target and mask energy were equal, S performance was high, although performance decreased monotonically as the onset of the target approached the onset of the mask. Performance then decreased more rapidly until the backward masking U minimum was reached. The result was an asymmetrical masking function about zero stimulus onset asynchrony, with backward masking proving more extensive than forward masking. (24 ref)—*Journal abstract.*

4381. Teichner, Warren H. (New Mexico State U) **The detection of a simple visual signal as a function of time of watch.** *Human Factors*, 1974(Aug), Vol 16(4), 339-353.—Analyses of 37 studies of vigilance showed that the percentage of detection using simple signals depended primarily on the initial or pretest detection level, the nature of the signal (i.e., whether it was a dynamic signal or static), and the duration of the watch. Using the data of these studies, a watchkeeping decremental function was developed. It is shown that the function can be used to estimate a tradeoff between time of watch and the initial percentage of detection. The loss of detection associated with static signals was relatively small. It is suggested that it is this small loss which represents a vigilance process. The greater decrements associated with dynamic stimuli are assumed to be due to an additional ocular demand. (46 ref)—*Journal abstract.*

4382. Uttal, William R. (U Michigan) **A minor perturbing effect of retinal locus on dot pattern recognition: Rejection of a possible artifact.** *Psychonomic Science*, 1972(Oct), Vol 29(2), 100-102.—Conducted an empirical test of the influence of retinal locus in a dot-masking experiment with 7 undergraduates with normal or corrected vision. Results show that the retinal locus

had a minor perturbing effect about one-tenth of the magnitude of the organizational effects under the worst conditions.—*Journal abstract.*

4383. Welch, Robert B.; Choe, Chong Sook & Heinrich, Daniel R. (U Kansas) **Evidence for a three-component model of prism adaptation.** *Journal of Experimental Psychology*, 1974(Oct), Vol 103(4), 700-705.—104 Ss were measured on 42 personality traits and adapted in 2 separate sessions to 11.3° prismatic displacement of the visual field. The prism-adaptive measures were negative aftereffect, proprioceptive shift, and visual shift. None of the personality traits correlated highly with prism adaptability. Furthermore, contrary to the 2-component model of prism adaptation, negative aftereffect exceeded and was not highly correlated with the algebraic sum of the proprioceptive and visual shifts. A secondary finding was that situational cues induced a small adaptive shift (for negative aftereffect and visual shift) in the 2nd session, prior to actual exposure to the prism. It is concluded that prism exposure of the type provided in the present experiment induces a 3rd component that adds to the proprioceptive and visual changes to produce the negative aftereffect. This "new" component is hypothesized to be an assimilated corrective response contingent on error correction during prism exposure. (27 ref)—*Journal abstract.*

4384. Wiener, Earl L. (U Miami) **An adaptive vigilance task with knowledge of results.** *Human Factors*, 1974(Aug), Vol 16(4), 333-338.—Groups of undergraduates performed a 48-min, computer-controlled, visual watch-keeping task. 2 groups of 14 Ss each were run under fixed, nonadaptive conditions, one with immediate knowledge of results (KR) and the other without (NKR). The KR group showed the usual superiority in detection rate over the NKR group and made fewer commissive errors (false alarms). 2 groups of 18 Ss each, also KR and NKR, ran under adaptive conditions wherein the size of the signals they watched for was adjusted during the vigil according to past performance, so as to maintain a preset detection rate. Resulting curves for the adaptive variable closely resemble the traditional performance measure, detection rate. Various adaptive strategies are discussed.—*Journal abstract.*

### Motor Processes & Performance

4385. Amelang, Manfred & Lasogga, Frank. (U Hamburg, Psychological Inst, W Germany) **[Does advance notice about the required reaction affect reaction times?]** (Germ) *Zeitschrift für Experimentelle und Angewandte Psychologie*, 1974, Vol 21(1), 1-24.—Investigated the hypothesis that reaction time (RT) can be reduced by informational signals indicating the required reaction in disjunctive RT experiments. Simple RT and disjunctive RT experiments without information signals served as controls. Results from 11 student Ss were evaluated with analysis of variance. Results show that interstimulus intervals up to .64 sec between informational signal and signal to react did reduce RTs; longer interstimulus intervals had no further improving effect. Disjunctive RTs never reached simple RT values regardless of the length of the interstimulus interval. (English & French summaries)—*W. J. Koppitz.*

4386. Corser, T. (St John's Coll, York, England) **Temporal discrepancies in the electromyographic study of rapid movement.** *Ergonomics*, 1974(May), Vol 17(3), 389-400.—The contention that proper temporal interpretation of rapid movement electromyograms (EMGs) is impossible without prior evaluation of the delays specific to the S and muscles involved was supported by applying such evaluations to explain anomalies in rapid elbow movement EMGs of 11 Ss. It is shown that apparent cocontraction of antagonist muscles may be an artifact explicable by these delay differences. (German summary)

4387. Paulus, Paul B.; Shannon, John C.; Wilson, Dexter L. & Boone, Thomas D. (U Texas, Arlington) **The effect of spectator presence on gymnastic performance in a field situation.** *Psychonomic Science*, 1972(Oct), Vol 29(2), 88-90.—Examined the effect of spectator presence on gymnastic performance in 3 experiments with a total of 64 undergraduates in introductory and advanced gymnastic classes. It was found that spectator presence led to a significant decrement in quality of gymnastic performance when Ss were given a forewarning about the presence of the spectators but had no overall effect when Ss were not forewarned. This finding provides support for the anticipated evaluation modification of R. B. Zajonc's 1965 hypothesis of audience effects. The relationship between the initial level of skill of the Ss and the change in their performance during spectator presence suggests the need for additional modification of Zajonc's position.—*Journal abstract*.

## COGNITIVE PROCESSES AND MOTIVATION

4388. Bart, William M. & Smith, Michael B. (U Minnesota) **An interpretive framework of cognitive structures.** *Human Development*, 1974, Vol 17(3), 161-175.—Provides a precise formulation of both cognitive structure and its related theory, using the mathematical theory of categories. Weaknesses and imprecision in cognitive theory are identified. Using category theory, cognitive structure and related Piagetian theoretic terms are precisely defined and some interrelationships are discussed. Applications to intelligence, learning, and developmental sequence theory are provided. This logico-theoretical framework is an example of the logico-algebraic approach to developmental cognitive psychology, which is intended to produce theoretical integration of concepts and new directions for empirical studies in the cognitive developmental field. (27 ref)—*Journal abstract*.

4389. Bart, William M. (U Minnesota) **An algebraic representation of concepts.** *Journal of Structural Learning*, 1972, Vol 3(4), 27-35.—Attempts to represent algebraically the definition of a concept. This transformational approach is seen as providing an alternative framework for the study of concepts. From this approach, new questions may be asked about the structural properties of the irrelevant transformation sets. Heretofore, this had not been elucidated. It is suggested that these theories will contribute to the development of work on conceptual memory and will be a stimulus to the

determination of other algebraic laws of conception.—R. S. Albin.

4390. Batson, C. Daniel. (Princeton U) **Linguistic analysis and psychological explanations of the mental.** *Journal for the Theory of Social Behavior*, 1972(Apr), Vol 2(1), 37-59.—Discusses linguistic analysis of the way we speak of mental processes and the implications of such analyses for psychological explanations. The discipline of analytic philosophy is briefly described. The issue of consciousness is addressed, i.e., how do we know that other minds exist? The definitions of social traits usually employed are discussed. Motivation in relation to these concepts seems to gloss over important distinctions in the way behavior is explained in ordinary language. (24 ref)—R. S. Albin.

4391. Geller, E. Scott. (Virginia Polytechnic Inst & State U) **Prediction outcome of a response-irrelevant stimulus as a determinant of choice reaction time.** *Journal of Experimental Psychology*, 1974(Sep), Vol 103(3), 546-552.—60 undergraduates predicted the alternatives of separable binary color and shape dimensions; following each 2-dimensional presentation Ss identified only the shape alternative by pulling a right-hand or left-hand trigger. The probability that S correctly predicted the response-irrelevant color alternative was controlled at .50 for 400 trials (20 Ss), was controlled at .50 for an initial 200 trials and then increased to .90 (20 Ss), or decreased to .10 (20 Ss) for 200 trials. Increasing Ss' success at correctly predicting colors diminished the effect of shape probability on choice reaction time (RT). The effects of prediction outcome on RT increased as a direct function of the probability of a correct color prediction. Results imply that Ss' expectancy for a response-relevant stimulus varied concomitantly with Ss' manipulated expectancy for a response-irrelevant stimulus. (20 ref)—*Journal abstract*.

4392. Geller, E. Scott. (Virginia Polytechnic Inst & State U) **Preceding prediction outcome and prediction outcome probability: Interacting determinants of choice reaction time.** *Journal of Experimental Psychology*, 1974(Sep), Vol 103(3), 426-430.—In a 2-choice reaction time (RT) task in which 60 undergraduates made a stimulus prediction prior to each stimulus presentation the probability of a correct stimulus prediction was manipulated between Ss. As the probability of a correct prediction increased, RT to correctly predicted stimuli decreased, while RT to incorrectly predicted stimuli remained unchanged. A significant 2nd-order effect of prediction outcome on RT to correctly predicted stimuli was a decreasing function of the probability of a correct prediction. Results are interpreted within the framework of a continuous expectancy theory.—*Journal abstract*.

4393. Gerwin, Donald. (U Wisconsin, Milwaukee) **Information processing, data inferences, and scientific generalization.** *Behavioral Science*, 1974(Sep), Vol 19(5), 314-325.—Investigated the philosophical view that scientific hypotheses come out of data. 15 faculty members and graduate students were asked to find the function from which a plot of 10 coordinate values affected by random error was derived. Their protocols serve as the basis for an information-processing computer model of performance on the task. The model has a perceptual phase in which a pattern is found in the data, the

selection of a class of hypothesized functions, a problem solving phase to find a specific function, and the ability to recycle if necessary. Tests of the model revealed that it does a good job of getting the same answers as Ss and explained some, not most, of the process leading up to the answers. Due to the contrived nature of the task the model is most appropriate for understanding routine scientific inference. (18 ref)—*Journal abstract*.

4394. Graesser, Cheryl C. & Anderson, Norman H. (U California, San Diego) **Cognitive algebra of the equation: Gift size = generosity = income.** *Journal of Experimental Psychology*, 1974(Oct), Vol 103(4), 692-699.—In 2 experiments, a total of 48 undergraduate Ss judged a stimulus person on 3 dimensions: Generosity, Gift Size, and Income. Judgments on each dimension were based on information about the remaining 2 dimensions presented in a  $4 \times 4$  design. The information about Generosity and Income combined multiplicatively to yield the judged Gift Size, as was hypothesized. Judgments of Generosity and Income, however, did not exhibit the proposed multiplying form. Instead, these judgments followed a predominately additive integration rule. This pattern of results agrees with a collateral report by N. H. Anderson and C. A. Butzin (1974). The 2 studies indicate (a) a simple multiplying rule is easier for Ss than a comparative or ratio rule and (b) even when the integrative task is complex, judgment follows some simple algebraic model.—*Journal abstract*.

4395. Hogarth, Robin M. (INSEAD, The European Inst of Business Administration, Fontainebleau, France) **Process tracing in clinical judgment.** *Behavioral Science*, 1974(Sep), Vol 19(5), 298-313.—Reconciles the process-trace and mathematical-model approaches to judgmental processes of human organisms by combining the methodological objectivity of the latter with the theoretical orientation of the former. A theoretical model is constructed as a function of situational demands and the limits of human information-processing abilities. Suitable to situations where a choice has to be made between several ordinally related alternatives, the model depicts the cognitive process as a multistage discrimination procedure. A methodology is developed to test the theoretical notions by depicting the cognitive process in the form of a decision tree with separate sets of rules applicable to the various nodes. The predictive test of cross-validation indicates that the better models developed here perform at a level similar to conventional statistical models of judgment. Results show promise for investigating those substantive issues which mathematical models have failed to illuminate. (24 ref)—*Journal abstract*.

4396. Hornby, Peter A. (State University Coll New York, Plattsburgh) **Surface structure and presupposition.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Oct), Vol 13(5), 530-538.—Measured frequency of perceptual errors as a function of differential presupposition in descriptive sentences. In Exp I, 64 undergraduates heard a cleft or pseudocleft sentence prior to tachistoscopic presentation of a picture in which the presupposed proposition or the focused proposition was misrepresented. The task was to decide if the sentence correctly described the picture. Results indicate that more errors occurred when the misrepresentation in-

volved the presupposition than when it involved the focused proposition. Exp II, with 30 Ss, was conducted to determine if the frequency of errors was a function of the type of surface structure employed to mark the presupposition. Results indicate that several different surface structure features of English, employed in combination, increased the presuppositional strength of the sentence. (24 ref)—*Journal abstract*.

4397. Kubicek, Lorraine F. & Erdelyi, Matthew H. (Rutgers State U, Douglass Coll) **Effects of priority instructions on processing hypercapacity sequential inputs of pictures and words.** *Journal of Experimental Psychology*, 1974(Oct), Vol 103(4), 729-731.—Assessed the ability of 102 undergraduates to process selectively pictures or words presented in very rapid succession. Ss viewed a series of 36 verbal or pictorial slides for 225 msec each, with 775 msec between the items. Half of the Ss received priority instructions to attend selectively to animal items in the stimulus series. Another group, the nonpriority Ss, were merely told to attend to the series in general. Priority instructions enhanced recognition memory for both pictorial and verbal target items relative to nontarget items.—*Journal abstract*.

4398. Mueller, Edward; Kennedy, John M. & Tanimoto, Stephen. (Boston U) **Inherent perceptual motivation and the discovery of structure.** *Journal of Structural Learning*, 1972, Vol 3(4), 1-6.—Studied adults' observation of sequences of cards that began with random forms and terminated with recognizable letters or vice versa. Other Ss saw only the endpoints of such sequences. 2 hypotheses were tested: (a) That Ss will prefer to see a transformational sequence arriving at a recognizable structure than the reverse; (b) That Ss' preference judgments are based on endpoints rather than transformation. 8 undergraduates took part in each of 2 experiments in which both hypotheses were supported. It is concluded that the emergence of structure is the determinant of the preference for one kind of sequence.—*R. S. Albin*.

4399. Shanteau, James. (Kansas State U) **Component processes in risky decision making.** *Journal of Experimental Psychology*, 1974(Oct), Vol 103(4), 680-691.—Conducted 2 experiments with 12 paid female undergraduates and 26 undergraduates receiving course credit, respectively. The Ss judged the subjective worth of bets defined entirely by verbal phrases such as "somewhat unlikely to win sandals." A theory of information integration predicts that the subjective values of probability and payoff should combine by multiplying. Procedures from functional measurement were applied to test the model and to scale the subjective values of verbal probabilities and payoffs. Data from both experiments support the model. The Ss also judged 2-part bets such as "highly probable to win watch" and "toss-up to win bicycle." The theory predicts that the worths of the 2 parts should combine by adding. In both experiments, however, the judged worth of 2-part bets was less than the sum of the worths of the parts. This subadditivity effect was also found in reanalyses of earlier studies on commodity bundles. This raises serious questions about the traditional additive utility approach to risky decision making. (23 ref)—*Journal abstract*.

4400. Wearing, Alexander J. (U Melbourne, Vic, Australia) **Task differences and word class effects in sentence processing.** *Australian Journal of Psychology*, 1974(Aug), Vol 26(2), 131-138.—Conducted an experiment with 52 undergraduate volunteers to resolve an apparent disagreement in the literature concerning the importance of the role of the verb in sentence processing. Previous results were confirmed in that the verb was found to be important in judgments of sentence meaning but less significant in sentence storage. However, form class differences in storage held only for high potency terms. (28 ref)—*Journal abstract*.

4401. Well, Arnold D. & Green, Joanne. (U Massachusetts, Amherst) **Effects of color differences in a letter matching task.** *Psychonomic Science*, 1972(Oct), Vol 29(2), 109-110.—A total of 26 undergraduates judged whether pairs of letters were identical with respect to name (Exp I) or form (Exp II). Results replicate M. I. Posner and R. F. Mitchell's 1967 finding that physically identical letters could be matched more quickly than those only sharing the same name. When members of a letter pair differed in color, Ss showed a small but reliable tendency to respond more slowly when making "same" judgments, even when the letters only shared the same name. "Different" judgments were unaffected by color differences. To account for the effects of color variation, it seems necessary to consider both distraction and response competition factors.—*Journal abstract*.

#### Learning & Thinking & Conditioning

4402. Baird, Raymond. (Wright State U) **Congruence and negative information as determinants of answers to questions of entailment.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Oct), Vol 13(5), 545-550.—21 undergraduate volunteer Ss attempted to answer questions based on premise information which was congruent or noncongruent with the form of the question. 3 types of congruence were varied as well as whether the premise was based on positive or negative information. Attribute congruence facilitated answering questions, but thematic congruence did not. Subject nominal congruence interacted with positive-negative premise. Subject nominal congruence facilitated performance only following negative premise information.—*Journal abstract*.

4403. Biederman, Irving; Rabinowitz, Jan C.; Glass, Arnold L. & Stacy, E. Webb. (State U New York, Buffalo) **On the information extracted from a glance at a scene.** *Journal of Experimental Psychology*, 1974(Sep), Vol 103(3), 597-600.—Presented jumbled and coherent scenes for 20-300 msec. Ss selected from a pair of labels the one they considered a better description. In Exp II, a cue designated one object. Jumbling reduced both the accuracy of identification of cued objects and of descriptor choice.

4404. Brown, Alan S. (Southern Methodist U) **Examination of hypothesis-sampling theory.** *Psychological Bulletin*, 1974(Nov), Vol 81(11), 773-790.—Recent work on human concept identification behavior has stressed the role of hypotheses in guiding Ss' responses. The present article deals with the empirical validity of the assumptions made by the various models of hypothesis behavior. 5 general classes of assumptions are

examined: basic (exclusion of hypothesis learning, hypothesis as the unit of behavior, and response generation); learning (all-or-none vs strength); transition (hypothesis switch after positive, negative, and no feedback); sampling of single hypotheses (assuming no memory, perfect memory, and partial memory); and sampling of groups of hypotheses (subset and dimensional sampling). Other methodological and interpretive problems in the literature are noted. (62 ref)—*Journal abstract*.

4405. Buchwald, Alexander M. & Meagher, Robert B. (Indiana U) **Immediate and delayed outcomes: Learning and the recall of responses.** *Journal of Experimental Psychology*, 1974(Oct), Vol 103(4), 758-767.—In earlier Thorndikian experiments, Ss have performed better on Trial 2 when they were told whether Trial 1 responses were right or wrong on Trial 2 than when given this information immediately after each response on Trial 1. In the 1st experiment reported here, 96 undergraduate Ss given 23 learning trials failed to show a similar effect. It was hypothesized that this discrepancy was due to the difficulty that Ss with delayed information had in recalling responses made on trial  $n$  when they had recalled the response made on trial  $n-1$  but had been told on trial  $n$  that it was wrong. In Exps II and III an additional 196 Ss were asked to recall their previous responses after 2 trials with either immediate or delayed information. Results tend to support the hypothesis.—*Journal abstract*.

4406. Calef, Richard S.; Calef, Ruth A.; Bone, Ronald N. & Buttermore, Grant. (West Virginia Wesleyan Coll) **A human analogue of discrimination contrast: S-contrast as a function of magnitude of S+.** *Psychonomic Science*, 1972(Oct), Vol 29(2), 118-119.—In a study with 24 undergraduates, 2 groups of Ss received differential reward conditioning for accurately tracing red or blue star patterns. A control group received only small reward in both discriminanda. Results replicate the findings of previous animal and human studies in that a significant negative discriminandum contrast effect was found. This effect increased as a function of the magnitude of reward in the positive discriminandum. The latter finding has been obtained previously with infrahuman Ss but evidently not with human Ss; hence, it is concluded that the generality of negative discriminative contrast effects has been extended significantly.—*Journal abstract*.

4407. Deffenbacher, Kenneth A.; Platt, Gary J. & Williams, Mark A. (U Nebraska, Omaha) **Differential recall as a function of socially induced arousal and retention interval.** *Journal of Experimental Psychology*, 1974(Oct), Vol 103(4), 809-811.—32 male undergraduates were given a paired-associate list and then tested for recall either 2 or 45 min later. Arousal level at time of learning was manipulated by E observing some Ss. Precisely the same form of Arousal  $\times$  Retention Interval interaction found by R. Geen (see PA, Vol 51:10442) was obtained; observed Ss recalled fewer items at 2 min than did unobserved Ss, while this relationship was reversed at 45 min ( $p < .01$ ). However, Geen's self-report measures of socially induced arousal did not appear to be sensitive to possible differential amounts of arousal in these male Ss.—*Journal abstract*.

4408. Dempster, Frank N. & Rohwer, William D. (U California, Inst of Human Learning, Berkeley) **Component analysis of the elaborative encoding effect in paired-associate learning.** *Journal of Experimental Psychology*, 1974(Sep), Vol 103(3), 400-408.—Conducted 3 experiments to investigate the effect of elaborative encoding instructions on 3 components of paired-associate performance: stimulus recognition, response learning, and associative learning. 96 6th graders were given noun-pair lists to learn using 1 of 2 kinds of elaboration instructions (interactive imagery or sentence) or using separate imagery, standard, or repetition instructions. Results show that the major effect of elaboration instructions occurred on the associative measures. Contrary to a previous report, however, stimulus recognition was also enhanced by elaboration instructions. The effect appears to be more compatible with an encoding interpretation than with one that emphasizes the role of associative cues at the time of recognition testing. Response learning as measured by equating response availability and by free response recall was little affected, and only by interactive imagery instructions. (19 ref)—*Journal abstract*.

4409. Detterman, Douglas K. & Brown, Jane. (Case Western Reserve U) **Order information in short-term memory.** *Journal of Experimental Psychology*, 1974(Oct), Vol 103(4), 740-750.—A total of 280 undergraduates participated in 3 experiments concerned with ordinal recall. Ss recalled the serial position of an item by writing it in the appropriate space on a numbered answer sheet with no constraint on the order in which items were recalled. Exps I and II compared ordinal recall to free recall with both within- and between-Ss designs and with method of recall specified before and after list presentation. Results indicate that (a) retention of item information was unaffected by retention of order information as reflected by nearly equivalent item retention for both methods of recall, (b) not knowing which method of recall would be used before list presentation had little influence on retention of item information but had substantial effects on the shape of the serial position curve, and (c) order information was retained at high levels in both experiments. In Exp III, the effects of presentation rate, list length, and total time on ordinal recall were investigated. Increases in item retention were mainly attributable to longer total study times, while increases in order retention were solely a function of study time per item. (17 ref)—*Journal abstract*.

4410. Einhorn, Hillel J. (U Chicago, Graduate School of Business) **Expert judgment: Some necessary conditions and an example.** *Journal of Applied Psychology*, 1974(Oct), Vol 59(5), 562-571.—Studied characteristics of expertise in situations where judges deal with multidimensional information. Psychometric criteria were advocated as being indicative of expert judgment: (a) Experts should tend to cluster variables in the same way when identifying and organizing cues; (b) expert judgment should be highly reliable (intrajudge reliability), show both convergent and discriminant validity, and be relatively free of judgmental bias when measuring cues; and (c) experts should weight and combine information in similar ways. These criteria were applied to data obtained when 3 medical pathologists rated the

amount of histological signs in biopsy slides. Results show that these experts generally met the criteria, although they did not seem to weigh information similarly. (20 ref)—*Journal abstract*.

4411. Einstein, Gilles O.; Pellegrino, James W.; Mondani, Michele S. & Battig, William F. (U Colorado) **Free-recall performance as a function of overt rehearsal frequency.** *Journal of Experimental Psychology*, 1974(Sep), Vol 103(3), 440-449.—Examined overt and silent rehearsal conditions under simultaneous and successive free-recall list presentation, using unrelated words on a varied-order multitrial list and on another list with 1 isolated item. Ss were 20 undergraduates in each of 5 conditions. Simultaneous presentation produced better recall and increased rehearsals which were more consistent both with input and recall output orders than under successive presentation, but neither showed substantial relationships of rehearsal to recall organization. Item rehearsal-recall correspondences were minimal on later trials, reflecting maximal rehearsal of newly recalled items. Isolated-item recall was markedly facilitated despite the fact that there was no increase in rehearsals, contrary to D. Rundus's 1971 findings. Thus, notable exceptions exist to any causal dependence of free-recall performance upon rehearsal activity. Possible explanations are discussed. (17 ref)—*Journal abstract*.

4412. Engel, G. R. (U Waterloo, Ontario, Canada) **On the functional relationship between word identification and letter probability.** *Canadian Journal of Psychology*, 1974(Sep), Vol 28(3), 300-309.—Investigated whether words made up of probable letters and probable letter combinations are more accurately recognized than words made up of improbable letters and improbable letter combinations. The experimental method corrected shortcomings in previous research which has shown accuracy of word recognition to be affected only by word probability and not by letter probability. The shortcomings were the confounding of different letter probability dimensions within one another. In the present investigation with 40 19-43 yr old adults, 100 words were assessed with respect to the probabilities of their letters and, independently, the conditional probabilities of their letters. Subsequent tests of recognition accuracy in a brief presentation showed accuracy to be greatest for words made up of letters having either high simple probabilities or high conditional probabilities. It is concluded that word recognition is an active, perhaps serial, process which makes liberal use of individual letter statistics to facilitate accurate recognition. (French summary)—*Journal abstract*.

4413. Epstein, Michael L. (Rider Coll) **Sex differences in incidental learning and recall of related and unrelated word pairs.** *Journal of Psychology*, 1974(Sep), Vol 88(1), 3-8.—Used a  $2 \times 2 \times 2 \times 2$  design to examine the effects of sex differences, grade, and processing levels in incidental learning and recall of paired associates. 72 college and 42 high school students processed 30 related and 30 unrelated word pairs by finding similarities or differences between paired items. Males showed better retention than females on a cued recall test, but only at the high school level. Recall of Ss at each grade level was significantly influenced by both pair relationship and processing task. Although recall

differences due to sex were thought to be caused by self-selection of Ss at the high school level, the Pair Relationship  $\times$  Processing Task interaction was explained within the framework of a "continuum" model of memory.—*Journal abstract.*

4414. Fritzen, James. (Virginia Polytechnic Inst & State U) **Partial repetition of digit strings with increased degree of learning.** *Journal of Experimental Psychology*, 1974(Sep), Vol 103(3), 391-393.—Conducted 2 experiments, each using 72 undergraduates as Ss, in which the initial portions of digit strings were varied from trial to trial, while the remaining digits were constant. In both experiments, the individual strings were presented more than once to enhance the degree of learning. Delayed recall (Exp I) and the degree of learning (Exp II) favored a repetition effect. These results call into question the notion that the 1st few digits in each string are used to address the strings in memory.—*Journal abstract.*

4415. Gavurin, Edward L. & Murgatroyd, Dorothy. (Herbert H. Lehman Coll, City U New York) **Personality correlates of anagram problem solving.** *Journal of Psychology*, 1974(Sep), Vol 88(1), 97-101.—Studied the relationship between personality and problem-solving by correlating anagram-solving performance with the 15 motivational traits measured by the Edwards Personal Preference Schedule (EPPS). Ss were 246 college students. Results reveal a clear-cut pattern of relationships in which significant positive correlations were obtained between the EPPS socially oriented needs of Affiliation, Succorance, Nurturance, and Heterosexuality, while significant negative correlations were obtained for Deference, Intraception, and Endurance. The findings suggest that anagram-solving is more sensitive to the socially oriented rather than the nonsocial needs of the solver and that Endurance shows promise as a measure of problem-solving rigidity.—*Journal abstract.*

4416. Greene, William A. & Wirth, Harry G. (Eastern Washington State Coll) **Operant conditioning of the skin resistance response with different intensities of light flashes.** *Bulletin of the Psychonomic Society*, 1974(Sep), Vol 4(3), 177-179.—Conducted an experiment with 72 undergraduates which used a dim flash of white light as the reinforcing stimulus. Results confirm earlier reports using similar procedures from another laboratory, show no differential effect of the illuminance of a reinforcing light, and contrast sharply with a study which failed to replicate previous studies using light flashes as the reinforcer. Assessment by postsession questionnaire yielded little evidence for awareness of the contingency relationship.—*Journal abstract.*

4417. Greeno, James G. (U Michigan) **Representation of learning as discrete transition in a finite state space.** In D. H. Krantz, R. C. Atkinson, R. D. Luce & P. Suppes (Eds), *Contemporary developments in mathematical psychology: I. Learning, memory and thinking*. San Francisco, CA: W. H. Freeman, 1974. xiii, 299 p. \$9.—Describes the application of finite Markov chains to the psychology of learning, and develops mathematical models using discrete-state systems to analyze theories of memorizing and conditioning. Experimental results and measurements are used to infer the kind of psychological process involved in each stage of learning; the process is analyzed into components operating on different levels,

and relationships between the components are clarified. (4 p ref)

4418. Grice, G. Robert; Hunt, Reed L.; Kushner, Bruce A. & Morrow, Charles. (U New Mexico) **Stimulus intensity, catch trial effects, and the speed-accuracy tradeoff in reaction time: A variable criterion theory interpretation.** *Memory & Cognition*, 1974(Oct), Vol 2(4), 758-770.—5 paid, young adult Ss responded to a 1,000-Hz tone of 50, 80, or 100 db. Catch trial conditions were none, blank trials, a red light, a noise, and an 1,800-Hz tone. Auditory catch signals were of the same intensities. RT distributions in the 1st 3 conditions are well described by a family of exponential growth functions dependent upon stimulus intensity and by the parameters of normal criterion distributions dependent upon catch trial conditions and between-session variability. Performance in the auditory catch trial conditions was not dependent upon the same set of sensory growth functions. Performance in these conditions is described by a 2-dimensional analysis of information transmitted as a function of time and interpreted in terms of variable criterion theory. The speed-accuracy tradeoff in this situation appears to depend upon differential rates of growth of intensity and associative information and the criterion used in responding to this information. (15 ref) —*Journal abstract.*

4419. Grings, William W.; Carey, Cheryl A. & Schell, Anne M. (U Southern California) **Comparison of two methods for producing response inhibition in electrodermal conditioning.** *Journal of Experimental Psychology*, 1974(Oct), Vol 103(4), 658-662.—Employed 24 paid graduate and undergraduate students to make a within-S comparison of 2 related procedures for negatively correlating a signal, or conditioned stimulus (CS), with a shock unconditioned stimulus (UCS) in differential conditioning of electrodermal responses (EDRs). One operation presented a nonreinforced stimulus (CS-) during reinforced trials for a 2nd stimulus (CS+). The other reinforced a stimulus (CS+) whenever it occurred alone but never reinforced a compound composed of that stimulus and a 2nd (inhibitory) stimulus (CSA). The conclusion that the CS- and CSA developed inhibitory properties was based on 3 classes of results: (a) during acquisition, there was clear differential responding to stimuli positively and negatively associated with the UCS; (b) on transfer trials, smaller responses were given to compounds of excitatory and inhibitory stimuli than to the excitatory stimuli alone; and (c) subjective judgments of expectation of shock paralleled the EDRs.—*Journal abstract.*

4420. Hall, Geoffrey. (U Sussex, Lab of Experimental Psychology, Brighton, England) **Transfer effects produced by overtraining in the rat.** *Journal of Comparative & Physiological Psychology*, 1974(Nov), Vol 87(5), 938-944.—In each of 2 experiments, 2 groups of 12 male hooded rats were trained on an orientation discrimination in the jumping stand, one group (CT) being trained to criterion and the other being given 150 trials of overtraining (OT). In Exp I the 2 groups did not differ when shifted to a black-white discrimination, but the OT group was superior in learning the reversal of the black-white problem. This result suggests that the beneficial transfer resulting from overtraining does not derive from an

increased tendency for the OT Ss to attend to the overtrained dimension. Exp II tested the hypothesis that overtraining produces positive transfer by reducing the Ss' tendency to take up position habits. The OT and CT groups were presented with a choice between oblique stimuli with neither alternative being rewarded. Both groups took up position habits, the OT slightly more rapidly than the CT, and thus the hypothesis was not confirmed. (15 ref)—*Journal abstract*.

4421. Haviland, Susan E. & Clark, Herbert H. (U California, Irvine) **What's new? Acquiring new information as a process in comprehension.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Oct), Vol 13(5), 512-521.—Linguistically, sentences contain both Given information (what the listener is expected to know already) and New information (what the listener is not expected to know already). According to a proposed Given-New Strategy, the listener, in comprehending a sentence, first searches memory for antecedent information that matches the sentence's Given information; he then revises memory by attaching the New information to that antecedent. To provide evidence for this strategy, a total of 53 university students were presented pairs of sentences, where the 1st (the context sentence) provided a context for the 2nd (the target sentence). Ss were required to press a button when they felt they understood the target sentences. Exp I showed that a target sentence with a definite noun phrase presupposing existence took less time to comprehend when its Given information had a and Exp III antecedent in the context sentence than when it did not. Exp II ruled out a repetition explanation for Exp I, and Exp III demonstrated the same phenomenon for target sentences containing the adverbs *istill*, *again*, *too*, and *either*. (18 ref)—*Journal abstract*.

4422. Hellige, Joseph B. & Grant, David A. (U Wisconsin, Madison) **Response rate and development of response topography in eyelid conditioning under different conditions of reinforcement.** *Journal of Experimental Psychology*, 1974(Sep), Vol 103(3), 574-582.—In 2 experiments, a total of 92 undergraduates were classified as voluntary (V) and conditioned (C) responders based on their predominant eyelid response topography. Response rate and development of an unconditioned stimulus (UCS) attenuating eyelid response topography were then examined during continuous classical reinforcement, instrumental avoidance reinforcement, and yoked intermittent classical reinforcement. In general, the Vs showed a better UCS-attenuating response topography than the Cs. The Vs developed the UCS-attenuating response topography over trial blocks during classical conditioning with both continuous and intermittent airpuff reinforcement, but not during instrumental avoidance conditioning. While the instrumental avoidance Cs gave more responses than their yoked counterparts who received intermittent classical reinforcement, the Vs showed exactly the reverse ordering. Results are discussed in terms of response learning processes during different modes of reinforcement, response learning differences in Vs and Cs, and possible differences between Vs and Cs in their classical conditioning parameters. (17 ref)—*Journal abstract*.

4423. Hersh, Harry M. (Johns Hopkins U) **The effects of irrelevant relations on the processing of sequential patterns.** *Memory & Cognition*, 1974(Oct), Vol 2(4), 771-774.—Letter series completion problems varying along location of irrelevant relations (beginning, end, or none) were presented to 24 paid university students. A repeated-measures analysis of solution times and errors revealed that irrelevant relations at the beginning of series produced the longest latencies and the most errors. Using a pattern-induction-sequence-production model of serial processing, an error analysis showed production error rate remained constant across treatments, while pattern induction errors varied with confusion location. Results indicate that the difficulty of sequential processing varies with irrelevant relations only during the pattern-induction phase. Findings also support a left-right generate-and-test model of pattern induction for the task.—*Journal abstract*.

4424. Hunt, R. Reed; Parente, Frederick J. & Ellis, Henry C. (U New Mexico) **Transfer of coding strategies in free recall with constant and varied input.** *Journal of Experimental Psychology*, 1974(Oct), Vol 103(4), 619-624.—Examined the effects of differing degrees of grouping structure or variation on recall of 180 undergraduate Ss for letter sequences. 3 levels of input variability (high, moderate, and zero) were employed, defined in terms of the number of different spatial grouping rules imposed upon the letter sequences. Degree of variation was manipulated both as a between- and a within-S variable during training and as a between-Ss variable in a subsequent transfer task. Recall was directly related to degree of input variability when treated as a between-Ss variable, indicating that S tended to ignore the E-imposed grouping and encode the sequence in a more unitary fashion when the input was more variable. In contrast, when input variability was treated as a within-S variable, recall was high and approximated that of the high-variability between-Ss condition. Recall in the transfer task was largely dependent upon the coding strategy developed during training and was unaffected by differing degrees of variation in the transfer task.—*Journal abstract*.

4425. Inagaki, Kayoko & Hatano, Giyoo. (Izumi Junior Coll, Japan) **Correlates of induced question-asking behavior.** *Japanese Psychological Research*, 1974(May), Vol 16(1), 50-57.—143 5th graders were encouraged to write 2 questions for each of 8 stories involving incongruity (novelty, surprise, contradiction, or perplexity). Questions were scored 1-5 according to use of information in the story, and to relating it to prior knowledge. Combined scores of 2 questions were positively correlated with each other among stories. Only 1 significant factor, explaining 27% of variance, was extracted from the correlation matrix. The sum of combined scores was significantly correlated with school grade and achievement-test score in language, intelligence, performance in science and in social studies, sensitivity to mismatch, verbal report of felt incongruity, and plot comprehension.—*Journal abstract*.

4426. Jarvella, Robert J. & Snodgrass, Joan G. (Rockefeller U, New York, NY) **Seeing ring in rang and retain in retention: On recognizing stem morphemes in printed words.** *Journal of Verbal Learning & Verbal*

*Behavior*, 1974(Oct), Vol 13(5), 590-598.—A total of 34 right-handed undergraduate Ss in 2 experiments judged whether pairs of words viewed simultaneously contained the same stem morpheme. Reaction times of same-different judgments were obtained for verb stems paired with inflected forms of the verbs (Exp I) and for verb stems paired with derived adjectives and nouns (Exp II). Same judgments were faster than different judgments in both studies and were faster when the stem was spelled in the same way in both words, regardless of pronunciation, than when it was spelled and pronounced differently. (16 ref)—*Journal abstract*.

4427. Just, Marcel A. & Brownell, Hiram H. (Carnegie-Mellon U) **Retrieval of concrete and abstract prose descriptions from memory.** *Canadian Journal of Psychology*, 1974(Sep), Vol 28(3), 339-350.—Examined how 24 undergraduates retrieved information from previously learned concrete or abstract prose descriptions to determine whether concreteness facilitates memory retrieval in some way aside from organizing the material. Ss read thematically organized paragraphs that described either concrete or abstract referents. The concrete paragraphs described physical features of a person, while the abstract paragraphs described personality features. Ss were then timed while they decided whether subsequent test sentences were true or false of the description. Responses were faster for concrete paragraphs. Since both types of paragraphs had an equivalent degree of thematic organization, results indicate that concreteness provides mnemonic power above that provided by an alternative organizational factor like thematic structure. (French summary) (25 ref)—*Journal abstract*.

4428. Katz, Stuart & Gruenewald, Paul. (U Georgia) **The abstraction of linguistic ideas in "meaningless" sentences.** *Memory & Cognition*, 1974(Oct), Vol 2(4), 737-741.—Proposed that J. D. Bransford and J. J. Franks's (see PA, Vol 48:4191 and 50:8220) linear effect is unrelated to semantic processes and will, therefore, occur even when meaningless sentences (i.e., sentences containing nonsense instead of meaningful content words) are employed. Within the Bransford and Franks format, 32 undergraduates were given either the meaningless sentences or control sentences. Results show a significant linear effect for the meaningless sentences. Furthermore, although the slope of the effect for meaningless sentences was flatter than that of the control, other data rule out a semantic integration explanation based on the availability of semantic information contained in sentence structure. A simple guessing strategy hypothesis is offered to account for the linear effect.—*Journal abstract*.

4429. Katz, Stuart, Atkeson, Beverly & Lee, Joanne. (U Georgia) **The Bransford-Franks linear effect: Integration or artifact?** *Memory & Cognition*, 1974(Oct), Vol 2(4), 709-713.—Hypothesized that J. D. Bransford and J. J. Franks's (see PA, Vol 48:4191 and 50:8220) linear effect is an artifact of the method of presentation of stimulus sentences and is unrelated to semantic processes. 48 undergraduate volunteers were given sentences containing the same information in 1 of 2 ways. In a control condition, which was identical to the procedure used in earlier research, overlapping combinations of ideas were presented during learning and recognition; in

an experimental condition, ideas were presented one at a time. Results demonstrate that one-idea sentences received significantly higher recognition confidence ratings in the experimental condition, thus supporting the artifact interpretation. It is proposed that Ss assign recognition confidence ratings based on the probability that a sentence containing a certain number of ideas could have occurred in acquisition.—*Journal abstract*.

4430. King, David J. (State University Coll New York, Oswego) **Total presentation time and total learning time in connected discourse learning.** *Journal of Experimental Psychology*, 1974(Sep), Vol 103(3), 586-589.—Manipulated total presentation time by variations in exposure interval, interitem interval, and rate of presentation. Regardless of how constructed, a given total presentation time resulted in a similar total learning time for 120 Ss. Except for the briefest of total presentation times, variations in total presentation time had but a minor effect, if any, on total learning time.

4431. Kirsner, Kim & Smith, Marilyn C. (U Western Australia, Nedlands) **Modality effects in word identification.** *Memory & Cognition*, 1974(Oct), Vol 2(4), 637-640.—Investigated the locus of persistence of information about presentation modality for verbal stimuli. 24 paid undergraduates were presented with a continuous series of 672 letter sequences for word-nonword categorization. The sequences were divided equally between words and nonwords, and each item was presented twice in the series either in the same or in a different modality. Repetition facilitation, the advantage resulting from a 2nd presentation, was greatest in the intramodality conditions for both words and nonwords. Facilitation was reduced in the cross-modality condition for words and was absent from the cross-modality condition for nonwords. The modality-specific component of the repetition effect found in the word-nonword categorization paradigm may be attributed to persistence in the nonlexical, as distinct from lexical, component of the word categorization process.—*Journal abstract*.

4432. Koriat, Asher & Lieblich, Israel. (Hebrew U Jerusalem, Israel) **What does a person in a "TOT" state know that a person in a "don't know" state doesn't know?** *Memory & Cognition*, 1974(Oct), Vol 2(4), 647-655.—Examined the significance of R. Brown and D. McNeill's (see PA, Vol 40:12901) findings regarding the "tip of the tongue" (TOT) phenomenon. A modified version of their procedure was used with 56 university students. Although Brown and McNeill's findings that Ss in a TOT state can detect parts and properties of the missing word were generally replicated, a division of the TOT state into a variety of substates showed correct detection rate to vary greatly, depending on the substate involved. In addition, correct detection of partial information was demonstrated even when S declared he had no knowledge of the selected word. It is suggested that a distinction be made between information detection based on knowledge of the characteristics common to the class of items of which the target is a member and detection based on knowledge of characteristics specific to the target in question.—*Journal abstract*.

4433. Kozielicki, Jozef. (Warsaw U, Inst of Psychology, Poland) **A model for solving diagnostic problems.** (Poln) *Przegląd Psychologiczny*, 1972, Vol 15(4), 3-15.

—The diagnostic process begins with a set of hypotheses with different probabilities. Relative probabilities change with accumulation of information which originates partly in the environment, and partly in the memory. The hypothesis which first reaches threshold is diagnosed as correct. The model contains 4 blocks. The 1st 2 are operative, (a) "goals" and (b) "operation," and have properties of recent memory. "Goals" decide on the hierarchy of diagnostic subgoals, and "operation" uses information from the last 2 blocks, (c) "memory" and (d) "environment," to change the probabilities of the hypotheses. The operative blocks can adopt different strategies, e.g., the catch-all strategy found in situations with many hypotheses and uncertain information, or the dichotomy strategy in simple situations. Some properties of the hypothesis-formation and information-utilization processes are described. (English & Russian summaries) (15 ref)—*I. Divac.*

4434. Krause, Merton S. (Inst for Juvenile Research, Chicago, IL) **What it is to learn a fact.** *Journal for the Theory of Social Behaviour*, 1973(Apr), Vol 3(1), 92-99. —Attempts to elucidate the process of learning a fact and to distinguish it from learning a statement. The epistemology of the process is described. Several patterns of events that constitute such learning are cited. Various theories of this kind of process are suggested: that of first-person psychology, of second-person psychology, and of third-person psychology. How cognitive learning operates in each of these 3 psychologies is discussed in detail. These ideas and concepts are considered in terms of their application to current educational systems. (20 ref)—*R. S. Albin.*

4435. Levine, Marvin. (State U New York, Stony Brook) **Interpreting inconsistent response patterns: A reaction to William's estimate of "true hypothesis behavior."** *Journal of Experimental Child Psychology*, 1974(Oct), Vol 18(2), 369-371.—Discusses B. R. Williams's (see PA, Vol 53:Issue 3) model that attempts to estimate true hypothesis behavior from inconsistent response patterns during sets of blank trials. Several kinds of data suggest that inconsistent response patterns are produced by systematic processes. These patterns, therefore, may not contribute to a simple estimate of true hypothesis behavior.

4436. Louviere, Jordan J. (Florida State U) **Predicting the evaluation of real stimulus objects from abstract evaluation of their attributes: The case of trout streams.** *Journal of Applied Psychology*, 1974(Oct), Vol 59(5), 572-577.—Studied human judgment behavior in 10 employees of Iowa trout hatcheries. In Phase 1 Ss judged hypothetical trout streams varying in quantity of trout and driving time to stream. In Phase 2 Ss judged real Iowa trout streams and estimated the quantity of trout and the driving time for each stream. These estimates were used in multiple regression equations, derived from the data in Phase 1, to predict the ratings of the real streams in Phase 2. Correlations between predicted and observed judgments ranged from .37 (individual S level) to .85 (group level). Results are consistent with empirical work in the number processing and nonexperimental work in geography and other spatially oriented sciences. (17 ref)—*Journal abstract.*

4437. Marcel, Tony & Forrin, Bert. (MRC Applied Psychology Unit, Cambridge, England) **Naming latency and the repetition of stimulus categories.** *Journal of Experimental Psychology*, 1974(Sep), Vol 103(3), 450-460. —Conducted 4 experiments with undergraduate and graduate students to investigate sequential facilitation effects in the naming of alpha-numeric characters. With a stimulus set of 4 letters and 4 digits, repetition of an item or a category facilitated reaction time (RT). The advantage of category and item repetitions over category alternations decreased (a) as the response-signal interval increased and (b) if advance information respecting the stimulus category was presented 1 sec (but not .5 sec) prior to stimulus onset. False advance information did not disturb the original latency differences between the 3 transition types. With a stimulus set of the digits 2-9, RT varied systematically with the digit's ordinal distance from the preceding one in the sequence. Results are interpreted as favoring an "associative priming" model for facilitation in character identification that is responsible for both item and category repetition effects. (28 ref)—*Journal abstract.*

4438. Mazurk, Gregory F. (U Toronto, Ontario, Canada) **Positive recency in final free recall.** *Journal of Experimental Psychology*, 1974(Oct), Vol 103(4), 812-814. —Recent studies suggest that the negative recency effect in final free recall is a function of the type rather than the amount of rehearsal given to terminal list items. From such findings it was predicted in the present experiment that by varying the type of rehearsal, positive recency in final free recall could be obtained. 24 Ss were presented with 14-item lists, and in all cases the 1st 10 items of each list were silently learned. During the presentation of the 10th item, Ss were given 1 of 3 cues to indicate the method by which the last 4 items were to be studied. These methods were overt rehearsal, silent study, and generating verbal associations for each of the 4 terminal list items. In agreement with earlier studies, results indicate a positive recency in final free recall for associated items.—*Journal abstract.*

4439. McKee, J. David. (Rutgers State U, Douglass Coll, New Brunswick) **The effect of problem difficulty on hypothesis testing and an extension of Levine's theory.** *Bulletin of the Psychonomic Society*, 1974(Sep), Vol 4(3), 188-190.—Examined working hypothesis (Hs) and majority rules under 4 conditions of problem difficulty achieved through combination of exposure or nonexposure of problem cards and informative feedback with 2 or 3 values per stimulus dimension. Memory aids facilitated solutions by 48 paid undergraduate Ss; intradimensional variability had no effect. Working Hs occurred more often in exposed conditions; majority rules were equally distributed throughout conditions. Ss demonstrated H behavior on 91.6% of all opportunities; working Hs were more prevalent than majority rules; and the size of the H pool supports M. Levine's (see PA, Vol 49:216) subset sampling assumption. However, some Ss changed Hs before and after "right" feedback. Analysis of such discrepant findings suggests an extension of Levine's model.—*Journal abstract.*

4440. Merikle, Philip M. (U Waterloo, Ontario, Canada) **Selective backward masking with an unpredictable mask.** *Journal of Experimental Psychology*,

1974(Sep), Vol 103(3), 589-591.—Presented rows of 7 random letters for 100 msec, followed by either a patterned mask or a blank white field. Ss could not anticipate whether or not a row would be followed by the mask. Since results show greater masking of center than end letters, selective masking cannot be attributed to different processing strategies under mask and no-mask conditions.

4441. Millward, Richard B. & Wickens, Thomas D. (Brown U) **Concept-identification models.** In D. H. Krantz, R. C. Atkinson, R. D. Luce & P. Suppes (Eds), *Contemporary developments in mathematical psychology: I. Learning, memory and thinking*. San Francisco, CA: W. H. Freeman, 1974. xiii, 299 p. \$9.—Briefly reviews the definition of a concept and the basic paradigms that have been used in analyzing how concepts are learned. An organized set of axioms for hypothesis-testing models of concept identification is constructed, and representative models are analyzed in detail. (39 ref)

4442. Murdock, Bennet B.; Anderson, Rita E. & Ho, Elaine. (U Toronto, Ontario, Canada) **Effects of presentation order on learning in multitrial free recall.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Oct), Vol 13(5), 522-529.—By an organization view, the formation of clusters and consequently the progress of interactive free-recall learning should be affected the order in which items are presented. Exp I with 12 undergraduate Ss failed to support an accretion hypothesis, which predicted that presenting the learned items in each cluster before the unlearned items should expedite learning relative to the reverse order. Exp II with 16 Ss showed that even scrambling some clusters while preserving others had relatively little effect, and the effects that were obtained were directly contrary to what had been expected. These results plus other recent related findings suggest that the characteristics of list presentation may have surprisingly little effect on the progress of multitrial free-recall learning. (19 ref)—*Journal abstract.*

4443. Murphy, Michael D. & Wallace, William P. (U Nevada, Reno) **Encoding specificity: Semantic change between storage and retrieval cues.** *Journal of Experimental Psychology*, 1974(Oct), Vol 103(4), 768-774.—In 3 experiments with a total of 240 undergraduate Ss, cue words were presented with to-be-remembered (TBR) words in an effort to influence specific encoding formats. Recall was tested in the presence of cues that were identical, semantically similar, or semantically dissimilar to the input cues. In all 3 cases the recall cues and the input cues were semantically similar to the TBR words. The only evidence for cuing facilitation (relative to free recall) occurred when the same cues appeared at both input and output. Changing cues from input to output produced recall decrements relative to free recall, although there was evidence for encoding specificity as the presentation of recall cues semantically similar to input cues was associated with higher levels of recall than the presentation of recall cues semantically dissimilar to input cues.—*Journal abstract.*

4444. Murray, Harry G. & Carruthers, Benjamin C. (U Western Ontario, London, Canada) **Human eyelid conditioning with airpuff vs infraorbital shock as the UCS.** *Canadian Journal of Psychology*, 1974(Sep), Vol 28(3), 269-287.—In each of 3 experiments, a total of 188

college students received classical eyelid conditioning with either a corneal airpuff or a subjectively matched infraorbital shock as the unconditioned stimulus (UCS). It was expected that conditioning levels would be higher for the presumably more "modifiable" airpuff UCS. Contrary to expectation, infraorbital shock produced superior conditioning in all 3 experiments. However, Ss' ratings of airpuff and shock aversiveness in Exps II and III were negatively correlated with anticipatory conditioned responses, indicating that an instrumental reinforcement mechanism operates for both UCS modalities. Results are discussed in terms of contiguity and effect models of classical conditioning. (French summary) (15 ref)—*Journal abstract.*

4445. Murray, Harry G. & Ure, Gail. (U Western Ontario, London, Canada) **Role of temporal contiguity in intentional and incidental paired-associate learning.** *Journal of Experimental Psychology*, 1974(Oct), Vol 103(4), 816-820.—Consonant-vowel-consonant (CVC) trigram pairs were presented as "distracting stimuli" to 180 university students in the context of a probability-learning orienting task, with an interstimulus interval (ISI) of .8, 3.0, or 6.0 sec between the 1st and 2nd stimulus of each pair. Intentional Ss were told to learn the CVC pairs, whereas incidental Ss were given no instructions to learn. Performance on subsequent test trials was a decreasing function of the ISI for incidental Ss and an increasing function of the ISI for intentional Ss. Results suggest that, at least under certain orienting conditions, incidental and intentional paired-associate learning may involve different underlying processes.—*Journal abstract.*

4446. Neisser, Ulric. (Cornell U) **Practiced card sorting for multiple targets.** *Memory & Cognition*, 1974(Oct), Vol 2(4), 781-785.—8 paid university students were given extended practice in card sorting. Each card was inscribed with 9 letters; on half the cards 1 letter was a "target." With practice, the Ss could sort as fast for 8 targets at once as for a single difficult target, while maintaining the same overall error rates. However, they did miss the difficult target itself more often when it occurred in the multiple-target condition than when they were searching for it alone.—*Journal abstract.*

4447. Neumann, Paul G. (U Colorado) **Effects of directional and neutral category labels in bidimensional rule-learning problems.** *Memory & Cognition*, 1974(Oct), Vol 2(4), 695-699.—In bidimensional concept problems, the distinction between primary and complementary rule forms is, in some sense, a function of the directional nature of the sorting category labels. Primary rules are those rules which assign the true-true class to the "positive" category. Complementary rule forms are obtained by reversing these category assignments. Instead of directional labels, neutral labels can be used. Reversing these labels creates no fundamental change in the solution of the problem. An experiment with 150 undergraduate psychology students investigated the effect of directional and neutral category labels in a design which incorporated all 12 problems defined by the combination of directional and neutral labels. Significant effects of labels on performance were obtained. Implications of these effects for hypotheses advanced by J. L. Seggie (1969), K. G. Peters and J. P.

Denny (1971), and L. E. Bourne and D. E. Guy (1968) are discussed.—*Journal abstract.*

4448. Nosal, Czeslaw. (Wroclaw Technical U, Poland) **[Mental abilities underlying effective thinking.]** (Polh) *Przegląd Psychologiczny*, 1972, Vol 15(4), 33-48.—Reviews the literature on the thought process in problem solving. Based on this review, the process is schematically conceived as a chain of action blocks: analysis of the problem situation (APS), generation of solution possibilities (GSP), evaluation of these (ESP), and realization of the adopted solution (RAS). Each action-block feeds both forward and backward. The outcome of a thought process depends on more than one ability, and given ability may play a role in more than one outcome. APS depends on efficient orientation in the problem situation, elimination of uncertainties, and reduction of information. GSP is based on fluency, flexibility, originality of thinking, and ability to grasp diverse relations simultaneously. ESP is related to the capacity for logical and experimental evaluation, judgment, and other factors. RAS involves planning action, realization of plans, and control and correction of action. Each of these abilities is discussed and analyzed. (40 ref)—*I. Divac.*

4449. Pate, James L.; Ward, Patricia & Harlan, Katherine B. (Georgia State U) **Effects of word order and imagery on learning verbs and adverbs as paired associates.** *Journal of Experimental Psychology*, 1974(Oct), Vol 103(4), 792-795.—In 4 paired-associate studies with verbs and adverbs, more correct responses by a total of 248 undergraduate Ss occurred with the verb-adverb order than with the adverb-verb order. Results are similar for the anticipation method and for the study-test procedure. In 1 study, stimulus imagery and response imagery were combined factorially with word order. While both stimulus imagery and response imagery had significant effects, word order was an even more potent factor.—*Journal abstract.*

4450. Penney, Catherine G. (Memorial U Newfoundland, St John's, Canada) **Order of report and interference effects in four-channel bisensory memory.** *Canadian Journal of Psychology*, 1974(Sep), Vol 28(3), 371-382.—Used a 4-channel bisensory-dichotic presentation with a total of 6 graduate and undergraduate students who were postcued to recall only the auditory words, only the visual words, or all words. On total recall trials, words were recalled separately by modality. On auditory recall trials, a sequential recall order predominated. The modality of the postlist cue interacted with presentation modality of the memory words such that an auditory cue interfered with recall of auditory words and the visual cue with recall of visual words. Implications for theories of short-term memory are discussed. (French summary) (28 ref)—*Journal abstract.*

4451. Pezdek, Kathy & Royer, James M. (U Massachusetts, Amherst) **The role of comprehension in learning concrete and abstract sentences.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Oct), Vol 13(5), 551-558.—Conducted 2 experiments with a total of 140 undergraduate Ss to assess the effect of comprehension on the recognition of meaning and wording changes with concrete and abstract sentences. One group of Ss was presented the sentences embedded in a context paragraph designed to increase comprehension. Recognition

for meaning changes in abstract sentences was significantly higher for the paragraph-embedded group than for a group presented the sentences without the paragraphs. There was no appreciable differences between the groups in recognition for wording changes in abstract sentences, nor in recognition for both meaning changes and wording changes in concrete sentences. Results are discussed in light of recent models which propose different storage mechanisms for concrete and abstract sentences.—*Journal abstract.*

4452. Polich, John M. & Schwartz, Steven H. (Wayne State U) **The effect of problem size on representation in deductive problem solving.** *Memory & Cognition*, 1974(Oct), Vol 2(4), 683-686.—180 undergraduates attempted to solve logical deductive reasoning problems that varied systematically in amount of information presented. Methods which Ss employed in representing the problem were classified into 5 main types or modes. The proportion of Ss using a matrix mode of problem representation increased moderately with problems containing large amounts of information. The performance of Ss using a matrix mode of representation suggests that this advantage is related to ease of applying and/or storing the results of logical operations in such a problem space rather than to any facilitative effects of encoding processes. Specific limits to normal processing are hypothesized.—*Journal abstract.*

4453. Reich, Carol M. (Board of Education for the City of Toronto, Ontario, Canada) **The generalization of assertions throughout a cognitive network.** *Canadian Journal of Psychology*, 1974(Sep), Vol 28(3), 288-299.—30 undergraduates gave answers to sentence pairs of the following form: "Martians hate robins. Do Martians hate birds?" Objects of the sentence pairs were related as 1st- and 2nd-level superordinate and subordinate, and similar and dissimilar coordinate. Generalization between levels was consistent with a model based on judgment of set-subset relations among the object sets to which concepts refer. Coordinate generalization was described by a 2nd model based on judgments of the proportion of properties shared by 2 concepts. Implications of these findings for research on the syllogism are discussed. (French summary) (15 ref)—*Journal abstract.*

4454. Reid, J. Raymond. (U Victoria, British Columbia, Canada) **Sentence-type variables as aural concept formation dimensions.** *Journal of Psycholinguistic Research*, 1974(Jul), Vol 3(3), 233-245.—An aural conjunctive concept formation experiment with 64 undergraduates used as stimuli sentences varying systematically in voice (active or passive), mood (declarative or interrogative), modality (affirmative or negative), tense, and lexical content. Target classes were the 8 sentence types defined by all combinations of the 1st 3 syntactic variables. Aural processing was found to be more difficult than visual, but higher education level facilitated concept acquisition for males and females equally. Ss tended to avoid syntactic analysis in depth, classifying sentences on as cursory a basis as the task allowed. The simple, unequivocal syntactic signals of mood and modality meaning were readily apparent, but the discrimination of voice was complicated by ambiguous syntactosemantic associations and lack of discourse context. It is suggested that voice is not a determinant of

utterance type, but a context- and content-dependent realization of agent or object focus in transitive messages. (24 ref)—*Journal abstract*.

4455. Resick, Patricia A.; Forehand, Rex & Peed, Steve. (U Georgia) **Prestatement of contingencies: The effects on acquisition and maintenance of behavior.** *Behavior Therapy*, 1974(Oct), Vol 5(5), 642-647.—Examined the effects of prestatement contingencies, tangible plus verbal rewards, and tangible reinforcement alone on behavior acquisition. 32 4-6 yr old Ss were divided into 4 groups according to prestatement vs no prestatement of contingencies and tangible reinforcers vs tangible plus verbal reinforcers. Results indicate that nonprestatement of contingencies facilitated maintenance of behavior. Furthermore, Ss exposed to prestatement contingencies discriminated between reinforced and nonreinforced trials by the presence vs absence of contingency prestatement.—*Journal abstract*.

4456. Ritterman, Stuart I. & Freeman, Nancy C. (U South Florida) **Distinctive phonetic features as relevant and irrelevant stimulus dimensions in speech-sound discrimination learning.** *Journal of Speech & Hearing Research*, 1974(Sep), Vol 17(3), 417-425.—Required 32 college students to learn the relevant dimension in each of two randomized lists of auditorily presented stimuli. The stimuli consisted of 7 pairs of consonant-vowel nonsense syllables differing by 2 relevant dimension units and from 0 to 7 irrelevant dimension units. Stimulus dimensions were determined according to S. Saporta's units of difference. No significant differences in performance as a function of number of the irrelevant dimensions nor characteristics of the relevant dimension were observed. (20 ref)—*Journal abstract*.

4457. Ross, Leonard E.; Ferreira, M. Cecilia & Ross, Susan M. (U Wisconsin, Madison) **Backward masking of conditioned stimuli: Effects on differential and single-cue classical conditioning performance.** *Journal of Experimental Psychology*, 1974(Oct), Vol 103(4), 603-613.—In 3 experiments a total of 88 undergraduates who demonstrated good differential eyelid conditioning performance received an additional session during which a backward masking stimulus was presented during the conditioned stimulus (CS)-unconditioned stimulus (UCS) interval on half of the trials. In a group for which the interval between CS onset and masking stimulus onset (SOA) was selected to produce masking, differential responding was largely eliminated on masking trials. Such was not the case for a longer SOA control condition. Similar masking effects were obtained with visual and auditory differential conditioning, but backward masking did not occur in single-cue conditioning. The similarities of these effects to those obtained in the usual masking studies are discussed with respect to the recognition processes involved and their role in differential and single-cue conditioning.—*Journal abstract*.

4458. Runquist, Willard N. (U Alberta, Edmonton, Canada) **Structural effects of identical elements among stimuli with meaningful units.** *Journal of Experimental Psychology*, 1974(Sep), Vol 103(3), 592-593.—In 2 paired-associate experiments, one using word triads and the other symbol triads as stimuli, the complexity of the pattern of identical elements strongly influenced undergraduates' performances. This shows that the failure of

structure to have an effect with single words is not due to meaning. The critical variable is whether the elements of the stimuli are processed separately or not.

4459. Sanford, A. J. & Seymour, P. H. (U Dundee, Scotland) **Semantic distance effects in naming superordinates.** *Memory & Cognition*, 1974(Oct), Vol 2(4), 714-720.—Conducted 3 experiments in which a total of 32 university students and staff and 16 high school students served as Ss. Results show that the time to select a superordinate label in response to a target word was a function of the normative likelihood of the target being produced as an exemplar of the superordinate. This extends the scope of semantic distance effects to a new task situation. The effect declined with practice (repetition) and was also reduced by other preceding tasks. 2 alternative accounts of the processing underlying selection are discussed.—*Journal abstract*.

4460. Schultz, Randall L. (Purdue U) **System simulation: The use of simulation for decision making.** *Behavioral Science*, 1974(Sep), Vol 19(5), 344-350.—Suggests that, when simulation is intended as an aid to decision making by individuals or organizations, special problems arise in connection with designing and using the model. The use of policy simulation and factors related to its application are explored, and implications for model development are presented. (37 ref)

4461. Schulster, Jerome R.; McLaughlin, John P. & Crouse, James H. (U Delaware) **Separation of storage and retrieval processes in recall of prose.** *Journal of Experimental Psychology*, 1974(Sep), Vol 103(3), 583-586.—Studied the primacy effect in prose free recall with 192 students. Results imply that proactive interference may affect the nature of retrieval cues in memory, and that output interference generated during the recall task may hinder recall. This interference seemed to affect recall of later input stories.

4462. Seybert, Jeffrey A.; Wrather, Dan M.; Kanak, N. Jack & Eckert, Ed. (U Oklahoma) **Interaction of drive level and task complexity in verbal discrimination learning.** *Journal of Experimental Psychology*, 1974(Oct), Vol 103(4), 795-798.—Performed an experiment to test predictions based on a combination of the frequency theory of verbal discrimination learning and Taylor-Spence drive theory, the latter of which postulates a Drive Level  $\times$  Task Complexity interaction. 36 high-drive and 36 low-drive undergraduates, as determined by scores on the Taylor Manifest Anxiety Scale, were Ss. 3 list conditions derived from the frequency theory of B. R. Ekstrand et al (see PA, Vol 41:212) were used: an associate-both (AB) list which is relatively difficult or complex, a same-right (SR) list which is relatively easy or simple, and a control (C) list of moderate difficulty. An interaction of Drive  $\times$  Task Complexity was observed, both in terms of trials to criterion and total errors. High-drive Ss performed better than low-drive Ss on the SR list, while the reverse was true for the AB list.—*Journal abstract*.

4463. Shaughnessy, John J.; Zimmerman, Joel & Underwood, Benton J. (Northwestern U) **The spacing effect in the learning of word pairs and the components of word pairs.** *Memory & Cognition*, 1974(Oct), Vol 2(4), 742-748.—Following the presentation of a single list of word pairs consisting of a 3-letter word on the left and a

5-letter word on the right. 5 groups of 64 undergraduates each were asked to recall the (a) 3-letter words, (b) 5-letter words, (c) intact pairs, or (d) 5-letter words with the 3-letter words provided. 2 types of repeated pairs were presented, one in which the same 3- and 5-letter words were repeated together (same pairs) and one in which the same 5-letter word was repeated with different 3-letter words (different pairs). For half of the Ss in each recall group, the repetitions of a pair containing a given 5-letter word were massed (MP); for the other half, the repetitions were distributed (DP). Recall of MP same pairs and the components of these pairs was consistently poorer than that of DP same pairs. Recall of the repeated component of the different pairs was also poorer under MP than under DP. Results support an attenuation-of-attention explanation of the spacing effect.—*Journal abstract.*

4464. Simon, Herbert A. & Newell, Allen. (Carnegie-Mellon U) **Thinking processes.** In D. H. Krantz, R. C. Atkinson, R. D. Luce & P. Suppes (Eds), *Contemporary developments in mathematical psychology: I. Learning, memory and thinking*. San Francisco, CA: W. H. Freeman, 1974. xiii, 299 p. \$9.—Examines formal theories of human thinking, specifically those that are formulated in information-processing language. Application of information-processing theory to human problem solving, to verbal learning and related conceptual processes, and to human discovery of serial patterns is detailed. (36 ref)

4465. Smith, Kendon. (U North Carolina, Greensboro) **A note on the possibility of a reinforcement theory of cognitive learning.** *Bulletin of the Psychonomic Society*, 1974(Sep), Vol 4(3), 161-163.—Reviews recent studies which support an essentially neo-Tolmanian view of motivation and learning. However, it is suggested that, although this approach has a certain phenomenal validity, cognitive linkages are formed not by contiguity alone, but by contiguity plus a species of secondary reinforcement. It is also proposed that such linkages, when activated by the environment, result in a surrogate learning experience, the latter being responsible for the overt behavior which then occurs. (18 ref)—*Journal abstract*

4466. Tests, Thomas J. (U Illinois) **Causal relationships and the acquisition of avoidance responses.** *Psychological Review*, 1974(Nov), Vol 81(6), 491-505.—Discusses 2 explanations of belongingness. One explanation postulates the evolution of event-specific associative mechanisms which associate events related in the environment. Another explanation suggests that certain events covary in a manner which improves associability. 2 forms of event-covariance are considered: similarity in the location and in temporal intensity patterns of the to-be-associated events. Published data are reviewed and new data are presented which indicate that these factors facilitate associability. Distinctions are drawn between event-specific associative mechanisms (activated by the to-be-associated events) and nonspecific associative mechanisms (activated by forms of event covariance). It is suggested that nonspecific mechanisms evolved to handle learning about real-world causal relationships which are variable with respect to the events involved. The explanatory power of this approach

is applied to the acquisition of avoidance responses. (46 ref)—*Journal abstract.*

4467. Thomas, David R.; Strub, Harry & Dickson, James F. (U Colorado) **Adaptation level and the central tendency effect in stimulus generalization.** *Journal of Experimental Psychology*, 1974(Sep), Vol 103(3), 466-474.—Conducted 2 experiments with 220 undergraduates divided into 11 groups of 10 males and 10 females each. In Exp I, 7 groups were presented a dim light and then tested for recognition (generalization) with test stimuli including the original and several brighter values. The groups differed in the range and number of test values employed (from 3 to 9). On each trial, S judged the test stimulus as same as or different from the original and also rated it on a 9-point brightness scale. This provided generalization and adaptation level (AL) measures. Both AL and maximal generalized responding shifted to higher stimulus values with longer test series (i.e., with greater test asymmetry). In Exp II, 4 groups of Ss were tested with a long or short range of stimuli, with few or many stimuli within each range. Only range affected both AL and the location of maximal responding. These results strongly support an AL interpretation of the "central tendency effect" in stimulus generalization.—*Journal abstract.*

4468. Ullrich, James R. & Balogh, Bela A. (U Montana) **Imagery and meaningfulness of right and wrong items in verbal discrimination learning.** *Psychonomic Science*, 1972(Oct), Vol 29(2), 68-70.—In a study with 144 Ss, the effects of variations in the rated imagery and the meaningfulness of the right word and the wrong word on a verbal discrimination task were examined by factorial manipulations of the imagery and meaningfulness values of the right and wrong words within verbal discrimination pairs. Results indicate that imagery was a more potent variable than meaningfulness in the verbal discrimination task.—*Journal abstract.*

4469. Wade, Edward A. & Biler, Michael J. (U Maine, Orono) **Learning and retention of verbal lists: Serial anticipation and serial discrimination.** *Journal of Experimental Psychology*, 1974(Oct), Vol 103(4), 732-739.—Compared serial anticipation and serial discrimination learning in 3 experiments with a total of 232 undergraduates. The Ss mastered consonant-vowel-consonant (CVC) lists when each item appeared in a triad with either task relevant or task irrelevant distractors, the former being items from other list positions and the latter CVCs from outside the list. Recognition or serial recall immediately followed list mastery. Knowledge of results was manipulated for discrimination groups. Trials, errors, total learning times, serial position errors, and retention were examined. The distractor variable was a potent determiner of performance, and knowledge of results variations had little, if any, effect. Learning and serial recall for anticipation groups were unaffected by type of distractor used in triads, but distractor type did affect the performance of discrimination groups.—*Journal abstract.*

4470. Williams, Brian R. (Oregon State U) **Comment on Levine's blank trial method: A procedure for estimating true hypothesis behavior.** *Journal of Experimental Child Psychology*, 1974(Oct), Vol 18(2), 362-368.—When M. Levine's 1966 method of blank trial probes

is used to study hypothesis behavior the probability that a probe results in a cue-defined choice combination usually lies between .70 and .90, depending upon the age group and the treatment conditions. It may not be safe to assume that each such combination signifies an hypothesis. A procedure for estimating the probability of true hypothesis behavior is presented, including a validity test for the resulting estimate.

4471. Włodarski, Ziemowit. (U Warsaw, Inst of Psychology, Poland) **Degree of material organization and learning effects.** *Polish Psychological Bulletin*, 1974, Vol 5(2), 67-71.—Investigated the causal relationship between the learning process and degree of material organization. 16 words referring to objects of 4 categories (fruits, animals, furniture, and vehicles) were exposed in 3 patterns with different numbers of transitions from 1 category to another (15 in the case of totally unorganized material, 9 for partially organized, and 3 for totally organized material). Ss were 120 Polish 5th and 6th graders. Results show that learning effects depended clearly on degree of material organization. Rapidity of learning rose commensurately with degree of organization. Contributing to the latter were 2 kinds of organization, that independent of the learner and that acquired as a result of the learner's own activity.—*Journal abstract*.

4472. Wright, Peter. (Stanford U, Graduate School of Business) **The harassed decision maker: Time pressures, distractions, and the use of evidence.** *Journal of Applied Psychology*, 1974(Oct), Vol 59(5), 555-561.—Investigated dominant simplifying strategies people use in adapting to different information processing environments. It was hypothesized that judges operating under either time pressure or distraction would systematically place greater weight on negative evidence than would their counterparts under less strainful conditions. 6 groups of male undergraduates ( $N = 210$ ) were presented 5 pieces of information to assimilate in evaluating cars as purchase options. 3 groups operated under varying time pressure conditions, while 3 groups operated under varying levels of distraction. Data usage models assuming disproportionately heavy weighting of negative evidence provided best fits to a significantly higher number of Ss in the high time pressure and moderate distraction conditions. Ss attended to fewer data dimensions in these conditions.—*Journal abstract*.

#### Attention & Memory

4473. Arik, Judith P. & Siegel, Alexander W. (U Pittsburgh) **Facilitation of sequential short-term memory with pictorial stimuli.** *Journal of Experimental Psychology*, 1974(Sep), Vol 103(3), 567-573.—Conducted 3 experiments which tested undergraduates ( $N = 48$ ) in a serial position recall task. Exp I found that pictures produced better performance than did spoken words; recall for pictures showed only a primacy effect, whereas recall for spoken words showed both a primacy and recency effect. In Exp II, visual words were the stimuli. Although words produced poorer overall performance than pictures, the shapes of the serial position curves were nearly identical (primacy but no recency). In Exp III, Ss were tested with visual and auditory words and were instructed to form images of the stimuli. Imagery instructions facilitated performance with auditory words

and inhibited performance with visual words. Results support a dual-encoding notion for visual stimuli (18 ref)—*Journal abstract*.

4474. Atkinson, Richard C. & Juola, Jaume F. (Stanford U) **Search and decision processes in recognition memory.** In D. H. Krantz, R. C. Atkinson, R. D. Luce & P. Suppes (Eds), *Contemporary developments in mathematical psychology. I. Learning, memory and thinking*. San Francisco, CA: W. H. Freeman, 1974, xiii, 299 p. \$9.—Reviews the general theory of memory as a dynamic and interactive system, develops and evaluates a mathematical model for recognition memory, and applies the model to relevant experiments: memory for items in short-term store, memory involving both long- and short-term target sets, and effects of target-list length and tests repetitions. (3 p ref)

4475. Bach, Mary J. (Northwestern U, Medical School, Chicago) **Implicit response frequency and recognition memory over time.** *Journal of Experimental Psychology*, 1974(Oct), Vol 103(4), 675-679.—Presented 150 words to 128 university students for study, followed by a 2-choice recognition test. The list was constructed so that implicit associative responses (IARs) to the words during study might both facilitate recognition (by increasing the frequency of the correct word in a test pair) and inhibit recognition performance (by increasing the frequency of the incorrect word in a test pair). The experiment was designed as a direct test of the hypothesis that the word frequency effect in recognition is due to such positive and negative effects. 4 retention intervals (0, 5, 10, and 15 min) were used to determine whether passage of time influenced the presumed IAR-frequency relationship. Results support the theoretical expectations after all retention intervals. Recognition performance showed no consistent change over 15 min.—*Journal abstract*.

4476. Banks, William P. & Atkinson, Richard C. (Pomona Coll) **Accuracy and speed strategies in scanning active memory.** *Memory & Cognition*, 1974(Oct), Vol 2(4), 629-636.—Used 2 conditions of familiarity of material and 2 conditions of payoff in a short-term memory scanning task with 20 paid undergraduates. Memory sets and probes were either drawn from a small, well-learned pool of words (the familiar set) or were sampled without replacement from a very large pool of words (the infinite set). Under both payoffs the infinite memory sets were searched at a faster rate than the familiar sets. The speed payoff reduced the constant component of latencies and, contrary to previous findings, increased the rate of memory search for both sets. Errors increased from about 1% with accuracy payoff to 19% with speed payoff. Under speed payoff most of the errors were false positives for the familiar set and false negatives for the infinite set. Several models of the task are considered, but none prove entirely satisfactory. (15 ref)—*Journal abstract*.

4477. Bennett, Raymond W. & Bennett, Inge F. (U Illinois, Chicago Circle) **PI release as a function of the number of pre-release trials.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Oct), Vol 13(5), 573-584.—In Exp I the magnitude of proactive interference (PI) was examined as a function of the number of trials prior to a category shift employed with 768 undergraduates. Using

the sense-impression dimensions of "round" and "white," the magnitude of release increased from about 6% after 1 prior trial to about 60% after 4 trials. A possible explanation of this effect is discussed. Exp II with 96 Ss explored some implications of the proposed model. The nature of the relationship between the magnitude of PI release and the contents of the memory trace is discussed, and it is argued that until more is known about the operation of the memory system, it will not be possible to use PI-release data as a source of evidence for the manner in which words are encoded. (24 ref)—*Journal abstract*.

4478. Bird, Charles P. & Goodwin, C. James. (Florida State U) **Form class as an effective encoding dimension in short-term memory.** *Journal of Experimental Psychology*, 1974(Oct), Vol 103(4), 625-628.—Conducted 2 experiments with a total of 144 undergraduate Ss using D. D. Wickens's (1972) procedure for the study of relevant encoding dimensions in short-term memory. In Exp I reliable release from proactive inhibition was obtained by changing the content of word triads on Trial 4 from nouns to verbs or vice versa. This effect was most clearly apparent when salience of the form class dimension was increased by informing Ss as to the content of each triad prior to its presentation. Exp II demonstrated that the results of Exp I were most likely due to differential encoding on the part of Ss, rather than to perceptual alerting caused by the introduction of the cue regarding change in form class.—*Journal abstract*.

4479. Bower, Gordon H. & Karlin, Martin B. (Stanford U) **Depth of processing pictures of faces and recognition memory.** *Journal of Experimental Psychology*, 1974(Oct), Vol 103(4), 751-757.—Conducted 3 experiments, with 12 undergraduate Ss in each, to determine whether S remembers a picture better the greater the "depth of processing" he allots to it. In Exps I and II depth of processing pictures of faces was varied according to judgments of sex (superficial) or judgments of likableness or honesty of the person pictured. Performance on a later recognition memory test was high for pictures judged for likableness or honesty and low for pictures judged for sex. This ordering held as true for intentional learners as for incidental learners. Exp III showed that face recognition memory was not materially affected by a context manipulation: an old test picture was remembered at a level determined by its original depth of processing and independently of how it was tested—either alone, along side an old picture it had been studied with, or with a new picture.—*Journal abstract*.

4480. Briggs, Raymond. (Oakland U) **Auditory and visual confusions: Evidence against simple modality encoding hypotheses.** *Memory & Cognition*, 1974(Oct), Vol 2(4), 607-612.—Using both recognition and recall responses, confusion and intrusion errors were obtained for briefly exposed 11-letter strings. The patterns of errors were sharply dependent upon experimental variables. In Exp I 47 college students made auditory and visual intrusions with recall, but neither with recognition. In Exp II increasing exposure time and eliminating a poststimulus cue presented to 26 Ss primarily increased auditory confusions. This suggests that auditory and visual confusions reflect strategy-contingent recoding

rather than modality-specific encoding.—*Journal abstract*.

4481. Cheng, Chao-Ming. (National Taiwan U, Taipei, Republic of China) **Different roles of acoustic and articulatory information in short-term memory.** *Journal of Experimental Psychology*, 1974(Oct), Vol 103(4), 614-618.—32 undergraduates attempted ordered recall of strings of 7 consonants: F, G, K, M, R, V, and Y. Each consonant is intrinsically correlated with a distinctive vowel phoneme when named as a letter. The experiment investigated whether suppressing these correlated vowel phonemes of the consonants by pairing each consonant with the redundant vowel /a/ would have the same effect on recall in the 2 input modes—auditory and articulatory. It was found that suppressing the vowel phonemes through the auditory mode had a selective interference effect on the recall of late items, whereas that through articulation had a nonselective effect across the whole list. A 3-component model of short-term memory is discussed based on these findings.—*Journal abstract*.

4482. Feeney, Dennis M.; Pittman, James C. & Wagner, H. Ryan. (U New Mexico) **Lateral inhibition and attention: Comments on the neuropsychological theory of Walley and Weiden.** *Psychological Review*, 1974(Nov), Vol 81(6), 536-539.—Criticizes the physiological assumptions of the recent theory of attention proposed by R. E. Walley and T. D. Weiden (see PA, Vol 51:6479). Their position, a pyramid of feature detectors with perception at the apex in association cortex, cannot account for much old and new data on brain function. The role they propose for lateral inhibition in attention is "cognitive masking"—the prevention of simultaneous encoding of perceptual events. Even given their assumptions, lateral inhibition cannot account for selective responding but rather is a consequence of selective processes. An alternative hypothesis for the role of lateral inhibition in attention is outlined. (25 ref)—*Journal abstract*.

4483. Fessler, Paul K.; Lenorovitz, David R. & Yoblick, Darryl A. (State U New York, Buffalo) **Time delay and similarity effects in facial recognition.** *Journal of Applied Psychology*, 1974(Aug), Vol 59(4), 490-496.—Conducted 4 experiments to investigate the ability to 232 undergraduates to recognize a target person, whom they had previously seen in slides or a film, in a test series of pictures. Exp I, which manipulated time delay between seeing the target and starting the test series (from 4 min to 1 wk), demonstrated that delay had no effect on recognition performance. The other 3 studies manipulated similarity between the target person and the decoy pictures preceding the target in the search series. The greater the target-decoy similarity, the poorer the recognition performance. A significant Target Position  $\times$  Similarity interaction indicated the presence of a larger performance decrement due to position when similarity level was high.—*Journal abstract*.

4484. Flexser, Arthur J. & Bower, Gordon H. (Stanford U) **How frequency affects recency judgments: A model for recency discrimination.** *Journal of Experimental Psychology*, 1974(Oct), Vol 103(4), 706-716.—Previous evidence that repetition of an item in a list enhances that item's recency relative to other items has

been interpreted as favoring a memory strength theory of recency discrimination. However, serious doubt has been cast upon the validity of the strength theory by experiments such as that of D. L. Hintzman and R. A. Block (see PA, Vol 46:6136) which instead favor a multitrace representation for repetitions of an item. The present 2 experiments, with a total of 80 16-31 yr old Ss, tested 2 plausible interpretations of the effect of frequency on relative recency judgments. The 1st, that low frequencies result in poor recognition memory, hence poorer recency discrimination, was discounted in Exp I, which still found sizable frequency effects on relative recency judgments even when considering only recognized items. A multiple-trace theory of contextual time tagging was then proposed to account for the effects of event frequency on subjective recency. Exp II, which collected event frequency as well as relative recency judgments, yielded data which were fit quantitatively by the multiple-trace time tagging theory. It was found that relative "distance" judgments were not psychologically symmetric to relative recency judgments—a result not predicted by the time tagging model.—*Journal abstract.*

4485. Friedrich, Douglas. (Central Michigan U) **Comparison of intrusion errors and serial position curves on monaural and dichotic listening tasks: A developmental analysis.** *Memory & Cognition*, 1974(Oct), Vol 2(4), 721-726.—Based on a repeated measurement study of 7-, 10-, 14-, and 17-yr-old students ( $n = 20$  in each group) with monaural and dichotic presentations of word lists varying in associative structure and presentation rate, intrusion and serial position dependent variables were analyzed. Intrusion analyses supported previous reports on word list recall; 7- and 10-yr-olds recalled fewer words from monaural and dichotic lists and had more intrusive errors than adolescents. Based on similar orders of report (strategies) for monaural and dichotic word presentations, serial position curves for the 2 types of presentation were compared. Within-age comparisons were strikingly similar. Between-age comparisons of monaural and dichotic presentation serial position curves support the notion that there are ontogenetic limitations in memory structure and control processes.—*Journal abstract.*

4486. Fritzen, James. (Virginia Polytechnic Inst & State U) **Unitization of related words in short-term store.** *Journal of Experimental Psychology*, 1974(Oct), Vol 103(4), 638-645.—Conducted 4 experiments with a total of 353 undergraduate Ss to assess the extent to which Ss unitize related words in short-term storage (STS). Categorized words were inserted either at the end (Exps I, II, and IV) or toward the middle (Exp III) of lists of unrelated words. The unitization of the related words in STS was expected to facilitate the recall of other words in the list. No facilitation was found in Exp I in which Ss were free to recall the words in any order. When recall was constrained, there was facilitation of other words either prior (Exps II and IV) or subsequent to (Exp III) the related words. Results are taken as evidence that unitization does take place in STS.—*Journal abstract.*

4487. Fuchs, Alfred H. & Melton, Arthur W. (Bowdoin Coll) **Effects of frequency of presentation and stimulus length on retention in the Brown-Peterson paradigm.** *Journal of Experimental Psychology*, 1974(Oct), Vol

103(4), 629-637.—In an experiment with 48 female university students, percent recall from word units decreased in the Brown-Peterson short-term memory paradigm as a function of unit length (3 vs 5 words) and retention interval (0, 4, 8, or 16 sec) and increased as a function of the frequency of massed presentations (1, 2, 3, or 4). The absolute recall of words was less from 5-word than from 3-word units at the longer retention intervals following 1 or 2 presentations. Results confirm the presence of intraunit interference in recall after 4 or more sec under conditions of high intraexperimental proactive interference, even though there is other evidence that intraunit interference in recall over intervals up to 4 sec may be attributable to probability of displacement from a limited-capacity primary memory or rehearsal system. (15 ref)—*Journal abstract.*

4488. Geiselman, Ralph E. (Ohio U) **Positive forgetting of sentence material.** *Memory & Cognition*, 1974(Oct), Vol 2(4), 677-682.—Presented sets of sentences to 120 undergraduates with each sentence being cued "remember" or "forget" immediately following its presentation. Results show that to-be-remembered (TBR) sentences were more accessible than to-be-forgotten (TBF) sentences and uncued control sentences. Sentence connectedness was an important determiner of the magnitude of the observed recall phenomenon. Using a multiple-choice recognition test, key words or phrases from the to-be-forgotten sentences were equally available as key words or phrases from the to-be-remembered sentences. Results extend the selective-rehearsal and differential-grouping interpretation of the positive-forgetting phenomenon to encompass sentence material. (17 ref)—*Journal abstract.*

4489. Griggs, Richard A. (U Florida) **The recall of linguistic ideas.** *Journal of Experimental Psychology*, 1974(Oct), Vol 103(4), 807-809.—Used J. D. Bransford and J. J. Franks's (see PA, Vol 48:4191) procedure for studying the abstraction of linguistic ideas in a sentence memory task but with a recall test substituted for the usual recognition test. Following the recall test, the 10 undergraduate Ss were asked to produce the complex ideas that could be created from the sets of related acquisition sentences. Results of both tests support Bransford and Franks's argument for the construction of more "wholistic semantic structures."—*Journal abstract.*

4490. Harris, Richard J. (U Kansas) **Memory for presuppositions and implications: A case study of 12 verbs of motion and inception-termination.** *Journal of Experimental Psychology*, 1974(Sep), Vol 103(3), 594-597.—Gave 48 university undergraduates 12 sentences, in each of which the verb carried presuppositions or implications about what happened before or after the action of the sentence (e.g., "At 6:00 the bullfighter entered the arena."). Ss were then tested on their ability to comprehend or remember related information (e.g., where the bullfighter was just before or after 6:00). Although linguistic predictions were confirmed for sentences with affirmative verbs, such sentences with negative verbs were apparently presuppositionally and implicationally ambiguous. There was no difference between presuppositions and implications in either comprehension or memory.—*Journal abstract.*

4491. **Hollan, James D.** (Clarkson Coll of Technology) **Some effects of epistemological structure on memory.** *Memory & Cognition*, 1974(Oct), Vol 2(4), 670-676.—Tested graph theoretical models of the epistemological structure imposed upon a set of mathematical concepts by 10 graduate mathematics students and faculty in 3 recall experiments. Exp I showed that recall and confidence of recall were highest for concept pairs connected by short paths, next highest for those connected by long paths, and lowest for those not connected by paths. Exp II replicated the result of Exp I that recall and confidence of recall were greater for concept pairs connected by paths than for those not connected by paths and revealed no differences in recall between concept pairs connected by many paths and those connected by a few paths. Exp III found no differences in recall of abstract and concrete concepts. The abstractness of a concept was quantified by the mean path length from the concept to primitive (undefined) concepts. The approach of building a model of each S's epistemological structure is supported by the finding that, while a given S's definitions of the concepts remained relatively constant, there were considerable differences in definitions of the concepts between Ss.—*Journal abstract.*

4492. **Hudson, Robert L. & Davis, Jerry L.** (Mississippi State U) **The effects of intralist cues, extralist cues, and category names on categorized recall.** *Psychonomic Science*, 1972(Oct), Vol 29(2), 71-75.—Reports 2 experiments which attempted to clarify a procedural problem in a previous study by R. L. Hudson and J. B. Austin (see PA, Vol 45:3478) and to provide support for the hypothesis that context words as recall cues serve to mediate category names. Ss were a total of 148 undergraduates. The results regarding the procedural problem of Hudson and Austin indicate that exposure to context words during recall trials did not artifactually increase recall for context groups. The hypothesis that context cues serve to mediate the category name was supported in Exp II but not in Exp I.—*Journal abstract.*

4493. **Jacoby, Larry L.** (Iowa State U) **The role of mental contiguity in memory: Registration and retrieval effects.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Oct), Vol 13(5), 483-496.—Implicit contiguity of related items whose list presentations are physically disparate results from the S looking back through memory so as to bring the items together in mental experience. Effects of implicit contiguity were examined in 3 experiments with a total of 170 undergraduate Ss by controlling looking-back behavior during list presentation and varying the separation of target items and related items that were later provided as recall cues. The effectiveness of semantic cues was enhanced by their implicit contiguity with target items during study. However, Exp III showed that the effectiveness of acoustically related cues was uninfluenced by either physical or implicit contiguity. Exp III also revealed that finding faster "decay" of acoustic than semantic information is dependent upon retention test arrangements. (19 ref)—*Journal abstract.*

4494. **Johansson, Bo S.; Lindberg, Leif G. & Svensson, Margareta L.** (Uppsala, Sweden) **Effects of encoding strategy, presentation modality, and scoring method on**

**STM performance with the Peterson and Peterson technique.** *Memory & Cognition*, 1974(Oct), Vol 2(4), 656-662.—Replicated L. R. Peterson and M. J. Peterson's (see PA, Vol 34:5499) experiment, using a variation of presentation modality and encoding strategy in 2 experiments with a total of 96 psychology students. The recall data showed that a Peterson and Peterson type forgetting curve was obtained using auditory presentation and instructions to rehearse vocally the trigrams when scoring only completely correct recall within the 1st 3 sec of the recall interval. With visual presentation and instructions to find meaningful trigram interpretations, the forgetting curve was higher and much more flat, especially when scoring position-correct recall within the total 0-10-sec recall interval. No buildup of proactive inhibition could be detected when visual presentation was used together with instructions to find meaningful trigram interpretations. The importance of the different encoding activities for recall performance is discussed. (23 ref)—*Journal abstract.*

4495. **Jones, Sheila.** (University Coll London, England) **Imagery in a short-term memory task.** *Psychonomic Science*, 1972(Oct), Vol 29(2), 76-78.—Instructions for 2 short-term memory spatial tasks involving paired-associate (PA) learning were presented to 48 undergraduates under conditions which either suppressed or permitted the use of imagery mediation. Differential performance of the tasks for the 2 presentation conditions was found to be related to the imagery concreteness of the response members of the PAs when high-imagery stimulus members were used as nonverbal cues in recall. The prediction that imagery would be used spontaneously and effectively when conditions favored its use was confirmed. Results also indicate that the mode of presentation of an instruction sentence (written vs spoken) may be an important variable in subsequent performance of a short-term memory task.—*Journal abstract.*

4496. **Kantowitz, Barry H.** (Purdue U) **Modality effects in recognition short-term motor memory.** *Journal of Experimental Psychology*, 1974(Sep), Vol 103(3), 522-529.—Evaluated short-term motor memory (STMM) in a same-different recognition task with male undergraduates. Such a recognition measure offers methodological advantages over production measures of retention. In Exp I, with 8 Ss, an immediate recognition task was used to validate an index of recognition difficulty. In Exp II, with 48 Ss, delays of 0 sec, 20 sec unfilled, and 20 sec filled with paced tapping were used. A complex interaction among type of different trial, delay condition, and modality suggests that systematic changes in visual STMM are produced by activity, while changes in kinesthetic STMM are produced by delay and not by activity. However, an interaction between type of recognition trial and modality was independent of delay condition, suggesting that modality effects in the STMM paradigm cannot be attributed entirely to memory decrements. (15 ref)—*Journal abstract.*

4497. **Lefton, Lester A. & Spragins, Anne B.** (U South Carolina) **Orthographic structure and reading experience affect the transfer from iconic to short-term memory.** *Journal of Experimental Psychology*, 1974(Oct), Vol 103(4), 775-781.—A total of 42 undergraduates and

126 1st, 3rd, and 5th graders were shown 8-item pseudowords of either 1st- or 4th-order approximation to English. Processing time was controlled with a visual noise mask, and either the entire array was masked or just the left- or the right-hand side. Results show that (a) processing of letter strings proceeded sequentially from left to right, (b) it proceeded more rapidly for orthographically constrained strings of letters than random strings of letters, and (c) it developed during the early school years with changes in processing strategy essentially complete by about the 3rd or 4th grade.—*Journal abstract*.

4498. Loftus, Elizabeth F. & Palmer, John C. (U Washington) **Reconstruction of automobile destruction: An example of the interaction between language and memory.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Oct), Vol 13(5), 585-589.—Conducted 2 experiments in which a total of 195 students viewed films of automobile accidents and then answered questions about events occurring in the films. The question, "About how fast were the cars going when they smashed into each other?" elicited higher estimates of speed than questions which used the verbs *collided*, *bumped*, *contacted*, or *hit* in place of *smashed*. On a retest 1 wk later, those Ss who received the verb *smashed* were more likely to say "yes" to the question, "Did you see any broken glass?", even though broken glass was not present in the film. Results are consistent with the view that the questions asked subsequent to an event can cause a reconstruction in one's memory of that event.—*Journal abstract*.

4499. Madigan, Stephen. (U Southern California) **Cue-dependent effects in recall of categorized lists.** *Memory & Cognition*, 1974(Oct), Vol 2(4), 700-702.—Similarities between cued and noncued recall suggest that both measure the same underlying processes. Differences suggest the utility of cueing procedures in identifying the origin of characteristics of recall—any feature of noncued recall that is altered by provision of cues must originate in the retrieval process; features resistant to such modification represent encoding or storage effects.

4500. Mandler, George & Boeck, Wayne J. (U California, San Diego) **Retrieval processes in recognition.** *Memory & Cognition*, 1974(Oct), Vol 2(4), 613-615.—Retrieval processes in the long-term recognition of well organized material showed the expected organizational effects on "slow" recognition responses. 21 Ss sorted 100 words into 2-7 categories until a stable organization was achieved. Data show the usual correlations between organization (number of categories used) and recall and recognition. Recognition tests a week after the sorting task revealed no differences between Ss using many or few categories for the "fast" recognition responses, defined as the faster 50% of each S's latency distribution. The organizational effect was clearly evident for the "slow" 50% of the responses. Data support the retrieval-check hypothesis in recognition under the assumption that retrieval operations take additional time during the recognition process.—*Journal abstract*.

4501. Mewhort, D. J. (Queen's U, Kingston, Ontario, Canada) **Accuracy and order of report in tachistoscopic identification.** *Canadian Journal of Psychology*, 1974(Sep), Vol 28(3), 383-398.—Presents a 2-process

model which considers both encoding and rehearsal processes in a free-recall tachistoscopic identification task. It is suggested that the transfer of material from iconic storage to verbal short-term memory involves a rapid left-to-right operation (scanning) which proceeds more rapidly when dealing with familiar letter patterns. The scan loads short-term memory by converting the parallel spatial array held in the icon to a sequential one in preparation for response organization within short-term memory. Organization within short-term memory involves a relatively slow and iterative rehearsal loop established in terms of the temporal organization resulting from the scan. An experiment with 32 undergraduates is reported which illustrates some implications of the model. In particular, the experiment shows the separate contribution of scanning and rehearsal to the organization of a sequential response. It also shows that although both mechanisms exploit the structure of familiar letter patterns, they do so independently. (French summary) (27 ref)—*Journal abstract*.

4502. Monty, Richard A.; Karsh, Robert & Taub, Harvey A. (US Army Human Engineering Lab, Behavioral Research Directorate, Aberdeen Proving Ground, MD) **The effect of set on encoding and rehearsal processes in memory.** *Memory & Cognition*, 1974(Oct), Vol 2(4), 691-694.—Determined the effect of manipulating each of 120 college student S's preparation for what he will see on a given trial on his ability to mentally keep track of the number of occurrences of each of several different stimuli in a sequence. It was found that, when the same stimuli were used from trial to trial, performance was significantly better than when different stimuli were used. Foreknowledge of the specific stimuli to be used on a given trial did little to improve performance per se, but it did reduce labeling errors. Results are discussed in terms of the "spatial window" model of keeping-track performance.—*Journal abstract*.

4503. Murdock, Bennet B. & Wells, J. Elisabeth. (U Toronto, Ontario, Canada) **Parameter invariance in short-term associative memory.** *Journal of Experimental Psychology*, 1974(Sep), Vol 103(3), 475-488.—Used a confidence-judgment recognition procedure, a forced-choice recognition procedure, and a cued-recall procedure to test 3 different models of short-term associative memory. Each of 8 undergraduates was given 640 tests on each procedure; presentation rate was also a within-Ss variable. The models tested were a cross-reference model based on independent forward and backward associations, an access-time model, and strength theory. The cross-reference model underpredicted recall, but was adequate for the recognition data. The access-time model could predict either type of recognition data separately but not together. Strength theory fared quite poorly. (28 ref)—*Journal abstract*.

4504. Nelson, Thomas O. & MacLeod, Colin M. (U Washington) **Fluctuations in recall across successive test trials.** *Memory & Cognition*, 1974(Oct), Vol 2(4), 687-690.—Investigated whether item fluctuation (inter-trial forgetting and spontaneous recovery) depends upon the time allowed for recall and/or the demand characteristics of the experimental situation (manipulated via instructions to S). 144 undergraduates studied a 36-item list and then had 2 successive recall trials which were 9,

36, or 144 sec in duration. On the 2nd recall trial, Ss were instructed to recall previously recalled items only ("old"), previously nonrecalled items only ("new"), or both previously recalled items and previously nonrecalled items ("both"). Results suggest that (a) although recall trial duration affected the overall amount of recall, it did not affect the amount of item fluctuation and (b) instruction to recall only "old" items or to recall only "new" items resulted in suppression of the nonrequested items without a corresponding facilitation for the requested items.—*Journal abstract.*

4505. **Ninio, Anat & Kahneman, Daniel.** (Hebrew U, Jerusalem, Israel) **Reaction time in focused and in divided attention.** *Journal of Experimental Psychology*, 1974(Sep), Vol 103(3), 394-399.—Undergraduates listened to dichotic lists of words and responded to animal names by pressing a key. Group 1 (36 Ss) performed in a condition of focused attention to one of the messages and in a condition of divided attention, where both messages were relevant. Group 2 (8 Ss) performed in focused attention and in a single-message condition. It was found that there were many more omissions in divided than in focused attention, and mean reaction time (RT) was prolonged. There was no difference in RT between focused attention and the single-message condition. The occurrence of an animal name in the irrelevant message occasionally caused errors. Results are consistent with an effort theory of attention. (18 ref) —*Journal abstract.*

4506. **Norman, M. Frank.** (U Pennsylvania) **Effects of overtraining, problem shifts, and probabilistic reinforcement in discrimination learning: Predictions of an attentional model.** In D. H. Krantz, R. C. Atkinson, R. D. Luce & P. Suppes (Eds), *Contemporary developments in mathematical psychology: I. Learning, memory and thinking*. San Francisco, CA: W. H. Freeman, 1974. xiii, 299 p. \$9.—Develops a model for discrimination learning which was proposed by D. Zeaman and B. J. House (1963) and by E. Lovejoy (1968). Called the ZHL model, the formulations incorporate interacting perceptual- and response-learning processes and are illustrated within the context of several experiments. (16 ref)

4507. **Paivio, Allan.** (U Western Ontario, London, Canada) **Spacing of repetitions in the incidental and intentional free recall of pictures and words.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Oct), Vol 13(5), 497-511.—Lists containing repeated pictures (PP), repeated words (WW), pictures repeated as words or vice versa (PW), and unpeated items were recalled following incidental, intentional control, or standard free recall instructions presented to a total of 378 undergraduates in 2 experiments. Theoretical interest centered on the effects of spacing of repetitions and the degree to which the repeated events are additive (statistically independent) under different conditions. Results show that (a) spacing enhanced recall for all types of repetitions under standard instructions, but only PP repetitions benefitted from spacing under incidental conditions; (b) under standard conditions, PP and WW repetitions were less than additive when massed but became additive when spaced, whereas PW repetitions were at least additive whether massed or spaced; and (c) most repeated events displayed independence under incidental conditions.

Results indicate differential encoding and attentional processes in the lag effect, and dual coding in picture-word memory. (20 ref)—*Journal abstract.*

4508. **Pellegrino, James W. & Battig, William F.** (U Colorado, Inst for the Study of Intellectual Behavior) **Effects of semantic list structure differences in free recall.** *Psychonomic Science*, 1972(Oct), Vol 29(2), 65-67.—Results of a study with 37 undergraduates show that free-recall learning of a mixed list of 20 related and 20 unrelated words was enhanced more if the related words belonged to common taxonomic categories than if they were hierarchically ordered as a single branch of a "semantic tree" (e.g., *animal, mammal, dog, terrier*). The same difference obtained in 1-wk delayed recall. No significant taxonomic-hierarchic differences were found in clustering. More detailed analyses indicated the hierarchical recall decrement to reflect fewer recalled items per set during learning, but fewer sets represented in delayed recall. These results are interpreted on the basis of a 2-stage retrieval process, distinguishing access to a semantic set from subsequent access to items within the set.—*Journal abstract.*

4509. **Pick, Anne D.; Pick, Herbert L. & Hales, Jacqueline J.** (U Minnesota) **Selective attention to words and colors.** *Psychonomic Science*, 1972(Oct), Vol 29(2), 85-87.—27 undergraduates made same-different judgments for pairs of words that were either color names or object names. The words of a pair were printed in either matching or different color print. Responses were directed to the print color, to the words, or to both. Both print color and color names lengthened response time in several experimental conditions. It is hypothesized that only the information necessary for judgments is processed initially; the words are read, and interference is produced only after color and/or letter-shape differences have been detected.—*Journal abstract.*

4510. **Postman, Leo & Burns, Sheila.** (U California, Berkeley) **Long-term retention as a function of word concreteness under conditions of free recall.** *Memory & Cognition*, 1974(Oct), Vol 2(4), 703-708.—Acquisition and long-term retention of concrete (C) and abstract (A) words by 128 university students were investigated under conditions of multiple-trial free recall. Both unmixed and mixed lists were used in original learning. Retention was tested either 1 min or 1 wk after attainment of the learning criterion. Acquisition was faster and retention was higher for C than for A words. These differences were more pronounced for mixed than for unmixed lists. (17 ref)—*Journal abstract.*

4511. **Raeburn, Vicki P.** (Vassar Coll) **Priorities in item recognition.** *Memory & Cognition*, 1974(Oct), Vol 2(4), 663-669.—Used S. Sternberg's (see PA, Vol 40:10810) paradigm to examine item recognition in 2 experiments with a total of 18 university students. Functions relating reaction time to positive set size and relating reaction time to the serial position of positive targets are discussed within the context of Sternberg's (1969) recognition model. It was hypothesized that (a) certain members of the positive set receive preferential processing and (b) some members of the negative set are compared to the target in memory. Results of both experiments support the 1st hypothesis, and results of Exp I support the 2nd hypothesis.—*Journal abstract.*

4512. Robbins, Donald & Bray, James F. (Emory U) **The spacing effect and the A-B, A-C paradigm: Evidence for retroactive facilitation.** *Journal of Experimental Psychology*, 1974(Sep), Vol 103(3), 420-425.—Varied (a) the retention interval in a continuous paired-associate task after 1 or 2 presentations of a pair of words, and (b) the lag between the 2 presentations. Half of the twice-presented items represented an A-B, A-C negative transfer design, while the other half were A-B, A-B items. 3 groups of undergraduate Ss ( $N = 60$ ) were instructed, with regard to the A-B, A-C items, to recall on test trials either Response B, C, or both B and C. The results from the A-B, A-C items revealed that Ss asked to recall both B and C performed at the same level as Ss required to recall only B or only C. In addition, under some conditions evidence of retroactive facilitation was found. Specifically, under these conditions the presentation of A-C was as effective as a 2nd presentation of A-B for the recall of B for a relatively long retention interval. It is concluded that current memory models must be modified to account for retroactive facilitation.—*Journal abstract.*

4513. Runquist, Willard N. (U Alberta, Edmonton, Canada) **Formal and semantic similarity of stimuli and recall time.** *Psychonomic Science*, 1972(Oct), Vol 29(2), 79-80.—Gave to 144 undergraduates 7 study-test trials on paired-associate lists varying in intralist stimulus similarity. Stimuli rhymed, were from the same conceptual category, or were dissimilar. Study time was constant at 2 sec/item, but time allowed for recall on paced test trials was either 1 or 3 sec. At the faster rate, the formally similar stimuli produced more interference than did the semantically similar stimuli. There was also some evidence that semantic similarity did not produce much interference early in learning. At the slower rates, the 2 high-similarity conditions produced substantial but equal amounts of interference. Results are consistent with a sequential coding hypothesis.—*Journal abstract.*

4514. Salthouse, Timothy A. (U Michigan, Human Performance Ctr) **Using selective interference to investigate spatial memory representations.** *Memory & Cognition*, 1974(Oct), Vol 2(4), 749-757.—Conducted 2 experiments with 36 undergraduates and 48 paid Ss, respectively, in which a selective interference procedure was used to determine whether nonverbal visual stimuli were represented in memory in a verbal or spatial format. In both experiments, Ss were required to remember either the positions or the identities of 7 target items in a 25-item array. During the retention interval for that information, Ss attempted to recognize schematic face or airplane photograph stimuli in a same-different memory task. Memory performance on one or both tasks was greatly impaired when the recall task involved position or spatial information, but was either much less or not at all affected by an identity or verbal information recall task. Because of the selective nature of the interference and on the basis of certain correlational evidence, results are interpreted as providing support for the notion that verbal and spatial information are stored and processed in separate information-processing systems. (16 ref)—*Journal abstract.*

4515. Shiffrin, Richard M. & Schneider, Walter. (Indiana U) **An expectancy model for memory search.**

*Memory & Cognition*, 1974(Oct), Vol 2(4), 616-628.—Proposes a model for memory search in which S first forms an "expectancy" regarding the item to be tested on the next trial, then carries out a memory search. It is proposed that an expected item is encoded faster (or perhaps responded to more quickly), but the memory scanning process for expected and unexpected items is otherwise identical. Assuming a serial exhaustive scanning process, it was possible to fit much of the data in the literature. In addition, the model was tested by having each of 5 paid university students give his expectancy aloud before each trial. Data show about a 100-msec advantage for expected items that did not interact with memory load. The model fits this data reasonably well. (36 ref)—*Journal abstract.*

4516. Sullivan, Edith V. & Turvey, M. T. (U Connecticut) **On the short-term retention of serial, tactile stimuli.** *Memory & Cognition*, 1974(Oct), Vol 2(4), 600-606.—In 3 experiments using the short-term memory distractor paradigm, a total of 96 female undergraduates attempted to remember which 3 or 4 phalanges of the left hand had been stimulated and in what order. The experiments showed that forgetting increased as a function of trials, that such proactive effects could be eliminated by separating the successive trials by several minutes, that both verbal and nonverbal distractor tasks impaired retention, and that forgetting reached a maximum in approximately 6 sec. Results concur with those generally obtained for the short-term retention of verbal material. Tactile recall was significantly poorer after an arithmetic distractor task presented visually than after the same task presented aurally. This result suggests an overlap between the mechanisms of tactile retention and the mechanisms of vision. (22 ref)—*Journal abstract.*

4517. Timmins, W. K. (Australian National U, Canberra, ACT) **Varying processing time in directed forgetting.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Oct), Vol 13(5), 539-544.—Presented 21 undergraduate Ss with trials consisting of 3 sets of 5 words each. Some of these trials included an instruction to forget one of the sets of words. Both recall of the to-be-remembered words and recognition of the to-be-forgotten words was directly related to the time during which the S had to maintain the words in memory. Results are seen as consistent with a view that, to be effective, a cue to forget must be presented before a certain minimal amount of processing has taken place.—*Journal abstract.*

4518. Walley, Roc E. & Weiden, Theodore D. (U Alberta, Edmonton, Canada) **Giving flesh to a "straw man": A reply to Feeney, Pittman, and Wagner.** *Psychological Review*, 1974(Nov), Vol 81(6), 540-542.—Replies to the recent attack by D. M. Feeney et al (see PA, Vol 53:Issue 3) on R. E. Walley and T. D. Weiden's 1973 neuropsychological theory of attention. It is argued that Feeney et al used "straw man" arguments based on misinterpretations of the theory. An attempt is made to show that the Walley and Weiden theory can account for the data discussed by Feeney et al, as well as additional data not cited by these authors.—*Journal abstract.*

4519. Weaver, George E. (Florida State U) **Effects of poststimulus study time on recognition of pictures.** *Journal of Experimental Psychology*, 1974(Oct), Vol 103(4), 799-801.—Complex color photographs served as

stimuli to 108 paid undergraduates in an investigation of visual recognition memory. Increases in both stimulus duration (1 or 3 sec) and in the unfilled (dark) interstimulus interval (2 or 6 sec) led to improved performance in a 2-alternative forced-choice recognition test. The superiority of recognition associated with increases in interstimulus interval duration suggests that, even for complex visual stimuli, poststimulus processing is important for subsequent retention.—*Journal abstract.*

4520. Wickelgren, Wayne A. (U Oregon) **Single-trace fragility theory of memory dynamics.** *Memory & Cognition*, 1974(Oct), Vol 2(4), 775-780.—Considers that, in single-trace fragility theory, forgetting is produced by 2 factors, time and interference. Memory traces are assumed to have 2 partially coupled dynamic properties, strength and fragility. Strength determines the probability of correct recall and recognition, while fragility determines the susceptibility of the trace to the time-decay process but not to the interference process. Consolidation is assumed to be a continual reduction in the fragility of the memory trace rather than any change in strength or availability. Decreasing fragility accounts for the continually decreasing forgetting rate, the temporal character of retrograde amnesia and recovery therefrom, and the type of internal clock necessary for nonassociative recency judgments. Data are presented to indicate that interference is independent of the interval between original and interpolated learning, that nonassociative recency discriminability approaches a limit at about 30 min, and that the decay rate of long-term retention in amnesic patients is the same as in normal Ss. (18 ref)—*Journal abstract.*

4521. Wickelgren, Wayne A. (U Oregon) **Strength/resistance theory of the dynamics of memory storage.** In D. H. Krantz, R. C. Atkinson, R. D. Luce & P. Suppes (Eds), *Contemporary developments in mathematical psychology: I. Learning, memory and thinking*. San Francisco, CA: W. H. Freeman, 1974. xiii, 299 p. \$9.—Attempts to characterize the dynamics of storage in memory from the end of the learning period to the time of retrieval. Assumptions relevant to the retrieval of memory traces in "yes-no" recognition, multiple-choice recognition, recall, and recency memory tasks are discussed, and phenomena in the dynamics of short- and long-term memory traces (e.g., exponential power decay, storage interference, and retrograde amnesia) are detailed. (48 ref)

4522. Wicker, Frank W. & Holley, Freda M. (U Texas, Austin) **Recognition ratings and imagery mediation with pictures and words.** *Psychonomic Science*, 1972(Oct), Vol 29(2), 120-122.—The effect of stimulus recognition ratings on immediately subsequent response recall in the test-trial of paired-associate learning was evaluated with picture and word stimuli in conjunction with 2 visual distracting tasks. Ss were 60 undergraduates. Recall was reduced by the recognition ratings, but this effect appeared independent of stimulus modality and of visual distraction. It is suggested that the recognition task may disrupt use of imagery mediation but that this disruption does not differ for pictures and words.—*Journal abstract.*

4523. Wolford, George & Hollingsworth, Samuel. (Dartmouth Coll) **Evidence that short-term memory is not the limiting factor in the tachistoscopic full-report**

**procedure.** *Memory & Cognition*, 1974(Oct), Vol 2(4), 796-800.—Conducted an experiment with 5 paid, normally seeing adult Ss to determine whether acoustic short-term memory is the factor which limits performance in the tachistoscopic full-report paradigm. Many Ss have demonstrated the existence of phonemic encoding in short-term memory. The confusion errors from a tachistoscopic full-report task were, therefore, analyzed for the presence of acoustic confusions. Absolutely no evidence for acoustic confusions was found; visual confusions, however, were abundant. It is concluded that acoustic short-term memory is not the limiting factor in the full-report paradigm. (16 ref)—*Journal abstract.*

4524. Yarmey, A. Daniel. (U Guelph, Ontario, Canada) **Proactive interference in short-term retention of human faces.** *Canadian Journal of Psychology*, 1974(Sep), Vol 28(3), 333-338.—Tested whether release from proactive interference occurs in short-term recognition memory following a shift in the learning of male faces to the learning of female faces, and vice versa. Ss were 52 female and 52 male college students. Proactive interference was found to increase over 4 successive study-test trials and a significant release effect was obtained on Trial 5. Female faces were more difficult to recognize than male faces after a build-up of proactive interference, suggesting that differential interference for sex attributes had occurred. No differences were found between male and female Ss in the release effect, but female Ss were superior to males on Trials 1-4. Results are discussed in terms of the influence of motivation on memory for faces as well as supporting a theory of visual short-term memory. (French summary) (18 ref)—*Journal abstract.*

4525. Yulle, John C. & Holyoak, Keith. (U British Columbia, Vancouver, Canada) **Verb imagery and noun phrase concreteness in the recognition and recall of sentences.** *Canadian Journal of Psychology*, 1974(Sep), Vol 28(3), 359-370.—Examined the role of verb imagery and noun phrase concreteness in determining sentence imagery and memory in 2 experiments with a total of 111 male and 17 female university students. Semantic changes in sentences were recognized more often if the noun phrases were concrete rather than abstract. Free recall of sentences was affected similarly by phrase concreteness. Verb imagery, however, had no effect on either recognition or recall performance. Analysis of recall by type of word indicated that organization of recall centered upon the nouns. Implications of these results for the hypothesis of imaginal coding of concrete sentence meaning are discussed. (French summary) (15 ref)—*Journal abstract.*

### Motivation & Emotion

4526. Boden, Margaret A. (U Sussex, England) **The structure of intentions.** *Journal for the Theory of Social Behaviour*, 1973(Apr), Vol 3(1), 23-46.—Describes the psychological nature of intentions. Each intention is viewed as having a motivational, a procedural, and a bodily operational aspect each of which has its own particular structure. Reasons for psychology's refusal to accept "intention" and other terms of everyday phenomenology as items proper to a scientific psychology are discussed. It is concluded that any satisfactory theory

concerning intentions must recognize and explain their inner structure, showing how it relates to the controlling function of intentions in thought and overt behavior. (28 ref)—R. S. Albin.

4527. Brame, John M. & Blick, Kenneth A. (U Richmond) **Absolute and relative bidirectional transfer in verbal conflict resolution tasks.** *Journal of Psychology*, 1974(Sep), Vol 88(1), 113-119.—In a study with a total of 82 undergraduates, 1 group of Ss resolved 10 double approach-avoidance (DAP-AV) verbal conflicts followed by 10 approach-approach (AP-AP) conflicts, and another group transferred from AP-AP to DAP-AV. 2 additional groups, which resolved 20 conflicts of the same type (AP-AP or DAP-AV), were used in assessing relative transfer effects. Results indicate longer resolution times associated with DAP-AV conflicts ( $p < .05$ ), but no absolute or relative transfer in either direction. Failure to demonstrate transfer effects may have resulted from interference in the production of a response set or from the failure of a specific response set to generalize to a new task.—*Journal abstract*.

4528. González de Chávez, Manuel. ("Francisco Franco" Provincial Sanitarium, Psychiatric Clinic, Madrid, Spain) [History of research on jealousy.] (Span) *Archivos de Neurobiología*, 1972(May), Vol 35(3), 205-224.—Discusses 3 stages in research on jealousy: (a) the study of jealousy as a normal or pathological emotion, (b) study of the jealous person, and (c) study of the social context of jealousy, i.e., the social factors which influence jealousy in the individual. (English & French summaries)

4529. Levine, Jerrold M.; Samet, Michael G. & Brahmek, Rae E. (American Inst for Research, Washington, DC) **Information seeking with input pacing and multiple decision opportunities.** *Human Factors*, 1974(Aug), Vol 16(4), 384-394.—48 paid male undergraduates performed a task in which they had to request updated enemy position reports from 3 information sources to determine which of 8 locations was the target of a gradual enemy advance. 8 different problems, presented twice each, were arranged into 2 factorial designs. In Design FP, the effects of pacing rate, pacing variability, and the number of decision modification opportunities were evaluated. In Design SP, information requests were self-paced rather than forced-paced; the effects of the number of decision modification opportunities and basis of payoff were studied. Results indicate that (a) self pacing and fast forced pacing resulted in more information seeking and greater accuracy than did slow forced pacing and (b) increased opportunities for decision modification generally decreased the accuracy of, and confidence in, 1st decisions. The rate at which information was presented was more important than whether it was provided automatically or upon request.—*Journal abstract*.

4530. May, Richard B. & Hutt, Corinne. (U Victoria, British Columbia, Canada) **Response to stimulus uncertainty in four-, six-, and eight-year-old children.** *Journal of Psychology*, 1974(Sep), Vol 88(1), 127-133.—Allowed 48 school children to play with a button-press light-display apparatus. 4-, 6-, and 8-yr-old groups all pressed more for high uncertainty (8 lights) than for low uncertainty (1 light), but the effect was most pronounced

for the youngest age group. 2 min of pretest sensory restriction for half the Ss had no reliable effect upon their button-pressing behavior. In addition, most Ss stated that they "liked best" the high uncertainty stimulus display. However, even those who verbalized other preferences still pressed more for the high uncertainty display, emphasizing the difficulty of comparing overt choices with verbally stated preferences.—*Journal abstract*.

4531. Zillman, Dolf; Hoyt, James L. & Day, Kenneth D. (Indiana U) **Strength and duration of the effect of aggressive, violent, and erotic communications on subsequent aggressive behavior.** *Communication Research*, 1974(Jul), Vol 1(3), 286-306.—Investigated the aggression-modifying, immediate effect on provoked individuals of exposure to a neutral, an aggressive, a violent, or an erotic communication. Ss were 60 male undergraduates. All communications were followed by a common, noninvolving, nonaggressive communication. Under these conditions, neither the effect of the aggressive or the violent communication differed from the effect of the neutral communication. In contrast, the effect of the erotic communication significantly exceeded the effects of all other communications, yielding more intense aggressiveness. Measures of excitatory changes were also obtained. The differentiation of these measures coincided with the differentiation of measured aggressiveness, thus lending support for the excitation-transfer paradigm. (18 ref)—*Journal abstract*.

4532. Zillmann, Dolf; Johnson, Rolland C. & Day, Kenneth D. (Indiana U, Inst for Communication Research) **Attribution of apparent arousal and proficiency of recovery from sympathetic activation affecting excitation transfer to aggressive behavior.** *Journal of Experimental Social Psychology*, 1974(Nov), Vol 10(6), 503-515.—In a pretest, 60 male undergraduates' proficiency to recover from sympathetic arousal induced by strenuous exercise was assessed. Results were used to determine conditions of high, intermediate, and low recovery proficiency (fitness). After an assessment of 48 Ss' unprovoked aggressiveness, Ss were aggressively provoked. Within proficiency blocks, they were then given 1 of 2 treatments: (a) sitting followed by exercising (no decay) or (b) exercising followed by sitting (partial decay). Ss were then provided with an opportunity to retaliate against their tormentor. Findings show that under conditions in which apparent extero- and/or interoceptive cues of prior arousal were present, provocation did not increase aggressiveness. However, under conditions in which cues of prior arousal were not present, and excitatory residues still prevailed, aggressiveness did increase. Overall data indicate that provoked aggressiveness is not proportional to the magnitude of arousal active at the time retaliatory opportunities are provided.—*Journal abstract*.

## NEUROLOGY AND PHYSIOLOGY

4533. Bergström, R. M. (U Helsinki, Inst of Physiology, Finland) **Entropy and information in fetal behavior.** In G. Gottlieb (Ed), *Studies on the development of behavior and the nervous system: II. Aspects of neurogenesis.*

New York, NY: Academic Press, 1974. xv, 287 p.—Discusses research on the development of order in fetal behavior and presents a quantitative entropy model of the fetal brain. This model, tested on the guinea pig fetus, indicates that the information content of fetal behavior depends not only on the size of the maturing central nervous system but also on the level of excitation of the central nervous system effected by the afferent input. (38 ref)

4534. Berry, Martin. (U Birmingham, Medical School, England) **Development of the cerebral neocortex of the rat.** In G. Gottlieb (Ed), *Studies on the development of behavior and the nervous system: II. Aspects of neurogenesis.* New York, NY: Academic Press, 1974. xv, 287 p.—Reviews investigations from the literature, tracing the characterizations of the cerebral cortex during pre- and neonatal periods. The evolution of the neocortex—from the primitive pyriform type through archicortex to neocortex by a genetic-environmental change which prolongs mitosis in the ventricular zone and permits the guidance system to persist—is described, and the late ontogeny of microneurons as an inhibitory mechanism in the insulation of the central nervous system is postulated. (13 p ref)

4535. Crain, Stanley M. (Albert Einstein Coll of Medicine, Rose F. Kennedy Ctr for Research in Mental Retardation & Human Development, Yeshiva U) **Tissue culture models of developing brain functions.** In G. Gottlieb (Ed), *Studies on the development of behavior and the nervous system: II. Aspects of neurogenesis.* New York, NY: Academic Press, 1974. xv, 287 p.—Summarizes the major evidence in support of model systems of brain cellular tissue culture and points out the limitations involved in extrapolating data from minute, neuronally isolated bits of central nervous system tissues in culture back to problems of central nervous system development in the intact organism. (7 p ref)

4536. Galin, David. (U California, Langley Porter Neuropsychiatric Inst, San Francisco) **Implications for psychiatry of left and right cerebral specialization: A neurophysiological context for unconscious processes.** *Archives of General Psychiatry*, 1974(Oct), Vol 31(4), 572-583.—Presents a brief review of hemispheric specialization for different cognitive modes and of the symptoms that follow disconnection of the 2 hemispheres by commissurotomy. Parallels are noted between some aspects of the mental processes of the disconnected right hemisphere and some aspects of primary process thinking and repression. The hypothesis is proposed that in normal intact people mental events in the right hemisphere can become disconnected functionally from the left hemisphere (by inhibition of neuronal transmission across the cerebral commissures) and can continue a life of their own. This hypothesis suggests a neurophysiological mechanism for at least some instances of repression and an anatomical locus for the unconscious mental contents. (129 ref)—*Journal abstract.*

4537. Goldstein, Murray. (NIH, National Inst of Neurological Diseases & Stroke, Bethesda, MD) **Brain research and violent behavior.** *Archives of Neurology*, 1974(Jan), Vol 30(1), 1-35.—Summarizes 4 workshop reports on investigations of the brain and aggressive behavior. Topics include neuroanatomical and neuro-

physiological studies; neurochemical, endocrine, pharmacological, and genetic studies; behavioral studies; and clinical studies.

4538. Gottlieb, Gilbert (Ed). **Studies on the development of behavior and the nervous system: II. Aspects of neurogenesis.** New York, NY: Academic Press, 1974. xv, 287 p.

4539. Hughes, A. F. (Case Western Reserve U) **Endocrines, neural development, and behavior.** In G. Gottlieb (Ed), *Studies on the development of behavior and the nervous system: II. Aspects of neurogenesis.* New York, NY: Academic Press, 1974. xv, 287 p.—Suggests that endocrine control of nervous development and the neural basis of the ontogeny of behavior should be considered together and discusses the problems of structure and function with respect to 3 classes of vertebrates: the anura, the urodeles, and mammals. (5 p ref)

4540. Jacobson, Marcus. (Johns Hopkins U) **A plentitude of neurons.** In G. Gottlieb (Ed), *Studies on the development of behavior and the nervous system: II. Aspects of neurogenesis.* New York, NY: Academic Press, 1974. xv, 287 p.—Notes the morphological and functional diversity of the very large number of nerve cells in the nervous system of vertebrates and discusses the selection process in which the competitive interactions between neurons of diverse functional capabilities results in the survival of those with functional and structural congruence. The development of Class I and Class II neurons is traced. (36 ref)

4541. Riddell, William; Corl, Kenneth; Bennett, Van D. & Reimers, Richard O. (State University Coll New York, Brockport) **Discrimination learning differences and similarities as a function of brain index.** *Physiology & Behavior*, 1974(Sep), Vol 13(3), 401-405.—Tested 7 tree shrews, 10 squirrel monkeys, and 12 college students on a series of extradimensional shifts involving position and brightness dimensions. While the number of errors each species made per problem differed and conformed to an index of central nervous system development, there were no consistent differences between species in terms of the percentage of total errors per problem. Results indicate the lack of functional differences between those species tested. (18 ref)—*Journal abstract.*

4542. Székely, George. (U Pécs, Medical School, Hungary) **Problems of neuronal specificity in the development of some behavioral patterns in amphibia.** In G. Gottlieb (Ed), *Studies on the development of behavior and the nervous system: II. Aspects of neurogenesis.* New York, NY: Academic Press, 1974. xv, 287 p.—Surveys the results and proposes alternative interpretations of 3 basic experiments on which the theory of neuronal specificity has been based: corneal specificity, cutaneous local sign specificity, and myotypic specificity. (3 p ref)

#### Neuroanatomy & Electrophysiology

4543. Batini, C. & Buisseret, P. (U Paris VI, Lab of Sensory Psychophysiology, France) **Sensory peripheral pathway from extrinsic eye muscles.** *Archives Italiennes de Biologie*, 1974(Jan), Vol 112(1), 18-32.—Recorded the response of cerebellar Purkinje cells to stimulation of nerves to the extrinsic eye muscles in anesthetized cats in

order to determine the peripheral pathway for proprioceptive fibers from the muscles. The effects of cutting the muscle nerves or the ophthalmic division of the trigeminal nerve led to the general conclusion that the proprioceptive fibers are in the muscle nerve for the intraorbital part but then cross to the ophthalmic nerve for the intracranial passage to the brain stem. This applies to all branches of nerve III and to nerve IV, but some of the proprioceptive fibers from the lateral rectus muscle appear to remain with nerve VI.—W. A. Wilson.

4544. Borges, Salvador & Butler, Stuart. (Medical School, Birmingham, England) Use of a commercial photographic flashgun as an optical stimulator. *Physiology & Behavior*, 1974(Nov), Vol 13(5), 719-720.

4545. Everhart, J. D.; China, C. L. & Auger, R. A. (VA Hosp, Salisbury, NC) Measures of EEG and verbal intelligence: An inverse relationship. *Physiological Psychology*, 1974(Sep), Vol 2(3-A), 374-378.—An inverse relationship existed between WAIS verbal IQ scores and measures obtained from a commercial EEG device, the neural efficiency analyzer, administered to a total of 73 18-63 yr old adult volunteers representing a variety of occupations and educational ranges. It is concluded that the relationship was one between psychometric verbal intelligence and spontaneous ongoing EEG frequency. The amount of variance accounted for by the correlation was too small, however, to warrant use of the instrument as a predictor of psychometric intelligence. (23 ref) —Journal abstract.

4546. Flanigan, W. F. (US Naval Undersea Ctr, Biomedical Div, San Diego, CA) Sleep and wakefulness in chelonian reptiles: II. The red-footed tortoise, *Geochelone carbonaria*. *Archives Italiennes de Biologie*, 1974(Jul), Vol 112(3), 253-277.—Made electrographic recordings from the forebrain, midbrain, orbital cavity, nuchal muscles, and dorsal shell of 5 tortoises for 7-10 days. Spontaneous behavior and response to stimuli were also noted. 4 postures were identified, 2 of which were thought to denote behavioral sleep. EEGs were slightly lower in frequency and amplitude during sleep. Slow waves and paradoxical sleep were not seen, but arrhythmic spikes and sharp waves (which characterize tortoise EEGs) were most common during sleep. These wave forms increased in frequency during recovery from 48 hrs of enforced wakefulness. It is suggested that the generators of reptilian spikes and slow waves may be analogous to the generators of slow waves in higher vertebrates.—W. A. Wilson.

4547. Flanigan, W. F.; Knight, C. P.; Hartse, K. M. & Rechtschaffen, A. (US Naval Undersea Ctr, Biomedical Div, San Diego, CA) Sleep and wakefulness in chelonian reptiles: I. The box turtle, *Terrapene carolina*. *Archives Italiennes de Biologie*, 1974(Jul), Vol 112(3), 227-252.—Made electrographic recordings from the forebrain, midbrain, orbital cavity, extraocular and nuchal muscles, and dorsal shell of 10 turtles for 7-9 days. Spontaneous behavior and response to stimuli were also noted. 4 postures were identified, 2 of which were thought to denote behavioral sleep. Unlike mammals and birds, there were long periods which could not be easily classified as either sleep or wakefulness. EEGs were slightly lower in frequency and amplitude during sleep. Slow waves and paradoxical sleep were not seen,

but arrhythmic spikes and sharp waves (which characterize turtle EEGs) were most common during sleep. These wave forms increased in frequency during recovery from 48 hrs of enforced wakefulness. It is suggested that sleep evolved at least 300 million yrs ago, before the separation of the reptilian, avian, and mammalian lineages.—W. A. Wilson.

4548. Gondeck, Allan R. & Smith, Jack R. (U Florida) Dynamics of human sleep sigma spindles. *Electroencephalography & Clinical Neurophysiology*, 1974(Sep), Vol 37(3), 293-297.—Describes a computerized study of between Ss, night-to-night, and epoch-to-epoch variations in the frequency of activity of human sleep sigma spindles. Frequency was defined in terms of the time between alternate zero crosses of the filtered EEG. Data collection was performed using a nest structure: 20 spindles from each of 3 epochs of Stage 2 sleep from each of 2 nights' sleep from each of 5 Ss. Average frequencies for 3 groups of Ss (10-15, 20-40, and over 65 yrs of age) were 12.90, 13.57, and 13.60 c/sec, respectively; significant differences ( $p < .10$ ) were obtained between the frequencies of the youngest Ss and the other 2 groups, but not between the middle and oldest groups. Average frequencies within the individual sigma spindles were remarkably stable (i.e., the night-to-night variations were quite small). The average frequency tended to be less in the middle of the night. (French summary) —Journal summary.

4549. Heath, Robert G. & Harper, Jon W. (Tulane U, Medical School) Ascending projections of the cerebellar fastigial nucleus to the hippocampus, amygdala, and other temporal lobe sights: Evoked potential and histological studies in monkeys and cats. *Experimental Neurology*, 1974(Nov), Vol 45(2), 268-287.—Evoked potential findings in 10 adult male rhesus monkeys and 3 histological findings in 18 adult male cats and 3 additional monkeys suggest that the cerebellar fastigial nuclei, through direct connections to the temporal neocortex and deep temporal lobe sites, can profoundly affect the function of the higher nervous system and behavior. (45 ref)

4550. Heppner, Thomas J. (Rush-Presbyterian—St Luke's Medical Ctr, Chicago, IL) Stimulus-analyzing mechanisms in the cat visual cortex. *Experimental Neurology*, 1974(Nov), Vol 45(2), 257-267.—Observed 56 individual neurons in the visual cortex of 31 cats while the orientation and intensity of illumination of a preferred visual stimulus was varied. In addition to showing the typical sensitivity to stimulus orientation the units were also sensitive to intensity. 52 units increased firing rate with increased intensity. Thus, even at higher levels of the visual pathway where neurons are noted for their ability to abstract elements of form from the total visual input, intensity continues to exert a major influence. For a given neuron various combinations of intensity and orientation produced the same response. Results do not support a "place" theory of pattern recognition. (20 ref)—Journal abstract.

4551. Ishiko, Nobusada. (Medical Coll Miyazaki, Japan) Local gustatory functions associated with segmental organization of the anterior portion of cat's tongue. *Experimental Neurology*, 1974(Nov), Vol 45(2), 341-354.—Electrophysiological studies of the tongues of

26 cats show that the anterior branch field of the lingual nerve responded poorly to all taste qualities but responded strongly to cooling of the tongue. The medial branch field was highly responsive to NaCl, water, and warmed saline, whereas the responsiveness of the posterior branch field to HCl was stronger than other areas. Findings show localization of specific sensory properties over different tongue regions.

4552. Iwahara, Shinkuro; Noguchi, Setsuko; Yang, Kuo-Man & Oishi, Hiroshi. (Tokyo U of Education, Japan) **Frequency specific and nonspecific effects of flickering lights upon electrical activity of the human occiput.** *Japanese Psychological Research*, 1974(May), Vol 16(1), 1-7.—Observed the occipital EEG under rhythmic photic stimulation (F) and under nonflicker (NF) stimulation for 11 healthy human adults. Data were frequency-analyzed, and the obtained values in 10-sec units for 7 frequency bands were used as cortical responses. The spontaneous or NF activity was blocked by eye opening (EO) for all bands, particularly for the alpha band in which the S's spontaneous alpha activity was included. The same blocking effect (I) was observed by flicker both with eyes closed and opened, and this effect was relatively independent of flicker frequency. The nonspecific I effect was estimated per band, and the frequency-specific effect (FE) was computed by adding the absolute value of I to the difference in the cortical response between F and NF. The FE spectrum in relation to the NF spectrum was little affected by EO, was only slightly different in dominant-alpha and poor-alpha Ss, and had a wider distribution with a higher mode.—*Journal abstract.*

4553. Kutas, Marta & Donchin, Emanuel. (U Illinois) **Studies of squeezing: Handedness, responding hand, response force, and asymmetry of readiness potential.** *Science*, 1974(Nov), Vol 186(4163), 545-548.—7 right-handed and 4 left-handed male university students squeezed an electronic dynamometer at each of 3 force levels with both their right and left hands. In right-handed Ss the premovement readiness potentials were larger over the hemisphere contralateral to the responding hand. Left-handed Ss showed contralateral dominance when responding with the right hand but not when responding with the left hand. Data suggest that in the potentials studied there is a component associated with the preparation to perform a specific movement, rather than with generalized preparatory processes. (19 ref) —*Journal abstract.*

4554. Lazarus, Gary M. **The visual evoked potential: A discussion of its morphology, function, as well as recording and averaging techniques: III.** *Journal of the American Optometric Association*, 1974(Aug), Vol 45(8), 946-951.—Reviews the literature, tracing the development of research into the human visual evoked potential (VEP) from 1950 when the VEP was transcranially recorded using superimposition and averaging techniques. Differentiation of a primary complex formed by the 1st 3 waves from a secondary complex formed by waves with greater latency is noted as a breakthrough in VEP morphology. Among the empirical data discussed are identification of a photic evoked response using a monopolar electrode technique; spatiotemporal mapping of the VEP; modification of VEP waves in relation to

photopic and scotopic receptors of the retina; correspondence of the electrical field of the VEP to the alpha activity of the occipital region; relation of VEP variability to the intensity, frequency, and shape of the stimulus; and development of the VEP as a function of age.—B. McLean.

4555. Meyerson, B. A. & Persson, H. E. (Karolinska Sjukhuset, Stockholm, Sweden) **Early epigenesis of recipient functions in the neocortex.** In G. Gottlieb (Ed), *Studies on the development of behavior and the nervous system: II. Aspects of neurogenesis*. New York, NY: Academic Press, 1974. xv, 287 p.—Examines 3 types of cortical evoked responses—somesthetic interhemispheric, and visual—and describes experiments performed on sheep fetuses, externalized and kept in contact with the placenta. The gross morphology of evoked surface of intra- and subcortical responses and the concomitant extracellular unitary activity are described. (4 p ref)

4556. Persson, Jan. (Sahlgren Hosp, Göteborg, Sweden) **Comments on estimations and tests of EEG amplitude distributions.** *Electroencephalography & Clinical Neurophysiology*, 1974(Sep), Vol 37(3), 309-313.—Considers that in calculating errors connected with estimations of EEG amplitude distributions and in testing the normality of the signal, it is necessary that the signal be stationary and that the samples derived from the signal are mutually independent. A series of tests, including Kolmogorov-Smirnov tests, applied to an EEG sequence demonstrate that an experimental design giving a mutual dependence of less than .5 between adjacent samples may be allowed. (French summary) (20 ref)

4557. Powell, Ervin W. & Hines, Garth. (U Arkansas, Medical School, Little Rock) **The limbic system: An interface.** *Behavioral Biology*, 1974(Oct), Vol 12(2), 149-164.—Much research has related limbic structure with hypothalamic function rather than with higher nervous system function. Most studies have dealt with single limbic structures rather than with several as interrelated functional systems. Consideration of the total limbic-structure complex indicates that the septum-hippocampus-amygdala form an interface between the isocortex and the thalamus. The author's work relating to projections of the limbic system, especially the septal area, has directed attention to the thalamus as a particularly important target of limbic system projections. Work on projections of the cingulate gyrus reveals that this cortical area projects strongly to other cortical regions as well as to thalamic nuclei. The orbital frontal cortex, cingulate gyrus, and hippocampal gyrus are isocortical areas which then link the limbic system with other corticothalamic systems. This feature, plus strong thalamic connections from the hippocampus, septum, and amygdala, provide a basis for considering the limbic system as an interface between the overlying cerebral isocortex and thalamic structures. This interface may be a key integrating system related to selective modulation of emotion and sensory mechanisms of the brain via a number of feedback circuits wherein recycling could be effected through the temporal and/or the frontal cortex. (5 p ref)—*Journal abstract.*

4558. Rollman, Gary B. (U Western Ontario, London, Canada) **Electrocutaneous stimulation.** In *Conference on*

cutaneous communication systems and devices. Austin, TX: Psychonomic Society, 1974. vi, 122 p.—Reviews the literature on the influence of intensity and time on the response of the somatosensory system to percutaneous electrical stimulation. Studies of pain associated with electrical stimulation are also discussed, and different mechanisms underlying the neural transduction of electrical and mechanical forms of cutaneous activation are suggested. Technical and methodological issues in experimental design and equipment are considered. (79 ref)

4559. Rosenfeld, J. Peter; Hetzler, Bruce E. & Kosnik, William. (Northwestern U, Cresap Neuroscience Lab) **Operant photic evoked potential control, unmediated by selective orientation.** *Physiology & Behavior*, 1974(Sep), Vol 13(3), 479-482.—Operantly conditioned 4 rats to increase late negative components of photic evoked potentials. The expected positive relation between component size and light intensity, assuming trivial mediation via selective orientation, was not found.

4560. Schlag, J.; Lehtinen, I. & Schlag-Rey, M. (U California, Los Angeles) **Neuronal activity before and during eye movements in thalamic internal medullary lamina of the cat.** *Journal of Neurophysiology*, 1974(Sep), Vol 37(5), 982-995.—Recorded single-unit activity in the thalamic internal medullary lamina in 10 cats while they made spontaneous exploring saccades evoked by partial reinforcement. Results show that 106 units showed patterns of firing consistently associated with eye movements and indicate that the intralaminar thalamic region, which has widespread connections with other parts of the brain, is involved in the central control of the gaze. (47 ref)

4561. Schneider, Anne S. & Davis, Joel L. (Northern Illinois U) **Interactions of the evoked responses to visual, somatic, and auditory stimuli in polysensory areas of the cat cortex.** *Physiology & Behavior*, 1974(Sep), Vol 13(3), 365-372.—Recordings of evoked potentials in the middle suprasylvian gyrus of 14 cats were obtained to pairings of visual, auditory, and somatic stimuli, and 2 response measures were compared. It was found that amplitude recovery of the response to the 2nd stimulus was delayed for pairings of like stimuli as compared to unlike pairings, an effect not altered by varying the intensity of the 1st stimulus. tentorium of the cat. *Physiology & Behavior*, 1974(Nov), Vol 13(5), 715-717.

4564. Steriade, M. & Deschênes, M. (U Laval, Lab de Neurophysiologie, Québec, Canada) **Inhibitory processes and interneuronal apparatus in motor cortex during sleep and waking: II. Recurrent and afferent inhibition of pyramidal tract neurons.** *Journal of Neurophysiology*, 1974(Sep), Vol 37(5), 1093-1113.—Studied changes in inhibition of pyramidal tract neurons recorded from the motor cortex during EEG patterns of light sleep and waking in 42 encéphale isolé cats, and during behavioral drowsiness, slow sleep, arousal, and steady wakefulness in 11 chronically implanted rhesus monkeys. Recurrent inhibition was elicited by stimulating the pes pedunculi, and afferent inhibition was obtained by stimulating the specific thalamus. Results show that the period of suppressed spontaneous firing and associated focal slow waves following antidromic or afferent stimuli was 2-3 times shorter during arousal and steady waking than during slow sleep. The increased excitatory drive limiting the duration of the inhibitory period during steady waking and the inhibition of interneuronal activities on arousal are discussed. Deep but short inhibition during waking is viewed as a mechanism leading to sharpening and accuracy in the analysis of incoming messages and the ability to follow rapidly recurring activity. (18 ref)—*Journal summary*.

4565. Steriade, M. (U Laval, Laboratoire de Neurophysiologie, Québec, Canada) **Interneuronal epileptic discharges related to spike-and-wave cortical seizures in behaving monkeys.** *Electroencephalography & Clinical Neurophysiology*, 1974(Sep), Vol 37(3), 247-263.—Micro-electrode recordings of unit firing and local slow waves from the precentral motor cortex of chronically implanted, sitting rhesus monkeys demonstrated the occurrence, during drowsiness, of focal epileptic events with typical 3-sec spike-and-wave discharges, lasting 5-17 sec and associated with tonic eye movements. The seizures appeared either spontaneously or as discharges following protracted single-shock stimulation or repetitive shocks to the specific thalamic nuclei. (French summary) (31 ref)

4566. Steriade, M.; Deschênes, M. & Oakson, G. (U Laval, Lab de Neurophysiologie, Québec, Canada) **Inhibitory processes and interneuronal apparatus in motor cortex during sleep and waking: I. Background firing and responsiveness of pyramidal tract neurons and interneurons.** *Journal of Neurophysiology*, 1974(Sep), Vol 37(5), 1065-1092.—Conducted a series of experiments on 11 chronically implanted rhesus monkeys in which extracellular recordings were made from the arm area of the precentral gyrus during slow sleep, arousal, and excited and quiet wakefulness. The short period of arousal from sleep and excited wakefulness were the only behavioral states during which the change in mean rate firing of fast-conducting pyramidal tract (PT) neurons contrasted with that of slow-conducting PT units. Additional findings suggest that powerful interneuronal activities exist during steady states of both slow sleep and wakefulness and that their inhibition is confined to the short period of arousal. The finding of increased spontaneous firing in both fast and slow PT cells during steady waking is attributed to both strong excitation

during the state along the specific thalamocortical pathway and shorter periods of recurrent and afferent inhibition during waking. (46 ref)—*Journal summary*.

4567. Updyke, Bruce V. (U Oregon) **Characteristics of unit responses in superior colliculus of the Cebus monkey.** *Journal of Neurophysiology*, 1974(Sep), Vol 37(5), 896-909.—Studied the response characteristics of 229 neurons in the superior colliculus in 6 chronically prepared Cebus monkeys. Most units moved to stationary stimuli, but units selective for directions of movement were rare. Most superficial-layer units were selective for stimulus size, and occasional units were selective for stimulus orientation. A small number of neurons responded selectively to real objects. Neurons in the deeper layers had very large visual response fields. Half of all deep neurons responded selectively to objects, and some responded only to objects close to or approaching S's head; 39% of the deep units exhibited auditory or somesthetic response fields. Findings suggest that the primate colliculus integrates information about the behavioral importance of a stimuli and that this activity is compatible with a role in mediating visual attention and in facilitating visual orienting. (36 ref)—*Journal summary*.

4568. Vignaendra, Velupillay. (U Malaya, Kuala Lumpur, Malaysia) **Positive occipital sharp transients of sleep: Relationships to nocturnal sleep cycle in man.** *Electroencephalography & Clinical Neurophysiology*, 1974(Sep), Vol 37(3), 239-246.—Obtained overnight polygraphic recordings from 6 20-33 yr old Ss with normal diurnal waking and sleep EEGs and no significant neurological findings. Ss displayed prominent physiologic "positive occipital sharp transients of sleep" (POSTS) which were related to the nocturnal sleep cycle. POSTS occurred frequently during all stages of NREM sleep and more often during Stages 2 and 3 than 1 and 4. POSTS were absent or very infrequent during REM sleep. Similarities were observed between these potentials and the lambda waves found in awake Ss who visually explored an illuminated patterned field. It is suggested that POSTS of human Ss may indicate that some form of "playback" of information takes place during NREM sleep in cortical areas related to vision and that this playback may be to examine visual material collected during the day and compress relevant data for long-term memory storage. (French summary) (41 ref)—*Journal summary*.

4569. Walters, James K. & Hatton, Glenn I. (Michigan State U) **Supraoptic neuronal activity in rats during five days of water deprivation.** *Physiology & Behavior*, 1974(Nov), Vol 13(5), 661-667.—Recorded the maintained single cell activity from 55 male Holtzman albino rats deprived of water for 0, 1, 2, 3, 4, or 5 days; blood samples were obtained following recording. Mean supraoptic (Soa) cell firing rates were significantly elevated above Day 0 at Days 1, 3, and 4; rates of surrounding anterior hypothalamic (Haa) cells did not change with deprivation. Both plasma specific gravity and mean Soa cell firing rates showed increases on deprivation Day 1 and decreasing trends by Day 5, possibly suggesting a functional relationship. Significantly more Soa units (67%) than Haa units (15%) fired in a phasic pattern. The rate within bursts for Soa phasic

neurons continued to rise with prolonged deprivation, much like plasma osmotic pressure, and may be more closely related to antidiuretic hormone depletion than overall mean rates. (28 ref)—*Journal abstract*.

4570. Wolfe, James W. (USAF School of Aerospace Medicine, Clinical Sciences Div, Brooks Air Force Base, TX) **Technique for chronic head restraint and electrophysiologic recording in the awake rhesus monkey.** *Physiology & Behavior*, 1974(Sep), Vol 13(3), 461-464.—Describes a method for attaching a restraint pedestal to the skull of rhesus monkeys. This device can be used for recording electrophysiologic data in almost any experiment that requires the animal to be awake but unable to move its head. Animals have been maintained with pedestals for periods of 12-14 mo.

4571. Wolff, P. H. et al. **The effect of white noise on the somatosensory evoked response in sleeping newborn infants.** *Electroencephalography & Clinical Neurophysiology*, 1974(Sep), Vol 37(3), 269-274.—Studied the effects of continuous white noise on the somatosensory evoked response (SER) of 21 newborn infants during both REM and NREM sleep. White noise enhanced the amplitude and increased the latency of the late components of the SER in both sleep states. Results are discussed in terms of the interaction between a continuous monotonous stimulus and a discrete repetitive stimulus, and the sleep-inducing effects of monotonous stimulation. (French summary) (32 ref)—*Journal summary*.

#### Physiological Processes

4572. Bakhuis, W. L. (Netherlands Central Inst for Brain Research, Amsterdam) **Observations of hatching movements in the chick, Gallus domesticus.** *Journal of Comparative & Physiological Psychology*, 1974(Nov), Vol 87(5), 997-1003.—Made a film analysis of the hatching movements of White Leghorn chicks placed in transparent glass "eggshells." During every hatching burst, each of the limbs first extended, then flexed beyond the original resting point, and finally extended again to the original resting point (as seen from the body). This suggests that all 4 limbs helped to hold the body of the embryo tightly in place inside the egg during a cracking phase, enabling the beak to perform the actual cracking of the shell. Subsequently during a turning phase, the limbs contributed to rotation of the embryo in the eggshell, bringing the animal in the right position for further breaking the shell during the next burst. The effective forces against the shell, leading to rotation of the animal in the egg, were probably performed by (a) the right leg during its flexion, (b) the right wing during its flexion, and (c) the left wing during its re-extension. (17 ref)—*Journal abstract*.

4573. Beauchamp, Gary K. (U Pennsylvania, Monell Chemical Senses Ctr) **The perineal scent gland and social dominance in the male guinea pig.** *Physiology & Behavior*, 1974(Nov), Vol 13(5), 669-673.—Examined the relationship between sebum production of the perineal glands of male guinea pigs and social dominance. Exp I with 12 males indicated that, while sebum production before social grouping did not predict subsequent position in a dominance hierarchy, sebum production after 6 wks of group living did reflect relative dominance

status with more dominant Ss producing larger quantities. Further, social grouping resulted in increased sebum production in all Ss. The frequency of the perineal drag, a scent-marking behavior, was positively related to social status and hence sebum production. In Exp II with 9 male and 8 female Ss it was found that changes in dominance status were usually followed by changes in the same direction in sebum production. (19 ref)

4576. Di Giusto, Janice A.; Di Giusto, Eros L. & King, Maurice G. (Macquarie U, North Ryde, NSW, Australia) **Heart rate and muscle tension correlates of conditioned suppression in humans.** *Journal of Experimental Psychology*, 1974(Sep), Vol 103(3), 515-521.—Conducted a 2-phase experiment with 55 undergraduate Ss. In Phase 1, Ss in the experimental group received 5 classical aversive conditioning trials with tone conditioned stimulus (CS) and shock unconditioned stimulus (UCS). 2 control groups received tone only or shock only. In Phase 2 the CS alone was superimposed 4 times on a button-pressing task in which the reinforcer was visual stimulation, and suppression of button-pressing, muscle tension, and heart rate were measured. In the experimental group, conditioned suppression to the CS was obtained on each of the 4 test trials, conditioned cardiac acceleration was not evident on Trials 1 and 2 only, and there was no evidence of muscle tension conditioning. The patterns of extinction of suppression and cardiac acceleration across the 4 test trials were not equivalent. It is concluded that (a) previous failures to obtain conditioned suppression in humans were probably due to ineffective procedures rather than to species differences between humans and other vertebrates, (b) autonomic nervous system and skeletal respondents are not necessary for the mediation of conditioned suppression, and (c) aversively conditioned autonomic and behavioral responses are not equally valid indices of emotional response. (27 ref)

4577. Dow, Bruce M. (NIH, National Eye Inst, Lab of Vision Research, Bethesda, MD) **Functional classes of cells and their laminar distribution in monkey visual cortex.** *Journal of Neurophysiology*, 1974(Sep), Vol 37(5), 927-946.—Describes recordings obtained from single color and noncolor cells in the foveal projection region of the striate cortex in anesthetized rhesus monkeys. 6 classes of cells are identified, and it is concluded that the striate cortex performs several parallel functions and that within D. H. Hubel and T. N. Wiesel's class of complex cells are 3 distinct subgroups with different receptive field properties and laminar distributions; there may also be a 4th cell system for color processing. (49 ref)

4578. Engstrom, Robert & Deaux, Edward. (Antioch Coll) **Stomach distention as a regulation of fluid intake.** *Physiological Psychology*, 1974(Sep), Vol 2(3-A), 337-340.—12 male Holtzman albino rats kept on a 23.5 hrs/day water-deprivation schedule were given 30 min access to 4 solutions, each on a separate test day, which were comprised of the factorial combination of 2 temperatures (12 and 37°C) and 2 NaCl concentrations (150 and 450 mOsm/kg). Food, which was available ad lib, and solution consumption measures were taken. More 37°C 150-mOsm/kg solution, which has the fastest stomach clearance rate of the 4, was consumed than of the other 3; short- and long-term food consumption measures were differentially affected by the solution's temperature and concentration. The hypothesis that cues of preabsorptive satiety originate from stomach distention was supported.

4579. Feldman, Herman. (Indiana U) **Salivary buffer capacity, pH and stress.** *Journal of the American Society of Psychosomatic Dentistry & Medicine*, 1974, Vol 21(1), 25-30.—Tested the hypothesis that there is no significant difference in human salivary pH and buffer capacity as a function of stress. Buffer capacity was significantly depressed as stress increased.

4580. Fluor, E. (Karolinska Sjukhuset, Stockholm, Sweden) **Positional and positioning nystagmus as a result of utriculocupular integration.** *Acta Oto-Laryngologica*, 1974(Jul-Aug), Vol 78(1-2), 19-27.—Reviews results of animal and human experiments on positional and positioning nystagmus. Normal and pathological results which are to be expected from the labyrinth during the most suitable positions for nystagmus are presented. A method is described of studying positioning horizontal nystagmus resulting from integrated utriculocupular activity. (German summary) (42 ref)

4581. Gatchel, Robert J. & Lang, Peter J. (U Texas, Arlington) **Effects of interstimulus interval length and variability on habituation of autonomic components of the orienting response.** *Journal of Experimental Psychology*, 1974(Oct), Vol 103(4), 802-804.—The effects of interstimulus interval (ISI) length and variability on habituation of heart-rate and electrodermal components of the orienting response were investigated in an experiment employing 56 male undergraduates. Results indicate that shorter ISI lengths were associated with greater habituation of heart-rate and skin-conductance responses. The ISI variability did not significantly affect habituation. In the statistical analysis of these data, 2 commonly used skin conductance transformation meas-

ures were compared and yielded comparable results.—*Journal abstract.*

4582. Greenberg, Ramon & Pearlman, Chester. **Cutting the REM nerve: An approach to the adaptive role of REM sleep.** *Perspectives in Biology & Medicine*, 1974(Sum), Vol 17(4), 513-521.—Reviews studies of the effects of REM-sleep deprivation on the retention of learned habits. The suggestion is made that apparent contradictions in the overall pattern of results can be resolved by distinguishing "prepared" and "unprepared" types of learning; the former may be roughly equated with learning for which the animal has an instinctive tendency to perform the necessary response. It is concluded that "prepared" learning is not blocked by REM-deprivation, whereas "unprepared" learning is blocked and, therefore, is termed "REM-dependent." (51 ref)—*J. Crabbe.*

4584. Inglis, I. R. (U Bristol, England) **Heart rate responses of the hooded rat to low intensity white noise onset and offset.** *Physiological Psychology*, 1974(Sep), Vol 2(3-A), 310-312.—The heart-rate (HR) responses of 10 male Lister hooded rats to the novel offsets or onsets of a low-intensity white noise were measured. Basal resistance levels of the Ss were monitored concurrently with HR to assess whether the intensity of stimulus used was stressful to the Ss. No change in the basal resistance levels was found over the trial, suggesting that the noise level was not stressful. A brief deceleration of HR was found as a response to both types of test stimulus. Findings are consistent with the view that HR acceleration in response to a novel auditory stimulus reported by some earlier workers was probably produced by a defense reflex, which in turn was triggered by the higher intensity of stimulus used in these experiments.—*Journal abstract.*

4585. Kiely, William F. (U Southern California, Medical School, Los Angeles) **Critique of mystical states: A reply.** *Journal of Nervous & Mental Disease*, 1974(Sep), Vol 159(3), 196-197.—Responds to the criticisms of G. K. Mills (see PA, Vol 53:Issue 2) which argued that E. Gellhorn and W. F. Kiely's neurophysiological theory of the states produced during Zen and Yoga meditation is inadequate and in need of revision. The lack of evidence for significant differences between Zen and Yoga meditations is discussed.

4586. Landreth, Janet E. & Landreth, Hobart F. (U Oklahoma) **Effects of music on physiological response.** *Journal of Research in Music Education*, 1974(Spr), Vol 22(1), 4-12.—Data on 22 college students in a music appreciation class indicate significant heart rate changes related to tempo changes in 8 sections of the 1st movement of Beethoven's 5th Symphony and suggest that heart rate response is linked with learning factors and repetitive exposure to music.

4587. Lavie, Peretz. (U Florida) **Differential effects of REM and non-REM awakenings on the spiral aftereffect.** *Physiological Psychology*, 1974(Jun), Vol 2(2), 107-108.—Tested 14 human Ss for spiral aftereffect following REM and NREM awakenings. The Ss were awakened 2

min after the beginning of an REM period and 5 min after the end of an REM period. The duration of a spiral aftereffect was found to be longer for the tests made following REM periods than for the tests made following NREM periods. Results are interpreted to indicate penetration of a cortical arousal during the REM period into wakefulness. The carry-over effect from the sleep stages into the waking state lends support to the theory that the REM state may be superimposed as an ultradian cycle on the 24-hr cycle.—*Journal abstract.*

4588. Leconte, Pierre; Hennevin, Elizabeth & Bloch, Vincent. (CNRS, Gif-sur-Yvette, France) **Duration of paradoxical sleep necessary for the acquisition of conditioned avoidance in the rat.** *Physiology & Behavior*, 1974(Nov), Vol 13(5), 675-681.—Studied the useful duration of the increase of paradoxical sleep (PS) following an avoidance conditioning in 34 male Wistar rats. It was observed that a period of 90-min free sleep immediately consecutive to each conditioning session (15 trials) was sufficient for good retention to occur. A period of 30-min free sleep during which an increase in PS was not observed, did not allow conditioning to be established; 60 min of free sleep, with PS increase, only slightly disturbed the learning curve. Therefore, the time period immediately consecutive to conditioning, during which the integrity of sleep is necessary, is concluded to be between 60 and 90 min. Throughout the course of this period, the duration of PS was augmented during the initial days of conditioning.—*Journal abstract.*

4589. Leon, Michael. (McMaster U, Hamilton, Ontario, Canada) **Maternal pheromone.** *Physiology & Behavior*, 1974(Sep), Vol 13(3), 441-453.—In 7 experiments, it was found that Wistar rat pups ( $N = 1,320$ ) stimulated prolactin secretion in their mothers, inducing the increased food intake necessary to support the metabolic demands of lactation. The great quantity of food that was eaten was subsequently defecated as excess cecotrophe, a substance rich in bacteria emanating from the cecum. The microbial organisms in this anal excreta produced an odor that attracted the pups to the mother, to littermates, and to the cecotrophe itself. It is suggested that this odor may assist in the synchronization of the mother-young relationship. (72 ref)—*Journal abstract.*

4590. Linde, Shirley M. & Savary, Louis M. **The sleep book.** New York, NY: Harper & Row, 1974. 223 p.—Presents a general guide to recent research on sleep states and processes, dreams, waking, and the effects of sleep on the mind and body. Suggestions and information for achieving rest and relaxation, treating insomnia and nightmares, programing dreams, solving problems, and performing memory tasks during sleep are also presented.

4591. Mills, Gary K. & Campbell, Ken. **A critique of Gellhorn and Kiely's mystical states of consciousness: Neurophysiological and clinical aspects.** *Journal of Nervous & Mental Disease*, 1974(Sep), Vol 159(3), 191-195.—Criticizes E. Gellhorn and W. F. Kiely's (see PA, Vol 49:290) attempt to generate a neurophysiological theory which accounts for the psychophysiological states produced during Zen and Yoga meditation because the theory (a) ignores fundamental differences within and between the various meditations, (b) fails to consider certain important published evidence on Yoga

meditation, and (c) provides an ambiguous interpretation of trophotropic and ergotropic effects on the orienting reflex. (19 ref)

4592. **Mittler, Merrill M.; Boysen, Byron G.; Campbell, Lewis & Dement, William C.** (Stanford U, Medical School) **Narcolepsy-cataplexy in a female dog.** *Experimental Neurology*, 1974(Nov), Vol 45(2), 332-340.—Summarizes data on a female toy poodle with a canine form of narcolepsy-cataplexy and for whose atonic episodes no systematic factors were found. Pathological manifestations are analogous to characteristic human narcolepsy. The diagnosis was further confirmed by 2 negative trials with neostigmine (ruling out myasthenia) and 2 positive trials with imipramine. (18 ref)

4593. **Powell, D. A. & Joseph, J. A.** (VA Hosp, Neuroscience Lab, Columbia, SC) **Autonomic-somatic interaction and hippocampal theta activity.** *Journal of Comparative & Physiological Psychology*, 1974(Nov), Vol 87(5), 978-986.—In 2 experiments, a total of 16 New Zealand rabbits were given extended differential classical conditioning training in which tones served as conditioned stimuli (CS) and shock to the eye served as the unconditioned stimulus (UCS). Corneo-retinal potential (CRP), heart rate (HR), and hippocampal EEG conditioned responses were measured. Changes in general somatic activity were also assessed. HR decelerations were associated with early stages of CRP discrimination, whereas HR accelerations and relatively more somatomotor activity were associated with later acquisition. These findings suggest that HR accelerations, associated with asymptotic CRP responding, are mediated via somatomotor changes. Although relatively more hippocampal theta activity was associated with later stages of conditioning, when somatomotor increases occurred theta was also prominent throughout acquisition. This finding suggests that either arousal properties of the CR are instrumental in producing theta or it is correlated with the associative properties of CS-UCS contingencies. (15 ref)—*Journal abstract.*

4594. **Sharma, V. M.; Baskaran, A. S. & Malhotra, M. S.** (Defence Inst of Physiology & Allied Sciences, Delhi, India) **Emotional composure under altitude stress.** *Psychologia: An International Journal of Psychology in the Orient*, 1974(Jun), Vol 17(2), 103-107.—Studied alterations in emotional composure of young adults after they had lived at 13,200 ft for varying lengths of time. Ss were 25 healthy plain-dwellers 21-30 yrs old, 16 unmarried and 9 married. All were from rural communities and none had previously been exposed to high altitudes. Tests used were the Manifest Anxiety Scale, Eysenck's Ranking Rorschach test, the MMPI Depression scale, and Crown's Word Connection list. Ss were tested twice at a low altitude and after 1, 10, 13, 18, and 24 mo at the high altitude. There were no effects on emotional stability or neurotic tendencies but a rise in depression and anxiety was noticed at 10 and 18 mo.—*R. D. Nance.*

4595. **Soumireu-Mourat, Bernard; Destrade, Claude & Cardo, Bernard.** (U Bordeaux, France) **Deep hypothermia in mice: Effect of the interval between learning and treatment.** *Physiology & Behavior*, 1974(Sep), Vol 13(3), 471-473.—77 male BALB/c mice received deep hypothermia at different intervals after partial acquisition in a Skinner box and were tested 24 hrs later. The deficit of

performances was related to the time interval between acquisition and minimum temperature, and no deficit was found when this interval reached 3 hrs. Consolidation duration and memory processes are discussed.

Bosma (Ed), *Oral sensation and perception: Development in the fetus and infant: Fourth symposium.* Washington, DC: US Government Printing Office, DHEW Pub No (NIH) 73-546, 1973. xix, 419 p. \$8.55.

4597. **Stevens, John K. & Worrall, Norman.** (Pennsylvania State U) **External recording of gastric activity: The electrogastrogram.** *Physiological Psychology*, 1974(Jun), Vol 2(2), 175-180.—Reports in the American and Russian literature have suggested that recording of electrical activity from electrodes on the surface of the abdomen (electrogastrogram, or EGG) might be used as a means of measuring gastric motility for psychophysiological research and for clinical purposes. However, the complexity of the recordings has presented problems in specifying relations between the EGG and other measures of gastric activity. In this study, 4 female cats were used to demonstrate the validity of the EGG as a measure of gastric activity by taking recordings from a strain gauge on the stomach wall simultaneously with electrical recordings from the surface of the abdomen. Results also suggest that autocorrelation and Fourier analysis may be used to reduce record complexity and to provide information unattainable by conventional methods. (15 ref)—*Journal abstract.*

4598. **Volo, Alfred & Strouthes, Andrew.** (State U New York, Binghamton) **Saccharin ingestion, weight loss, and mortality in rats.** *Physiological Psychology*, 1974(Sep), Vol 2(3-A), 323-325.—52 male Sprague-Dawley albino rats maintained on 10 g of food and saccharin solutions suffered weight loss and mortality compared with controls maintained on 10 g food and water. Frequency of death was related to amount and concentration of the ingested solution, while weight loss was related only to concentration and absolute amount of saccharin intake. (17 ref)—*Journal abstract.*

4599. **Wu, Su-Yu Chang.** **Effects of enriched environment and visual deprivation on development of brain in rat.** *Acta Psychologica Taiwanica*, 1973, Vol 15, 154-160.—Reports results of experiments with a total of 45 littermate pairs of Berkeley S1 rat pups. When newborn rats were exposed to an enriched (E) or impoverished (I) environment for 30 days, the E rats developed greater cortical weight, lower acetylcholinesterase (AChE) activity per unit weight, and higher ratio of butyrylcholinesterase (BChE) to AChE than their restricted littermates. Typical E-I differences in weight and in enzymatic activity were also found in rats kept in complete darkness, indicating that visual experience was not a necessary component of the E condition that induced changes in occipital and other cortical regions. Visual deprivation affected chiefly the occipital cortex and the superior colliculi. The occipital cortex of dark-raised rats showed lower weight, a lower BChE-AChE ratio, and higher specific AChE activity. However, the

superior colliculi of the dark-raised rats showed a greater BChE-AChE ratio and lower specific AChE activity. (15 ref)—*Journal abstract*.

4602. Buchsbaum, Monte S. (NIMH, Lab of Psychology, Bethesda, MD) **Average evoked response and stimulus intensity in identical and fraternal twins.** *Physiological Psychology*, 1974(Sep), Vol 2(3-A), 365-370.—A group of 30 monozygotic (MZ) and 30 dizygotic (DZ) 18-57 yr old adult twins were studied, using visual and auditory average evoked response (AER) techniques. Vertex evoked responses showed very great similarity in MZ twin pairs and little similarity in DZ twin pairs. Greater heritability of positive than of negative components and a heritability of AER parameters of change with stimulus intensity suggest a functional neurophysiological rather than a simple anatomic source of the AER twin similarities. (34 ref)—*Journal abstract*.

## PSYCHOPHARMACOLOGY AND PHYSIOLOGICAL INTERVENTION

4603. Gaito, John & Gaito, Stephen T. (York U, Downsview, Ontario, Canada) **Interanimal negative transfer of the kindling effect.** *Physiological Psychology*, 1974(Sep), Vol 2(3-A), 379-382.—5 experiments were conducted in which male Wistar donor rats were kindled to the clonic-convulsion stage, sacrificed, and their brains removed. The brain was homogenized, and the supernatant fraction was injected intraperitoneally into recipient experimental Ss which then were subjected to the kindling procedure. Control donors which received no stimulation were included. When the injection involved 2 or more brain amounts, a retarding effect tended to occur with the experimentals. If only 1 brain amount was used for the injection, no change resulted in the kindling rate of these recipients. This interanimal

negative-transfer effect appears to be similar to the intraanimal negative-transfer effect reported by D. C. McIntyre and G. V. Goddard (see PA, Vol 51:6551).—*Journal abstract*.

4604. Kramer, M. S. & Adler, M. W. (Temple U, Medical School) **Intermodal interaction: Effect of sensory stimulation on flurothyl seizure threshold in normal and brain-damaged rats.** *Life Sciences*, 1974(Sep), Vol 15(6), 1153-1160.—Experiments with male Sprague-Dawley albino rats, in which flurothyl-induced seizures were decreased by intermittent photic or tonic stimulation or by bilateral lesions of the cerebral cortex, suggest that seizurogenicity is influenced by the interplay of environmental multimodal inputs as well as by the intermodal interaction of sensory inputs and focal brain damage. (24 ref)

4605. Levy, Carolyn J. & McCutcheon, Bruce. (Florida State U) **Importance of postgestational factors in the satiation of sodium appetite in rats.** *Physiology & Behavior*, 1974(Nov), Vol 13(5), 621-625.—Conducted 2 experiments with a total of 38 sodium-deficient, male Long-Evans hooded rats. The technique of intragastric infusion of isotonic saline was used to examine the role of postgestational factors in the regulation of sodium intake. Exp I demonstrated that the sodium appetite of a Formalin-injected S was satiated by intragastric infusion of sufficient NaCl to restore the S's sodium balance. Exp II demonstrated that a sodium-deficient S's barpressing for NaCl was influenced by the amount of NaCl previously intragastrically infused. As the amount of saline delivered intragastrically to the Ss increased, the amount of saline they worked for decreased. In addition, the infused sodium apparently was as effective as sodium taken orally in satiating the Ss' sodium appetites. (15 ref)—*Journal abstract*.

4606. Morris, Charles J. (Denison U) **The effects of early malnutrition on one-way and two-way avoidance behavior.** *Physiological Psychology*, 1974(Jun), Vol 2(2), 148-150.—Tested the effects of early malnutrition on performance of 1-way and 2-way avoidance tasks by 12 male and 12 female albino rats. Ss malnourished early in life were found to perform better than normal Ss on the 2-way task, but no significant differences were found between groups on the 1-way task. Results are interpreted as indicating that early malnutrition produces a deficit in the ability to inhibit irrelevant or nonreinforced responses.—*Journal abstract*.

4607. Ogihara, Toshio & Nugent, Charles A. (U Arizona, Coll of Medicine) **Serum DBH in three forms of acute stress.** *Life Sciences*, 1974(Sep), Vol 15(5), 923-930.—Examined the changes in serum dopamine- $\beta$ -hydroxylase (DBH) activity in 5 25-56 yr old normal males subjected to 3 forms of acute stress: cold pressor, sustained hand grip, and insulin-induced hypoglycemia. The responses to all 3 of these stresses have been reported to be mediated by the sympathetic nervous system. In spite of striking increases in blood pressure induced by the cold pressor and sustained hand grip tests and the clinical and chemical evidence of hypoglycemia following insulin there was little alteration in serum DBH activity. It is concluded that a change in serum DBH level is not a good measure of acute alterations in

sympathetic nervous system activity in men. (23 ref)  
—*Journal abstract.*

4608. Sara, Susan J. (U Louvain, Ctr for Experimental & Comparative Psychology, Pellenberg, Belgium) **Delayed development of amnesic behavior after hypoxia.** *Physiology & Behavior*, 1974(Nov), Vol 13(5), 693-696.—Trained, in 1 trial, a total of 145 male Wistar rats in 2 experiments to avoid a small dark compartment after which they were submitted to a 10-min hypoxia or sham hypoxia. Different groups were tested at 1, 3, 6, or 24 hrs after treatment. All sham hypoxia groups avoided at all testing times. Hypoxia groups avoided at 1 and 3 hrs but not at 6 or 24 hrs. Results are interpreted as evidence that hypoxia interferes with memory retrieval and not with memory storage. It is suggested that hypoxia produces a behavioral deficit by triggering an abnormal metabolic sequence of the biochemical substrates which are necessary for the retrieval function. (27 ref)—*Journal abstract.*

4609. Sieck, Michael H. & Baumbach, H. Dale. (U California, Riverside) **Differential effects of peripheral and central anosmia producing techniques on spontaneous behavior patterns.** *Physiology & Behavior*, 1974(Sep), Vol 13(3), 407-425.—Describes 2 experiments with a total of 94 male hooded rats. In Exp I, the spontaneous behavior patterns of 4 matched groups were compared to sham-operated or sham-injected Ss following different anosmia producing techniques. One group was peripherally blocked with lidocaine (XYL), and another with zinc sulphate (ZN). 2 operated groups were either centrally deafferented (LB) or sustained olfactory bulb and peduncle destruction (DB). The lesioned and particularly the DB Ss were hyperactive and reared more than the other groups. XYLs were similar to Ss on most measures but many developed unusual locomotor patterns. ZNs were hypoactive, reared less, and groomed and froze more than all other groups. Food deprivation increased activity and rearing and decreased freezing and grooming in all groups, but most intergroup differences were maintained. A technique to distinguish lesion-induced anosmia from lesion side effects was also investigated. Lesions tended to increase activity, rearing frequency, and possibly sniffing frequency somewhat independently of anosmia, whereas grooming and possibly freezing changes were more closely related to olfactory cue changes. Exp II revealed that most of the zinc sulphate effects were due to systemic poisoning. Consequently, the common practice of comparing central and peripheral anosmia producing techniques to demonstrate olfactory deficits aside from lesion effects may be misleading. (30 ref)—*Journal abstract.*

4610. Thomas, J. R. & Bachrach, A. J. (US Naval Medical Research Inst, Bethesda, MD) **Modification of operant performance in pigeons by increased pressures of nitrogen and helium.** *Undersea Biomedical Research*, 1974(Jun), Vol 1(2), 181-188.—Used a multiple fixed ratio-fixed interval schedule as an ongoing baseline to measure differential gas and depth effects on operant behavior of 2 White Carneaux pigeons. Measurements were taken at depths of 66, 99, 200, and 300 fsw. An 80% helium-20% oxygen mixture had less disruptive effects than air on responding on the 2 different reinforcement schedules particularly at 200 and 300 fsw. Repeated

exposure to pressure, independent of gas mixture or depth, resulted in a gradual behavioral adaptation measured by a reduction in the disruption of behavior. (20 ref)—*Journal abstract.*

4611. Young, Robert C. et al. (New York Hosp, Edward W. Bourne Behavioral Research Lab, White Plains) **Absence of satiety during sham feeding in the rat.** *Journal of Comparative & Physiological Psychology*, 1974(Nov), Vol 87(5), 795-800.—In 2 experiments, a total of 9 Sprague-Dawley rats with chronic gastric fistulas were trained to eat a liquid diet. Results indicate that when the fistulas were opened for the first time, Ss sham-fed eagerly and did not become satiated during test periods of 2 or 7.5 hrs. This sustained hyperphagia occurred after long (17 hrs) or short (10-30 min) intermeal intervals. The experience of sustained hyperphagia when gastric fistulas were open did not affect intake of the same diet on the next day when gastric fistulas were closed. When taste and other oropharyngeal stimuli acted alone during sham feeding, they did not elicit satiety. It is concluded that the occurrence of satiety in rats is critically dependent on an inhibitory reflex elicited by ingested food accumulating in the stomach and moving through the small intestine. —*Journal abstract.*

#### Brain & Electrical Stimulation & Lesions

4612. Balagura, S. & Harrell, L. E. (State U New York, Downstate Medical Ctr, Brooklyn) **Lateral hypothalamic syndrome: Its modification by obesity and leanness.** *Physiology & Behavior*, 1974(Sep), Vol 13(3), 345-347.—Found that lesions of the lateral hypothalamus in 30 Charles River female rats, made experimentally obese or lean, were followed by a lengthening or shortening of the aphagic period. Results confirm previous experimental findings and extend the observations to both sexes. Results contradict the theory of a downward shift in body weight set-point following lateral hypothalamic lesions. —*Journal abstract.*

4613. Bauer, Richard H. (U California, Medical School, Los Angeles) **Brightness discrimination of pretrained and nonpretrained hippocampal rats reinforced for choosing brighter or dimmer alternatives.** *Journal of Comparative & Physiological Psychology*, 1974(Nov), Vol 87(5), 987-996.—A total of 96 experimentally naive and pretrained hippocampectomized, cortical control, and nonoperated male Wistar rats were trained to choose either the brighter or dimmer arm of a Y-maze for water reinforcement. Nonpretrained hippocampectomized Ss and to a lesser extent cortical control Ss initially preferred the dimmer arms of the maze. Nonpretrained hippocampectomized, cortical control, and nonoperated Ss reinforced for entering the brighter arm did not differ, but when reinforced for entering the dimmer arm nonoperated Ss were superior to hippocampectomized Ss. Pretrained Ss acquired the discrimination more slowly than nonpretrained Ss, but this deficit was greater for hippocampectomized Ss. (29 ref)—*Journal abstract.*

4614. Butter, Charles M. (U Michigan, Neuroscience Lab) **Visual discrimination impairments in rhesus monkeys with combined lesions of superior colliculus**

and striate cortex. *Journal of Comparative & Physiological Psychology*, 1974(Nov), Vol 87(5), 918-929.—To test the hypothesis that posterior inferotemporal cortex and the adjoining foveal prestriate cortex contribute to vision by combining inputs from striate cortex and superior colliculus, a total of 18 rhesus monkeys with combined collicular and partial striate lesions, foveal prestriate-posterior inferotemporal lesions, or subcortical lesions (controls) were tested in a series of visual discrimination tasks. Prestriate-inferotemporal lesions, unlike striate-collicular lesions, consistently impaired retention of a pattern discrimination and produced partial impairments in a size discrimination test. However, prestriate-inferotemporal and striate-collicular lesions produced similar deficits in pattern discrimination learning and no deficits in brightness discrimination learning. The deficits of the striate-collicular monkeys are discussed with regard to the "input-combining" hypothesis and alternative views. (39 ref)—*Journal abstract*.

4615. Butter, Charles M. (U Michigan, Neuroscience Lab) **Effect of superior colliculus, striate, and prestriate lesions on visual sampling in rhesus monkeys.** *Journal of Comparative & Physiological Psychology*, 1974(Nov), Vol 87(5), 905-917.—27 male rhesus monkeys were tested for pattern discrimination retention and for color discrimination learning, with and without stimulus-response (S-R) separation, following superior colliculus lesions, partial striate cortex lesions, foveal prestriate lesions, or control lesions involving cortical or subcortical structures. Only the prestriate Ss were reliably impaired in pattern retention and in color discrimination tasks without S-R separation. In color discriminations involving S-R separation, collicular Ss were deficient compared either with the controls or with those with striate lesions. These findings suggest that the primate superior colliculus, like prestriate cortex, is involved in visual sampling behavior required by S-R separation, and thus participates in orientation to visual stimuli. (36 ref)—*Journal abstract*.

4616. Chen, Jeannette J. & Bliss, David K. (New York U, Medical Ctr) **Effects of sequential preoptic and mammillary lesions on male rat sexual behavior.** *Journal of Comparative & Physiological Psychology*, 1974(Nov), Vol 87(5), 841-847.—Observed the sexual behavior of 52 male Sprague-Dawley rats prior to and following bilateral medial preoptic, unilateral medial preoptic, bilateral posterior preoptic, bilateral mammillary, and sham lesions. Bilateral medial preoptic lesions and mammillary lesions were made either simultaneously or sequentially within the same Ss in separate groups. Mammillary lesions had no effect on sexual behavior. Complete destruction of the medial preoptic area made prior to, simultaneous with, and following mammillary lesions completely abolished mating behavior. Partial destruction of the medial preoptic area increased mount and intromission latencies and slightly increased ejaculation latency. Results suggest that since there was no change in the postejaculatory-refractory interval, the medial preoptic area mediates sexual arousal but apparently is not involved in a copulatory-ejaculatory mechanism. (32 ref)—*Journal abstract*.

4617. Cole, Sherwood O. (Rutgers State U, Camden) **Changes in the feedback behavior of rats after amygdala**

**la lesions.** *Behavioral Biology*, 1974(Oct), Vol 12(2), 265-270.—The feeding behavior of 12 amygdala-lesioned male Charles-River rats was compared to that of 12 normal controls and 12 amygdala sham controls after 0 or 24 hrs of food deprivation and after 24 hrs of food and water deprivation. Results demonstrate that food deprivation was essential for a significant reduction in 1-hr feeding after dorsomedial amygdala damage and that combined food and water deprivation exaggerated such differences in feeding without producing a significant concomitant reduction in drinking. Findings are discussed in terms of the possible role of the dorsomedial amygdala in the central regulation of deprivation-induced feeding.—*Journal abstract*.

4618. Cools, Alexander R. & Janssen, Hendrik-Jan. (U Nijmegen, Netherlands) **The nucleus linearis intermedius raphe and behaviour evoked by direct and indirect stimulation of dopamine-sensitive sites within the caudate nucleus of cats.** *European Journal of Pharmacology*, 1974(Oct), Vol 28(2), 266-275.—Investigated whether behavioral effects in 16 adult cats elicited by unilateral, reversible lesions in the nucleus linearis intermedius raphe modulate behavioral effects elicited by local application of dopamine into the caput nuclei caudati rostromedialis or by systemic injections of apomorphine. Experimental results suggest that the nucleus linearis is an indispensable link in the chain of intracaudate events triggered by direct or indirect activation of dopamine-sensitive sites within the caudate nucleus and strengthen the hypothesis that there exists a trans-synaptic relationship between nigro-caudate, dopaminergic, and raphe-caudate serotonergic fibres. The implication of these data is discussed with reference to the usefulness of a number of presently accepted test models in psychopharmacological research. (37 ref)—*Journal abstract*.

4619. Coover, Gary; Ursin, Holger & Levine, Seymour. (Northern Illinois U) **Corticosterone levels during avoidance learning in rats with cingulate lesions suggest an instrumental reinforcement deficit.** *Journal of Comparative & Physiological Psychology*, 1974(Nov), Vol 87(5), 970-977.—Studied changes in fear or arousal during 2-way avoidance learning in male Möll-Wistar rats with cingulate lesions. The 12 Ss with lesions restricted to the cingulum bundle and rostral one-third to one-half of the cingulate cortex exhibited no deficit compared with the 15 operated control Ss in the acquisition of 2-way active avoidance. However, the cingulate-lesioned Ss did not exhibit the increase in intertrial sniffing and grooming or the decline in plasma corticosterone levels to the degree observed in control Ss in the course of acquisition and stabilization of the avoidance response. The primary effect of this lesion may therefore be less effective reinforcement of the instrumental response. (24 ref)—*Journal abstract*.

4620. Coulter, Joe D. (U Oklahoma, Health Sciences Ctr, Oklahoma City) **Sensory transmission through lemniscal pathway during voluntary movement in the cat.** *Journal of Neurophysiology*, 1974(Sep), Vol 37(5), 831-845.—Analyzed the amplitude of the mass potential discharge recorded in the left medial lemniscus in response to contralateral forelimb nerve stimulation during spontaneous voluntary forelimb movement in 8 unrestricted, unanesthetized cats. During and just before

electromyographic activity in the right forelimb, evoked lemniscal potentials were decreased compared to adjoining control responses evoked in the absence of movement. Neither muscular activity in the opposite forelimb nor passive forelimb movements in other anesthetized Ss produced similar effects on lemniscal potentials. Potentials were also reduced in amplitude after presentation of an auditory stimulus (tone burst); however, this effect was small and showed a progressive diminution with repeated tone presentations. Results suggest that active movements are accompanied by changes in the transmission of sensory information which may be due to central descending influences on the relay of afferent input through the dorsal column nuclei. (57 ref)—*Journal summary*.

4621. Crews, David. (U California, Berkeley) **Castration and androgen replacement of male facilitation of ovarian activity in the lizard, *Anolis carolinensis*.** *Journal of Comparative & Physiological Psychology*, 1974(Nov), Vol 87(5), 963-969.—Found that castration abolished male courtship behavior in the lizard, and consequently prevented male courtship facilitation of environmentally induced ovarian recrudescence in winter-dormant females. Castrated males given androgen replacement therapy exhibited the normal pattern of male courtship behavior as well as facilitating environmentally induced ovarian activity. (39 ref)—*Journal abstract*.

4622. Divac, Ivan. (U Copenhagen, Inst of Neurophysiology, Denmark) **Caudate nucleus and relearning of delayed alternations in cats.** *Physiological Psychology*, 1974(Jun), Vol 2(2), 104-106.—Refers to earlier studies which demonstrated that lesions in the anterior part of the caudate nucleus impair delayed-response type behavior when made in intact cats, but not if made in cats which learned delayed responses after ablation of the prefrontal cortex. The present experiment tested the hypothesis that the anterior part of the caudate nucleus, if not necessary once the task has been relearned, may be involved in the process of relearning of delayed alternation. 4 cats with lesions in both the prefrontal cortex and the caudate nucleus were able to relearn the task and were not more impaired than 4 cats with ablations of the prefrontal cortex alone. Thus, the anterior part of the caudate nucleus in cats seems to subserve delayed-response type tasks only as long as the prefrontal cortex and mediodorsal thalamic nucleus are preserved. (18 ref)—*Journal abstract*.

4623. Drucker-Colin, R. R. (U Nacional Autónoma de México, Mexico City) **Seizure inhibition and REM sleep: A possible neurohumoral relationship.** *Behavioral Biology*, 1974(Oct), Vol 12(2), 199-209.—Examined the relationship between certain aspects of seizures and REM sleep in 2 experiments with a total of 25 cats that were randomly assigned to being donors or recipients. Donors had a bilateral push-pull chemitrode system implanted in the ventral hippocampus, while recipients had push-pull cannulae implanted in the midbrain reticular formation (MRF). Threshold afterdischarges were obtained from the hippocampus of donor cats, and perfusates were obtained from the contralateral hippocampus during the post-ictal depression period. Such perfusates were then reperfused into the MRF of

recipient cats and slow-wave sleep and REM latencies were obtained and compared to controls. In addition, norepinephrine, 5-hydroxytryptamine (5-HT), acetylcholine, and  $\gamma$ -aminobutyric acid (GABA) were perfused in the hippocampus while the contralateral hippocampus was stimulated to induce afterdischarges. These same substances were then perfused into the MRF in order to determine their effects on sleep latencies. Results show that the post-ictal perfusate significantly reduced REM latencies when compared to all other perfusion tests, while only 5-HT and GABA inhibited afterdischarges. Results are discussed in terms of the relationship between seizures and REM and some aspects of their ontogeny and phylogeny. (30 ref)—*Journal abstract*.

4624. Edmonds, Don E. & Gallistel, C. R. (U Pennsylvania) **Parametric analysis of brain stimulation reward in the rat: III. Effect of performance variables on the reward summation function.** *Journal of Comparative & Physiological Psychology*, 1974(Nov), Vol 87(5), 876-883.—Defines the reward summation function as the empirical function relating running speed in a runway and waiting-box paradigm to the number of electrical pulses a rat receives for running. 5 experiments with male white rats are described in which repeated determination of this function was made, with other performance variables—priming, task difficulty, degree of training, health, and pharmacological state of the rat—varied between determinations. Results show that these other performance factors affected the height (asymptotic speed) of the function but not the location of the sharp rise in the function. It is concluded that since manipulation of stimulation parameters that affect the amount of reward excitation substantially alters the location of the sharp rise, the reward summation function provides a suitable basis for a neuropharmacological investigation of the reward effect in self-stimulation.—*Journal abstract*.

4625. Edmonds, Don E.; Stellar, James R. & Gallistel, C. R. (U Pennsylvania) **Parametric analysis of brain stimulation reward in the rat: II. Temporal summation in the reward system.** *Journal of Comparative & Physiological Psychology*, 1974(Nov), Vol 87(5), 860-869.—Defines reward summation functions as the empirical functions relating running speed in a runway and waiting-box paradigm to the number or current intensity of the electrical pulses a rat receives for running. In an experiment with male white rats, repeated determination of such functions, with another parameter of stimulation varied between determinations, yielded parameter trade-off functions. These functions describe the amount of change required in 1 parameter to compensate for a change in another parameter. These functions place quantitative constraints on the neurophysiological events underlying the reward effect. Results suggest that such constraints mediate the identification of the neurophysiological substrate for the reward effect in self-stimulation.—*Journal abstract*.

4626. Freeman, Frederick G. & Kramarcy, Neal R. (Old Dominion U) **Stimulus control of behavior and limbic lesions in rats.** *Physiology & Behavior*, 1974(Nov), Vol 13(5), 609-615.—20 male Long-Evans rats with hippocampal lesions or sham operations learned a tone discrimination significantly faster than 5 Ss with amygy-

dala lesions. Relative tone generalization gradients were significantly steeper for the Ss with hippocampal lesions than for the other 2 groups. Performance on a light discrimination by the Ss with hippocampal lesions was impaired, compared to the sham-operated Ss, when the tone was present but irrelevant. The behavior of the amygdala Ss is interpreted as due to an inability to inhibit responding. The behavior of the Ss with hippocampal lesions is interpreted as due to an inability to shift attention from one stimulus to another. (18 ref) —*Journal abstract.*

4627. Freeman, Frederick G.; Mikulka, Peter J. & d'Auteuil, Peter. (Old Dominion U) **Conditioned suppression of a licking response in rats with hippocampal lesions.** *Behavioral Biology*, 1974(Oct), Vol 12(2), 257-263.—40 male Long-Evans hooded rats with dorsal hippocampal lesions or sham operations (controls) were trained for 14 days to lick for 1 of 2 sucrose solutions (4 or 32%). They were then given 4 conditioned emotional response training trials to a 4,800-Hz tone and tested for conditioned suppression of licking. Ss with hippocampal lesions licking for the 32% solution showed significantly less suppression than all other groups. It is suggested that behavioral deficits found in animals with hippocampal lesions may be partly due to differences in the motivational levels of the organism. (18 ref)—*Journal abstract.*

4628. Gallistel, C. R. (U Pennsylvania) **Note on temporal summation in the reward system.** *Journal of Comparative & Physiological Psychology*, 1974(Nov), Vol 87(5), 870-875.—Presents a further analysis of data from a study of rats by D. E. Edmonds et al (see PA, Vol 53:Issue 2). This analysis shows that when train duration is fixed, the rewarding effect of a train of cathodal stimulating pulses is determined by the product of the number of pulses (N) and the current intensity (C). If this product remains constant, reward remains constant, despite manyfold changes in the values of N and C. This suggests that there is little facilitation or accommodation in the substrate and that the number of functionally relevant neurons excited by a cathodal pulse increases linearly with current intensity. Beyond train durations of about 250 msec, the required product (NC) increases approximately as a power function of train duration, with an exponent of about .75. Below 250 msec, the required product is approximately constant.—*Journal abstract.*

4629. Gallistel, C. R.; Stellar, James R. & Bubis, E. (U Pennsylvania) **Parametric analysis of brain stimulation reward in the rat: I. The transient process and the memory-containing process.** *Journal of Comparative & Physiological Psychology*, 1974(Nov), Vol 87(5), 848-859.—6 male albino rats ran an alley and pressed a lever for brain stimulation reward. At the end of the 10-min intertrial interval, they received pretrial priming stimulation. Varying the amount (number of trains and number of pulses) of stimulation showed that both the lever-produced stimulation and the pretrial stimulation affected running speed. The 2 effects, however, had different parametric characteristics. An analysis of the transitional responses following changes in the amounts of stimulation further showed that one effect involved a memory for stimulation received on earlier trials, whereas the other effect did not. The experiment provided a

paradigm for independently analyzing the 2 effects. A 2nd experiment showed how this paradigm may be modified to permit automation of the entire procedure.—*Journal abstract.*

4630. Goldman, Patricia S. et al. (NIMH, Lab of Psychology, Bethesda, MD) **Sex-dependent behavioral effects of cerebral cortical lesions in the developing rhesus monkey.** *Science*, 1974(Nov), Vol 186(4163), 540-542.—55 male rhesus monkeys with orbital prefrontal lesions were impaired on behavioral tests at 2½ mo of age, whereas similar deficits were not detected in 49 females with comparable lesions until 15-18 mo of age. Results suggest that the maturation of a cortical region in the primate brain proceeds at different tempos in males and females. (20 ref)—*Journal abstract.*

4631. Goldstein, Melvin L. (Indiana U, Kokomo) **The effect of septal and amygdaloid lesions on the duration of emotionality in the white rat.** *Bulletin of the Psychonomic Society*, 1974(Sep), Vol 4(3), 163-165.—Investigated the duration of the septal syndrome and the reciprocal relationship of the septal and amygdaloid nuclei in their effect on emotional behavior. Gross lesions were placed in the septal nuclei or amygdaloid complex and minute lesions were placed in the medial or lateral septal nuclei in groups of male Holtzman albino rats ( $N = 15$ ). The effects on emotional behavior were measured over a period of 12 days by means of a rating scale. Septal lesions increased emotionality, but amygdaloid lesions did not decrease emotionality. The locus for the rage syndrome was found in the lateral septal nucleus.—*Journal abstract.*

4632. Gonzalez, Manuel F. & Novin, Donald. (U California, Brain Research Inst, Los Angeles) **Feeding induced by intracranial and intravenously administered 2-deoxy-D-glucose.** *Physiological Psychology*, 1974(Sep), Vol 2(3-A), 326-330.—Intracranial injections (Exp I) of 2-deoxy-D-glucose (2DG) given to 20 female free-feeding New Zealand rabbits induced eating when injected in sites located within the lateral hypothalamic area but not within the ventromedial nucleus. However, greater increases were obtained by the administration of systemic injections of the same agent in greater amounts in Exp II (32 Ss). Electrolytic lesions of the lateral hypothalamic area did not suppress the facilitatory effects of systemic injections of 2DG on eating in these Ss. Results suggest that peripheral glucose receptors may be more important than central glucoreceptors in controlling hunger.—*Journal abstract.*

4633. Goodwin, Guy M. & Luschei, Erich S. (U Washington, Regional Primate Research Ctr) **Effects of destroying spindle afferents from jaw muscles on mastication in monkeys.** *Journal of Neurophysiology*, 1974(Sep), Vol 37(5), 967-981.—Recorded jaw movements and associated electromyographic activity in jaw closing muscles before and after trigeminal mesencephalic tract lesions in 5 rhesus monkeys. Data suggest that the traditional emphasis on the function of muscle spindle afferents in the control of muscle contraction may be misleading and that the removal of muscle afferent input results primarily in a sensory loss. (34 ref)

4634. Greenwood, M. R. et al. (Rockefeller U, New York, NY) **Food motivated behavior in genetically obese and hypothalamic-hyperphagic rats and mice.**

*Physiology & Behavior*, 1974(Nov), Vol 13(5), 687-692.—Studied the food-associated behavior of 4 genetically obese Zucker rats (fa/fa) and 4 yellow obese mice (aAy) using classic operant procedures. When obese Zucker rats and yellow mice were compared to their lean littermates ( $n = 8$ ) and lean littermates made obese by electrolytic lesions and chemical lesions ( $n = 8$ ), respectively, the naturally obese animals did not display the behavioral patterns associated with rodents made obese by hypothalamic damage. These experiments point out the necessity for careful selection of animal models in studying behaviors associated with regulatory disturbances of normal food intake. (15 ref)—*Journal abstract*.

4635. Hammond, Geoffrey R. (U Western Australia, Nedlands) **Frontal cortical lesions and prestimulus inhibition of the rat's acoustic startle reaction.** *Physiological Psychology*, 1974(Jun), Vol 2(2), 151-156.—Tested the effects of lesions of the frontal cortex on the amplitude of the acoustic startle reaction in 6 albino rats and 5 normals, both under control (unstimulated) conditions and under conditions where the response was inhibited by delivery of a visual or auditory stimulus just prior to response elicitation. While in no case was brain damage observed to lead to any derangement of the prestimulus inhibition of the response, some Ss showed exaggerated levels of reactivity on control trials postoperatively. Correlations between location of brain damage and postoperative responsivity indicate that damage to the medial sector of the frontal cortex was critical in obtaining augmented levels of startle. (16 ref)—*Journal abstract*.

4636. Hara, Kazuo; Cornwell, P. R.; Warren, J. M. & Webster, Ikuko H. (International Christian U, Tokyo, Japan) **Posterior extramarginal cortex and visual learning by cats.** *Journal of Comparative & Physiological Psychology*, 1974(Nov), Vol 87(5), 884-904.—Reports results of 3 experiments with a total of 59 mongrel and 11 Siamese cats. Extensive ablations of posterior cortex which spared the primary visual areas severely impaired visual pattern discrimination, detour learning, and spatial reversal performance. Lesions in the posterior ecto- and suprasylvian gyri (EP) produced significant deficits in learning multiple object discrimination problems, repeated reversals on spatial or visual cues, and successive visual discriminations. Ss with cortical ablations that did not invade the EP region but did cause damage to the optic radiations were not impaired in reversal learning and were deficient in successive discriminations only when tested with nonsalient cues. Thus, some of the defects shown by EP cats are qualitatively different from the losses in cats with damage to the geniculostriate system. (39 ref)—*Journal abstract*.

4637. Henke, Peter G. (St Francis Xavier U, Antigonish, Nova Scotia, Canada) **Lesions in the ventromedial hypothalamus and response to frustrative nonreward.** *Physiology & Behavior*, 1974(Jul), Vol 13(1), 143-146.—Bilateral lesions in the ventromedial hypothalamus of 16 female Wistar albino rats increased the frustration effect in a double runway. Following the omission of reward in the 1st goal box, Ss with lesions ran faster than 16 controls in the 2nd alley. (20 ref)

4638. Herz, Michael J.; Marshall, Keats E. & Peeke, Harman V. (U California, Langley Porter Neuropsychiatric Inst, San Francisco) **Brain stimulation and behavior: Controls and consequences.** *Physiological Psychology*, 1974(Jun), Vol 2(2), 184-186.—Compared groups of hooded rats, ranging from unimplanted controls to caudate-putamen (CPU) stimulated experimental animals, in terms of the number of trials required to acquire a brightness discrimination habit. Results indicate that the degree of deficit produced was a function of the magnitude of experimental intervention imposed. Ss with headplugs and cables, but without electrodes, required significantly more trials to learn than unimplanted controls. The addition of electrodes without a headcable produced no greater deficit, while electrodes with attached cable resulted in significantly greater disruption than plug and cable alone. Stimulation of the CPU with 1 or 3 bilateral pulses following each discrimination produced significantly greater interference than did the electrode lesion and headcable. Results are discussed in terms of the control conditions required for studies of the effects of brain stimulation on behavior.—*Journal abstract*.

4639. Hodos, W. & Karten, H. J. (U Maryland) **Visual intensity and pattern discrimination deficits after lesions of the optic lobe in pigeons.** *Brain, Behavior & Evolution*, 1974, Vol 19(3), 165-194.—Trained 13 White Carneaux pigeons to discriminate stimuli that differed in luminance or geometric pattern. Following discrimination training, bilateral stereotaxic lesions were made in the optic tectum and in the associated nuclei isthmi, located within the depth of optic lobe. After recovery from surgery, Ss' discrimination performance was again tested. Cases with massive destruction of the optic tectum and either direct or indirect damage to the nuclei isthmi showed extremely severe postoperative deficits in visual discrimination performance. Some cases were unable to reliably discriminate gross stimulus differences even after extensive postoperative retraining. Others eventually were able to perform the simpler discrimination tasks, but failed to recover their preoperative performance capabilities on the more difficult discrimination tasks. Cases with injury confined principally to the nuclei isthmi had less impairment of performance than the ones with injury to the tectum and the isthmic nuclei. Results suggest that lesions of the optic tectum produced more severe and intractable deficits of visual discrimination performance than did lesions of structures more rostral in the tectofugal pathway. Data further suggest a separate role of the nuclei isthmi in the processing of visual information. (44 ref)—*Journal abstract*.

4640. Irwin, Don A.; Criswell, Hugh E. & Kakolewski, Jan W. (Ohio State U, Medical Ctr) **Prolonged slow potential variation associated with cortical spreading depression.** *Physiology & Behavior*, 1974(Sep), Vol 13(3), 377-380.—3 methods of inducing cortical spreading depression in male Long-Evans rats resulted in spreading depression and a prolonged negative slow potential change from subcortical and cortical areas of the brain. This prolonged potential has not been previously considered as a concomitant of cortical spreading depression.

4641. Jarvis, Charlene D. (U Maryland) **Visual discrimination and spatial localization deficits after lesions of the tectofugal pathway in pigeons.** *Brain, Behavior & Evolution*, 1974, Vol 19(3), 195-228.—21 White Carneaux pigeons were trained on 2 identification tasks (intensity and pattern discriminations) and on 2 location tasks (right-left and 4-key discriminations). Following training, lesions were placed in the optic tectum, or in nucleus rotundus or the nuclei isthmi, ascending and descending projections of the tectum, respectively. Large tectal lesions produced severe impairments on all tasks. Ss were unable to relearn the identification tasks and, although able to relearn the location tasks, had great difficulty in locating the keys. The severity of deficits produced among Ss with lesions of nucleus rotundus depended on both lesion size and the extent to which the lesion infringed on the principal optic nucleus of the thalamus (OPT). Small rotundus lesions produced almost no impairment on any task. Larger lesions without OPT involvement produced impairment on identification tasks and differentially affected performance on location tasks. Large lesions of rotundus and OPT produced impairments on all tasks. The size of deficits produced among Ss with lesions of the nuclei isthmi were a function of the completeness of the lesion and did not depend on the extent of damage to other structures in the tectal core. (52 ref)—*Journal abstract*.

4642. Johnson, David A.; Poplawsky, Alex; Lancaster, Josh & Jackson, Richard. (Ohio U) **Techniques and problems in the stereotaxic placement of subcortical lesions in infant rats.** *Physiology & Behavior*, 1974(Sep), Vol 13(3), 465-470.—Outlines techniques used in the stereotaxic placement of subcortical lesions in Long-Evans infant rat pups. Coordinates and lesion parameters for septal, hippocampal, caudate, and amygdaloid lesions at 7 days of age are presented. Housing and handling procedures which increase survival rates are discussed.

4643. Kakolewski, Jan W. & Rowe, Thomas C. (U South Dakota, Medical School) **Elicitation and the dominant character of stimulation-bound escape behavior.** *Physiological Psychology*, 1974(Sep), Vol 2(3-A), 331-332.—2 groups of 6 Holtzman rats each were implanted with bipolar electrodes in the medial forebrain bundle (MFB). Intracranial stimulation (ICS) was set to a minimal level, inducing continuous locomotion. When Ss in Group I were mechanically restrained and ICS continued, all Ss displayed a stimulation-bound escape behavior. Group II, prior to restraint, was exposed to ICS, eliciting continuous locomotion until stimulation-bound eating, drinking, or gnawing was established. When restrained, again, all Ss displayed a consistent stimulation-bound escape behavior but not stimulation-bound eating, drinking, or gnawing. Data indicate that the combination of an internal with an environmental stimulus triggers a potent and highly consistent response dominating all previously established responses to ICS.—*Journal abstract*.

4644. Kearley, Richard C.; Van Hartesveldt, Carol & Woodruff, Michael L. (U Florida) **Behavioral and hormonal effects of hippocampal lesions on male and female rats.** *Physiological Psychology*, 1974(Jun), Vol

2(2), 187-196.—Compared 7 male and 7 female hooded rats having hippocampal lesions with 28 controls as to activity, body weight, performance on a differential enforcement of low rates (DRL) schedule, and extinction. Normal females acquired the DRL schedule faster than normal males. For both sexes, hippocampal lesions resulted in poor DRL performance and more responses during extinction. Male Ss with hippocampal lesions were further below their target-deprived weight each day than their controls. Sex-lesion interactions were found for activity in the operant chamber during DRL performance and extinction: females with hippocampal lesions were more active and made more responses during extinction than males with hippocampal lesions. Corticosterone levels were manipulated prior to DRL sessions, and resting and stress levels of corticosterone were measured at the end of the experiment. While females had higher corticosterone levels than males, brain lesions did not affect corticosterone levels, nor did hormone manipulations affect DRL performance for either sex. (49 ref)—*Journal abstract*.

4645. Kelley, Diana L. & Mountford, Damon. (U Kansas) **The motivational consequences of cholinergic stimulation of the medial septal area.** *Physiological Psychology*, 1974(Jun), Vol 2(2), 101-103.—Tested the hypothesis that cholinergic thirst demonstrates motivational properties of normal thirst. 12 albino rats served as Ss. Direct application of carbachol to the medial septal area of satiated rats produced large significant increases in drinking. Histamine produced a small and inconsistent increase in drinking, and isoproterenol produced an inconsistent decrease in eating. Carbachol-stimulated Ss performed significantly better on a brightness discrimination task than satiated controls, as measured by running and starting speeds, but did not differ from controls in number of correct choices.—*Journal abstract*.

4646. Kemble, Ernest D. (U Minnesota, Morris) **Drive discrimination in rats following amygdaloid lesions.** *Physiological Psychology*, 1974(Sep), Vol 2(3-A), 320-322.—7 amygdaloid-lesioned and 8 control, male Holtzman albino rats were compared on their ability to utilize hunger- and thirst-related cues to guide positional responses in a T maze. Amygdaloid Ss performed quite accurately when responding to hunger-related cues but were deficient when responding to thirst-related cues. This difficulty was mirrored by increased amygdaloid vicarious trial-and-error behavior on water-deprivation, but not food-deprivation, trials. It is suggested that the amygdaloid lesions either reduced the effectiveness of the water reward or reduced S's ability to employ thirst-related stimuli to guide positional responses.—*Journal abstract*.

4647. Kesner, Raymond P. & Conner, Hubert S. (U Utah) **Cue-dependent recovery from ECS-induced amnesia: Evidence for time dependence.** *Physiological Psychology*, 1974(Jun), Vol 2(2), 123-125.—Tested the differential effectiveness of reminder cues, introduced at staggered times after footshock (FS), in reinstating memory after electroconvulsive shock (ECS). 24 hrs after the administration of FS followed 4 or 256 sec later by ECS, 45 hooded rats exhibited amnesia for the aversive experience. They were then given a reminder cue (tone), which was earlier paired as a conditioned stimulus with

FS. Presentation of the tone resulted in attenuation of the amnesic effect in FS-ECS 256-sec delay group but failed to alter the amnesic effect in FS-ECS 4-sec delay group. Results are interpreted as supporting a memory consolidation hypothesis which states that ECS does not destroy critical traces; rather, it blocks further processing.—*Journal abstract.*

4648. Kirkby, Robert J. & Polgar, Stephen. (Coll of Paramedical Studies, Glebe, NSW, Australia) **Active avoidance in the laboratory rat following lesions of the dorsal or ventral caudate nucleus.** *Physiological Psychology*, 1974(Sep), Vol 2(3-A), 301-306.—Active avoidance learning in a total of 67 male Wistar rats with lesions of the ventral or dorsal caudate nucleus was investigated in 1-way (Exps I and II) and 2-way (Exp III) avoidance situations. Performance was measured under various levels of shock and conditions of food deprivation. G. Winocur and J. A. Mills (see PA, Vol 43:13802) hypothesized that the learning of active avoidance problems was disrupted by lesions of the ventral aspect of the caudate nucleus but not by dorsal lesions. In the present study, Ss with lesions of the ventral caudate were not more deficient than Ss with lesions of the dorsal caudate in learning to avoid. Under some conditions, dorsal-lesion Ss were significantly more impaired than ventral lesion Ss. Findings suggest that the Winocur and Mills hypothesis should be rejected. (26 ref)—*Journal abstract.*

4649. Kolb, Bryan & Nonneman, Arthur J. (Pennsylvania State U) **Frontolimbic lesions and social behavior in the rat.** *Physiology & Behavior*, 1974(Nov), Vol 13(5), 637-643.—The social behavior of 40 male Wistar albino rats with chronic lesions to the medial frontal cortex, orbital frontal cortex, hippocampus, septum, or amygdala was studied in 4 different situations: large open field, small open field, shock-induced aggression, and muricide. All lesions altered social behavior, but the effects of the different lesions could be dissociated from one another and from the behavior of the 16 controls. Lesions to the hippocampus dramatically reduced contact in open field tests and almost totally eliminated shock-induced aggression. Lesions to the amygdala and septum also reduced the level of shock-induced aggression, but whereas amygdala lesions significantly decreased contact, septal lesions did not. Ss with lesions to the medial or orbital aspects of the prefrontal cortex differed from one another; Ss with orbital lesions exhibited consistently low contact scores and Ss with medial lesions did not, while both groups showed increased levels of shock-induced aggression. None of the lesions significantly altered muricide. (21 ref)—*Journal abstract.*

4650. Kovács, Gábor L.; Gajári, Irene; Telegdy, Gyula & Lissák, Kálmán. (U Medical School, Inst of Physiology, Pécs, Hungary) **Effect of melatonin and pinealectomy on avoidance and exploratory activity in the rat.** *Physiology & Behavior*, 1974(Sep), Vol 13(3), 349-355.—In a study with R-Amsterdam albino rats, it was found that a daily dose of 50 µg of melatonin facilitated the extinction of active avoidance reflex and decreased the intertrial activity during extinction. However, it had no effect on learning and intertrial activity during acquisition. Pinealectomy was ineffective on acquisition, extinction,

and intertrial activity. Melatonin (100 µg) given on 2 consecutive days facilitated the passive avoidance behavior in water-deprived Ss in 2 different experimental situations. 50 µg of melatonin or pinealectomy was without effect on passive avoidance behavior. Neither melatonin nor pinealectomy had any influence on water intake or on exploratory activity.—*Journal abstract.*

4651. Kraly, F. Scott & Blass, Elliott M. (Johns Hopkins U) **Motivated feeding in the absence of glucoprivic control of feeding in rats.** *Journal of Comparative & Physiological Psychology*, 1974(Nov), Vol 87(5), 801-807.—Feeding to decreased intracellular glucose utilization was assessed in 13 Sherman female albino rats with bilateral damage to the medial forebrain bundle and in 7 normal rats. Brain-damaged Ss that did not feed to glucoprivation, those that ate normally to glucoprivation, and normal Ss were tested on 3 traditional indices of food-motivated behavior: quinine adulteration of diet, barpressing on a variable-interval schedule of 30 sec, and barpressing on a schedule with a progressive ratio of 2.4 of the 7 brain-damaged Ss that did not eat to glucoprivation performed like normal Ss on all 3 motivational indices, while all 7 performed normally on at least 2 of the 3. Results support the conclusion that the glucoprivic mechanisms is not necessary for the occurrence of normal food-motivated behavior. (16 ref)—*Journal abstract.*

4654. Mah, C. J. & Albert, D. J. (U British Columbia, Vancouver, Canada) **The attenuation of ECS-induced amnesia by reestablishing continuity with the training environment: A further examination.** *Physiological Psychology*, 1974(Sep), Vol 2(3-A), 357-359.—47 male black-hooded rats were given a footshock immediately following a step-through response in a 1-trial passive avoidance task. An electroconvulsive shock (ECS) or a sham treatment was then administered 1 sec after the footshock. A retention test 24 hrs later showed that ECS produced substantial amnesia. However, if the Ss were allowed to recover for 15 min in the training apparatus immediately following the ECS instead of being returned to their home cages, the retention interference produced by ECS was largely reversed. This reversal of ECS-induced amnesia was time-dependent, as Ss placed back into the apparatus after 15 min instead of immediately following ECS did not show an attenuation of amnesia. When recovery from ECS was in the apparatus, the retention of avoidance response was still significantly less than that of controls not given ECS. Results are interpreted in terms of a reactivation of consolidation by an interaction of short-term memory and the cues of the training environment.—*Journal abstract.*

4655. Marshall, John F.; Richardson, J. Steven & Teitelbaum, Philip. (U Pittsburg, Psychobiology Program) **Nigrostriatal bundle damage and the lateral hypothalamic syndrome.** *Journal of Comparative &*

*Physiological Psychology*, 1974(Nov), Vol 87(5), 808-830. —Compared the deficits following nigrostriatal bundle damage with the impairments seen after lateral hypothalamic electrocoagulation in 83 Sprague-Dawley or Carworth rats. Results show that bilateral 6-hydroxydopamine injections into the nigrostriatal bundle, at the level of the substantia nigra or globus pallidus, produced a syndrome of feeding impairments similar to that seen after lateral hypothalamic electrocoagulation. Ss became aphagic and adipsic, progressed through the same stages as in the lateral hypothalamic syndrome, and showed the same persistent deficits in response to regulatory challenges. However, these Ss were somewhat less finicky to the taste of their diet than lateral hypothalamic Ss. Sensorimotor impairments—akinesia, limb dysfunction and rigidity, and impairments in orientation to sensory stimuli—seemed to contribute to several aspects of the feeding deficits. Like lateral hypothalamic Ss, these animals had persistent motivational and regulatory deficits in feeding and drinking which could not be attributed to their sensorimotor disturbances. (53 ref) —*Journal abstract*.

4656. Maser, Jack D.; Dienst, F. T. & O'Neal, Edgar C. (Tulane U) **The acquisition of a Pavlovian conditioned response in septally damaged rabbits: Role of a competing response.** *Physiological Psychology*, 1974(Jun), Vol 2(2), 133-136.—Enhanced acquisition of a classically conditioned eyelid-closure response (to tone and shock) was found following septal injury in 6 rabbits. Eye-opening behavior was 4 times more frequent in 6 control Ss. This suggests that faster acquisition is a function of fewer competing responses which might interfere with elaboration of the conditioned response. (22 ref)

4657. Max, David M.; Cohen, Edna & Lieblch, Israel. (Hebrew U, Jerusalem, Israel) **Effects of capture procedures on emotionality scores in rats with septal lesions.** *Physiology & Behavior*, 1974(Nov), Vol 13(5), 617-620.—18 septal-lesioned albino rats, when approached from below (anterior-ventral capture) rather than from above, displayed a remarkably reduced emotionality score as measured by standard scales, compared with 6 sham-operated controls. Vocalization and biting were almost completely absent, resistance to capture and handling were considerably reduced, and head jerk and vibrissae stiffening were only slightly affected. It is suggested that the septum might be involved in higher order processing of information and that the increased emotionality observed after septal lesioning results from a distorted evaluation of the threat value of sensory input. (15 ref)—*Journal abstract*.

4658. Misantone, Louis J. & Stelzner, Dennis J. (State U New York, Upstate Medical Ctr, Syracuse) **Behavioral manifestations of competition of retinal endings for sites in doubly innervated frog optic tectum.** *Experimental Neurology*, 1974(Nov), Vol 45(2), 364-376.—In 3 groups of frogs ( $N = 33$ ) the optic nerve was induced to innervate the ipsilateral optic tectum with or without the original innervation present. Visual striking responses to mealworms in the inferior visual field were observed postoperatively. Ss in all 3 groups eventually evidenced striking appropriate to the point of the visual field stimulated, but misdirected to the opposite field. These

mirror-image responses were first elicited in nasal field positions and spread over time to temporal field positions. The 1st indications of mirror-image responding in Ss with doubly innervated tecta were seen at later postoperative times than in Ss with only ipsilateral connections. This delayed onset of mirror-image behavior is taken as evidence of competition for synaptic sites. (27 ref)—*Journal abstract*.

4659. Miyata, T. et al. (Kumamoto U, Faculty of Pharmaceutical Sciences, Japan) **Effects of intracerebral administration of piperidine on EEG and behavior.** *Life Sciences*, 1974(Sep), Vol 15(6), 1135-1152.—Effects of intracerebral administration of piperidine, a normal constituent of the mammalian brain, on EEG and behavior were examined in more than 50 freely moving adult cats. Results show that (a) administration into hippocampus or amygdalae caused resting and calmness in small doses and seizure discharge accompanied by hyperemotionality in large doses, (b) administration into pontine reticular formation induced slow-wave and fast-wave sleep, and (c) administration into cerebellum caused remarkable changes in the extrapyramidal function. Findings seem to support the suggestion that piperidine affects neural mechanisms serving regulation of emotional behavior, sleeping, and extrapyramidal function. (29 ref)—*Journal abstract*.

4660. Munson, John B. **Dissociation of slow potentials and phasic multiple unit activity.** *Electroencephalography & Clinical Neurophysiology*, 1974(Sep), Vol 37(3), 314-316.—Reports that optic neurotomy in 3 cats with chronically implanted electrodes had the following effects during REM sleep: (a) eye movement-correlated slow potentials in the lateral geniculate nuclei (LGN) were diminished while those in visual cortex were augmented in amplitude, (b) eye movement-correlated phasic peaks of integrated multiple unit activity in LGN and visual cortex were unchanged, and (c) background levels of integrated multiple unit activity in these sites were diminished. This dissociation of these normally concurrent electrophysiological events provides evidence concerning the electrophysiological basis of these activities and dictates that although the 2 activities co-occur in normal animals, they may not be treated as equivalent. (French summary)—*Journal summary*.

4661. Nakahama, Hiroshi; Yamamoto, Mitsuaki; Sakurada, Shinobu & Shima, Keisetsu. (Tohoku U, Medical School, Inst of Brain Diseases, Japan) **Effects of cytidine diphosphate choline on the nervous system in cats.** *Experimental Neurology*, 1974(Nov), Vol 45(2), 220-227.—Used 30 adult cats to study the effect of cytidine diphosphate choline (CDP-choline) on the nervous system. Almost immediately after intraventricular administration of not less than .2 mg/kg of CDP-choline, Ss exhibited EEG and behavioral arousal; .8 mg/kg induced arousal and continuous crying. Administration of 10 mg/kg resulted in continuous intense crying and pronounced tachypnea; these effects lasted for 1-2 hrs. Immediately after lumbar intrathecal administration of not less than 2.0-4.0 mg/kg CDP-choline, EEG and behavioral arousal occurred and lasted over 8 min. Administration of 10-20 mg/kg caused hyperreflexia, and Ss bit the caudal region of the body. Applied

superficially on the cerebral somatic sensory area I, CDP-choline potentiated the postsynaptic component of the potential evoked by ventrobasal thalamic stimulation; the presynaptic component remained unchanged. Direct application of CDP-choline to nerve fibers produced spontaneous impulse activity. Results suggest that CDP-choline exhibits marked excitatory effects on the nervous system and that it acts directly upon synapses as well as upon nerve fibers.—*Journal abstract.*

4662. O'Hara, Michael P. & Dyer, Robert S. (U Georgia) **Locomotor exploratory activity in blind and normal guinea pigs.** *Physiology & Behavior*, 1974(Nov), Vol 13(5), 701-702.

4663. Overmier, J. Bruce & Gross, Douglas. (U Minnesota) **Effects of telencephalic ablation upon nest-building and avoidance behaviors in East African mouthbreeding fish, *Tilapia mossambica*.** *Behavioral Biology*, 1974(Oct), Vol 12(2), 211-222.—The nest-digging activity of 7 decerebrated and 6 sham-operated male fish was compared pre- and postoperatively. It was found that ablation markedly reduced the nest-digging activity. These results, together with earlier research on *Tilapia macrocephala*, indicate that extensive forebrain ablation depresses all reproductive-cycle behaviors regardless of their closeness to spawning. The same fish were also compared in their postoperative acquisition of an instrumental avoidance response. Ablation again markedly impaired avoidance-learning ability, increasing the observed species generality of this ablation-produced deficit. Comparisons from both experiments failed to show any high degree of concordance among extent of ablation, reduction in nest-digging, and impairment of avoidance learning. (21 ref)—*Journal abstract.*

4664. Peters, Ronald H. & Sensenig, Larry D. (Iowa State U) **Temporal analysis of appetitive behavior following VMH lesions in conscious rats.** *Physiological Psychology*, 1974(Jun), Vol 2(2), 181-183.—Describes a technique for making stereotaxic lesions in the conscious rat in order to study the time course of lesion effects. The ventromedial hypothalamus (VMH) was electrolytically destroyed in 18 conscious, sated female hooded rats. Operant responding for food reward on an FR-5 (fixed ratio) reinforcement schedule increased 2 hrs after the lesions were produced. Performance during the hour immediately following the lesions was not affected.—*Journal abstract.*

4665. Petit, Ted L. & Thompson, Robert. (U Florida) **Nucleus cuneiformis lesions: Amnesic effects on visual pattern discrimination in the rat.** *Physiological Psychology*, 1974(Jun), Vol 2(2), 126-132.—Trained 38 rats with shock avoidance on brightness and pattern discriminations following removal of the left posterior half of the neocortex. Electrolytic lesions of the rostral and basolateral portions of the nucleus cuneiformis of the mesencephalic reticular formation on the right side caused serious retention losses of the pattern problem, while lesions of similar magnitude to other brain stem areas on the right side did not lead to significant impairments in retention. Ss subjected to transverse lateral midbrain knife-cuts showed a slight but significant loss in retention. Results are interpreted as supporting the view that an occipitoreticular pathway is

necessary for the performance of pattern discrimination problems in the albino rat. (16 ref)—*Journal abstract.*

4666. Porter, Joseph H.; Allen, Joseph D. & Arazie, Rachele. (U Georgia) **Reinforcement frequency and body weight as determinants of motivated performance in hypothalamic hyperphagic rats.** *Physiology & Behavior*, 1974(Nov), Vol 13(5), 627-632.—8 obese and 8 nonobese, ventromedial hypothalamus (VMH) lesioned, female Charles River albino rats were tested on a series of increasing variable-interval schedules (.25-4.0 min). Response rates decreased as a function of increases in interreinforcement interval for all groups, and the functions did not differ in form or in slope between the groups. Response rates for the nonobese VMH, 9 lesion control, and 11 normal control Ss were similar, while response rates for the obese VMH Ss were significantly less than those of the others. This reduction in work output by the obese VMH Ss was attributed solely to their increased weight at the time of testing. (23 ref)—*Journal abstract.*

4667. Rausch, Lyle J. & Long, Charles J. (U California, Medical School, Los Angeles) **Habenular lesions and avoidance learning deficits in albino rats.** *Physiological Psychology*, 1974(Sep), Vol 2(3-A), 352-356.—34 Holtzman albino rats were given either habenular lesions or control operations and were evaluated post-surgically during 1-way active avoidance and passive avoidance training. Ss with habenular lesions, particularly those with damage in the posterior aspects of the habenular complex, were significantly impaired during acquisition of the active avoidance task. No significant differences existed between the 2 groups on either of 2 passive avoidance measures. Results are discussed in conjunction with the findings of other research, and hypotheses of either reduced fearfulness or impairment in motor inhibition mechanisms are suggested as frameworks for future research. (21 ref)—*Journal abstract.*

4668. Rausch, Lyle J. & Long, Charles J. (U California, Medical School, Los Angeles) **Habenular lesions and discrimination responding to olfactory and visual stimuli.** *Physiology & Behavior*, 1974(Sep), Vol 13(3), 357-364.—20 male albino Sprague-Dawley rats with either bilateral habenular lesions or sham operations were trained to discriminate on the basis of olfactory cues between 2 compartments of a Grice apparatus modified for odor presentation. The discriminative stimulus consisted of different relative concentrations of the odor substance Linal ranging from .1% to 10% air-diluted concentrations. Ss were initially trained using a 10% relative odor stimulus and subsequently tested with a descending series of odorant concentrations. All except 1 S acquired the initial discrimination, but successive lowering of the odor concentration disrupted the performance of the experimental group while all controls successfully reached criterion at the lowest concentration used. The S failing to make the initial odor discrimination was able to discriminate between the 2 compartments when a visual cue was substituted for the olfactory stimulus. It is concluded that the habenular area serves as an important link between olfactory sensory input and motor systems in the rat. It appears that the behavioral changes observed

are related more to threshold elevation or an impairment in olfactory integration than to generalized disruption of response inhibition mechanisms. (23 ref)—*Journal abstract*.

4669. Sadowski, Bogdan. (Polish Academy of Sciences Medical Research Ctr, Lab of Applied Physiology, Warsaw) **Negativism to food during self-stimulation in the anterior part of the basal forebrain in dogs.** *Physiology & Behavior*, 1974(Nov), Vol 13(5), 645-651. —A negative response to food was found in 7 electrode-implanted dogs self-stimulating in 8 loci within the nucleus entopeduncularis, nuclear commissurae anterioris, the preoptic area, and the lateral hypothalamus. In 6 Ss this appeared simultaneously in 3 forms: (a) ignoring food (FI) during self-stimulation; (b) food rejection (FR, i.e., interruption of the animal's attempt to reach meat upon experimenter-exerted stimulation of the rewarding site), and (c) food ejection (FE) consisting of throwing a piece of meat out of the mouth when the current was switched on at the beginning of the consummatory act. The 7th S displayed an approach-avoidance behavior, and only FI and FR were observed. None of the 3 forms of negativism to food was seen in 2 other dogs self-stimulating in 3 sites. Negative response to food, particularly when it appears as FE, may indicate that the rewarding value of the stimulus depends on excitation of the neural system controlling satiety. (17 ref)—*Journal abstract*.

4670. Sembello, W. J. & Gladfelter, W. E. (West Virginia U, Medical Ctr) **Effect of hypothalamic lesions on the treadmill performance of rats.** *Physiology & Behavior*, 1974(Nov), Vol 13(5), 603-607. —Performed experiments to determine whether 28 male Sprague-Dawley rats whose spontaneous locomotor activity had been decreased by the placement of bilateral electrolytic lesions in the tuber cinereum of the hypothalamus could be forced to run on a treadmill. All Ss with small medial lesions, some Ss with large medial lesions, and most Ss with lateral lesions needed no more prodding to run on the treadmill than they needed before receiving their lesions. While some Ss with large medial lesions and some with lateral lesions usually needed more prodding to keep them running, they, nevertheless, were able to run on the treadmill; in fact, most of these Ss occasionally ran as well as did the 21 controls. Only 1 S, an S with large medial lesions, refused to run. Data suggest that a lack of ability to run cannot explain the hypoactivity observed in these Ss.—*Journal abstract*.

4671. Sleck, Michael H.; Baumbach, H. Dale; Gordon, Barry L. & Turner, Jeffrey F. (U California, Riverside) **Changes in spontaneous, odor modulated and shock induced behavior patterns following discrete olfactory system lesions.** *Physiology & Behavior*, 1974(Sep), Vol 13(3), 427-439. —Preoperatively matched 3 groups of male hooded rats ( $N = 39$ ). Ss received sham operations, bilaterally lateral olfactory tract lesions or anterior olfactory nucleus-anterior commissure lesions. In 1 experiment, spontaneous behavior patterns emitted in an exploration field containing different odors were quantified during satiated and food-deprived conditions. In other experiments, flinch and jump thresholds to electric shock and running patterns in an appetitively motivated straight alley experiment were measured. All lesioned Ss

were hyperactive and typically froze and groomed less than shams, while sniffing and rearing patterns differentiated the lesioned and sham groups in several ways. All Ss had similar flinch and jump thresholds and also emitted similar types of responses to electric shock. In the straight alley, odors from normal and stressed Ss had little effect on the running time of the experimental Ss, while a faint cat odor strongly inhibited sham running behavior. Responses to a novel chemical odor (trimethylpentane) and to changes in the alley floor or electric shock applied to the floor were minimal in all Ss. Results are discussed in terms of other olfactory system lesions and some evidence separating the effects of olfactory cues from nonolfactory lesion effects is presented. Problems associated with tests for olfactory discrimination are discussed. A need for more rigorous and specific discrimination tests in behavioral studies involving anosmia is emphasized. (29 ref)—*Journal abstract*.

4672. Silva, M. Teresa. (Escola Paulista de Medicina, São Paulo, Brazil) **Effects of adrenal demedullation and adrenalectomy on an active avoidance response of rats.** *Physiological Psychology*, 1974(Jun), Vol 2(2), 171-174. —Studied extinction of a 1-way avoidance response in adrenalectomized, adrenal demedullated, and operated control albino male rats. The response was acquired under .3-, .6-, or 1.0-mA shock stimulation. In general, adrenalectomized Ss were slower to extinguish than either the demedullated or the operated control Ss. In the most stressful acquisition condition (1.0 mA), demedullated Ss were as resistant to extinction as adrenalectomized Ss. The relationship of these results to the possible involvement of the pituitary-adrenal system in fear-motivated behavior is discussed. (28 ref)—*Journal abstract*.

4673. Singh, H. K.; Ott, T. & Matthies, H. (Medizinischen Akademie Magdeburg, Inst für Pharmakologie und Toxikologie, E Germany) **Effect of intrahippocampal injection of atropine on different phases of a learning experiment.** *Psychopharmacologia*, 1974, Vol 38(3), 247-258. —Observed the effect of an intrahippocampal injection of the muscarinolytic atropine on acquisition, consolidation, and extinction in 42 male Wistar rats. Ss were trained for a shock-motivated brightness discrimination in a semiautomatic Y maze. The training was nonstop and continued till the Ss reached the training criterion of performing 10 consecutive runs correctly. Pretraining application of atropine impaired learning ability significantly but produced a considerable improvement of retention as compared to the controls. The posttraining application of the same dose also produced a considerable improvement of retention. When atropine was given 1 min before the 1st extinction test, no significant effect was observed. It is assumed that atropine has 2 distinct effects: an aversive effect on short-term memory-related processes and a positive effect on consolidation. It is concluded that atropine's effects on learning may be due to changes occurring in cholinergic neuronal activity of the hippocampus during training. (49 ref)—*Journal abstract*.

4674. Sterman, M. B.; McGinty, D. J. & Iwamura, Y. (VA Hosp, Sepulveda, CA) **Modulation of trigeminal reflexes during the REM state in brain transected cats.** *Archives Italiennes de Biologie*, 1974(Jul), Vol 112(3),

278-297.—Studied the monosynaptic masseteric reflex and the polysynaptic digastric reflex during the REM state, as a function of different levels of transection of the brain stem in 16 cats. After transection at or below the midmesencephalon, or after forebrain aspiration above the basal forebrain, reflex depression was seen as in intact adult animals. With transection between midmesencephalon and midhypothalamus, masseteric reflex facilitation was seen, while digastric reflex depression remained. Reflex depression in REM depends on structures in the rostral pons; mesodiencephalic systems may produce an overriding facilitation, unless checked by basal forebrain influences. Young kittens exhibit reflex facilitation in REM and thus may possess a motor organization similar to that of transected animals that show a similar facilitation.—*W. A. Wilson.*

4675. **Sturgeon, R. David & Levitt, Robert A.** (Tennessee A&I State U) **Angiotensin-induced drinking in the cat: A neuroanatomical analysis.** *Physiological Psychology*, 1974(Jun), Vol 2(2), 197-200.—Drinking was elicited by microinjection of angiotensin-II throughout the medial regions of the brains of 20 cats. At many of these same sites, a hypertonic sodium chloride solution also elicited drinking, as did a 5-ion solution and serotonin, on occasion. However, these other solutions were almost invariably effective only at angiotensin-drinking sites. Diffusion via the ventricular or circulatory system may account for some of these data. (18 ref)—*Journal abstract.*

4676. **Thor, Donald H.; Ghiselli, William B. & Lambelet, David C.** (Edward R. Johnstone Training & Research Ctr, Bordentown, NJ) **Sensory control of shock-elicited fighting in rats.** *Physiology & Behavior*, 1974(Nov), Vol 13(5), 683-686.—Results of 2 experiments with a total of 112 male Long-Evans rats implicate intact vibrissal organs as requisite for normal shock-elicited fighting in paired males and may convey the principal sensory information contributing to conspecific intermale aggression. Anesthesia of the vibrissal pad prior to each paired footshock exposure completely blocked the attack behavior of experimentally naive Ss. Suppression of fighting was effective in all pairs tested over 14 daily sessions. Devibrissated pairs also fought less than controls but gradually attained normal levels of fighting in spite of repeated clipping of all vibrissae to prevent significant regrowth. Findings demonstrate an evident behavioral distinction between anesthesia of the vibrissal pad and removal of the vibrissae. General epidermal sensation from the snout appears to be necessary for initiating social fighting between paired males exposed to irritable shock. (18 ref)—*Journal abstract.*

4677. **Thorne, Michael B.; Aaron, Michael & Latham, Edward E.** (Mississippi State U) **Olfactory system damage in rats and emotional, muricidal, and rat pup killing behavior.** *Physiological Psychology*, 1974(Jun), Vol 2(2), 157-163.—Subjected hooded female rats to a variety of olfactory-system lesions and compared them with septally damaged and operated-control Ss in terms of handling characteristics, muricidal behavior, and behavior toward rat pups. Damage to the olfactory bulb rostral to the frontal poles resulted in increased mouse killing without changes in E-directed behavior. Addition-

al damage under the frontal lobes increased both emotional behavior and mouse killing. Olfactory tubercle damage unaccompanied by olfactory bulb removal failed to produce either increased emotionality or mouse killing. A trend toward an increase in rat pup killing was noted in rats sustaining olfactory bulb damage. Rats with septal damage, although extremely difficult to handle, did not display increased muricidal behavior. (17 ref)—*Journal abstract.*

4678. **Vrtunski, Predrag & Gluck, Henry.** (Cleveland Psychiatric Inst, Research Div, OH) **Duration variability of the intracranially reinforced barpressing response in the rat.** *Physiological Psychology*, 1974(Jun), Vol 2(2), 137-142.—Examined the intracranially reinforced (ICR) response duration in the albino rat. 22 Ss were implanted with hypothalamic stimulating electrodes; 4 others had electrodes in the septal rewarding area, and 6 in the cortex. Ss were divided into 6 groups. Each group was trained to barpress with a different reinforcement schedule. Results indicate that the response was highly sensitive to various stimulus conditions. The variability and scope of response duration suggested a role of centrally generated feedback in the emission of the barpress. An attempt is made to interpret the data according to a model of information processing, without reference to so-called motivational and reinforcing properties of the ICR stimulus. (24 ref)—*Journal abstract.*

4679. **Wampler, Richard S. & Gier, Herschel T.** (Purdue U, Ft Wayne) **Continuing gonadal function in rats with ventromedial hypothalamic area lesions.** *Journal of Comparative & Physiological Psychology*, 1974(Nov), Vol 87(5), 831-840.—Gonads of 24 female and 20 male rats with ventromedial hypothalamic (VMH) or sham lesions were examined after 67 days in constant light. Results show that VMH- and sham-lesioned males had normal testes. Sham-lesioned females had small ovaries and no corpora lutea (CL). 7 VMH females had larger ovaries with CL and numerous follicles, 4 had larger ovaries with no CL but numerous follicles, and 4 had ovaries resembling those of sham-lesioned females. Damage was confined to the VMH in females with CL, but it included less or more of the anterior hypothalamus in females lacking CL. Results suggest that since VMH damage permits estrous cycling to continue, the intact VMH acts to inhibit cycling in constant light. (30 ref)—*Journal abstract.*

4680. **Whishaw, Ian Q.** (U Lethbridge, Alberta, Canada) **Light avoidance in normal rats and rats with primary visual system lesions.** *Physiological Psychology*, 1974(Jun), Vol 2(2), 143-147.—Examined the light-avoidance behavior of 100 normal hooded rats and rats with primary visual system lesions in a differentially illuminated 2-choice chamber for 28-58 days. Normal Ss ate in the dark compartment, hoarded food to the dark, but defecated in the lighted compartment. Enucleation abolished light avoidance and the other behaviors. Neither small nor large posterior neocortex lesions affected light avoidance or other behaviors. Avoidance was also unchanged following superior colliculus lesions and pretectal lesions, but was increased by lateral geniculate lesions, posterior thalamus lesions, combined posterior neocortex and hippocampal lesions, and

posterior neocortex and superior colliculus lesions. Results do not support previous suggestions that primary optic-center lesions decrease light avoidance in the rat. (25 ref)—*Journal abstract*.

4681. Wolfarth, S.; Dulski, E. & Lacki, M. (Polish Academy of Sciences, Kraków) Comparison of the effects of the intranigral injections of cholinomimetics with systemic injections of the dopamine receptor stimulating and blocking agents in the rabbit. *Neuropharmacology*, 1974(Sep), Vol 13(9), 867-875.—The cholinergic stimulation of the substantia nigra of 25 White Danish rabbits, induced by intranigral injections of acetylcholine, methacholine, or neostigmine, produced behavioral and EEG alerting, various forms of stereotyped behavior, and autonomic symptoms, followed by a pre-epileptic EEG pattern and an epileptic EEG pattern accompanied in most of the cases by clonico-tonic convulsions. The EEG and behavioral effects were similar to those observed after systemic injections of amantadine or apomorphine, although they produced more intensive stereotypy and no convulsions. The effects of cholinomimetics were abolished by intranigral injections of atropine or by subcutaneous injections of spiroperidol. The catalepsy produced by spiroperidol was abolished by intranigral neostigmine injections. The relationship between the cholinergic stimulation of the nigra and dopaminergic stimulation of the striatum is discussed. (30 ref)—*Journal abstract*.

#### Drug Effects

4682. ———. **Ibogaine**. *PharmChem Newsletter*, 1972, Vol 1(2), 3-4.—Presents results of a 1972 analysis of street samples of 40 drugs, including 2 which contained ibogaine. The history, pharmacology, and psychological effects of ibogaine are described.

4683. ———. **Phencyclidine (PCP)**. *PharmChem Newsletter*, 1972, Vol 1(1), 2-3.—Presents the results of an analysis of 30 street samples of drugs originating in the San Francisco area during 1972. A report on the pharmacology, history, effects, and metabolism of phencyclidine (PCP) which apparently is increasing in the illicit drug market is presented.

4684. Adler, R. & Lomazzi, F. (U Berne, Switzerland) Mild analgesics evaluated with the "submaximum effort tourniquet technique": I. The influence of psychological factors on their effect. *Psychopharmacologia*, 1974, Vol 38(4), 351-356.—Assessed the effects of placebo, C-44'328-Ba (3-dimethylaminoethyl 1,2-diphenyl-buten 2-ol), and dextropropoxyphen using the submaximum effort tourniquet test by G. M. Smith et al (1966) as a test of experimental pain in 30 normal male volunteers. No significant differences among drug treatments were observed, although when psychological factors (i.e., level of anxiety, use of coping behavior to become distracted by pain, and style of relating to E) were taken into account, Ss with low levels of anxiety, low use of coping behaviors, and relaxed manners of relating showed trends toward better discrimination between placebo and analgesics than did their counterparts. In the most calm and most anxious groups, the response to 4 individual trials was significantly different; in the most calm Ss, discrimination occurred between analgesics and placebo, while in the most aroused Ss, discrimination occurred

only between C-44'328-Ba and all other treatments.—*Journal abstract*.

4685. Adler, R.; Gervasi, A.; Holzer, B. & Hemmeler, W. (U Berne, Switzerland) Mild analgesics evaluated with the "submaximum effort tourniquet technique": II. The influence of a tranquillizer on their effect. *Psychopharmacologia*, 1974, Vol 38(4), 357-362.—Conducted a 2nd study to determine if benzocadiene, administered to induce relaxation, would enhance 48 male volunteers ability to discriminate the effects of 2 analgesics (100 mg C-44'328-Ba and 1g acetaminophen) from placebo. In the 1st study by R. Adler and F. Lomazzi (see PA, Vol 53:Issue 3), Ss who demonstrated a calm behavior in the experimentally induced pain situation (using the submaximum effort tourniquet technique) discriminated between 2 mild analgesics better than Ss who exhibited prominent arousal reactions. Results of the present study show that on none of the 4 pain-intensity levels was benzocadiene discriminated from placebo, indicating that it had no analgesic effects. In Ss who did not receive benzocadiene, the 2 analgesics were not discriminated from placebo. The combination of C-44'328-Ba with benzocadiene was more effective than C-44'328-Ba alone on 3 pain levels. Acetaminophen and benzocadiene together were more effective than acetaminophen alone on the highest pain level. The analgesics given alone were significantly more effective in reducing pain on 2 levels than placebo.—*Journal abstract*.

4686. Ahlenius, S. (U Göteborg, Sweden) Effects of L-dopa on conditioned avoidance responding after behavioural suppression by  $\alpha$ -methyltyrosine or reserpine in mice. *Neuropharmacology*, 1974(Aug), Vol 13(8), 729-739.—The effects of levodopa on a conditioned avoidance response (CAR) suppressed by  $\alpha$ -methyltyrosine methylester hydrochloride ( $\alpha$ -MT), an inhibitor of the catecholamine synthesis, or by the granular uptake-storage blocking agent, reserpine, were investigated in female NMRI albino mice. It was found that 10 mg/kg of levodopa in conjunction with inhibition of peripheral levodopa decarboxylase could restore the suppression of a CAR induced by  $\alpha$ -MT. A partial antagonism of the suppression induced by reserpine was obtained by levodopa 3-4 hrs after intraperitoneal injection and 2 hrs after 400 mg/kg. In order to test the specificity of response, the performance on a 2-choice CAR was investigated. It was found that the reversal by levodopa after reserpine but not after  $\alpha$ -MT resulted in significant number of false CARs. It may be that a restoration of behavior to predrug level of performance is dependent on an intact granular function ensuring release of catecholamines by nerve impulses on administration of levodopa. (26 ref)—*Journal abstract*.

4687. Alexander, Michael. (Dept of Health, Education & Welfare, Ctr for Disease Control, Atlanta, GA) Surveillance of heroin-related deaths in Atlanta, 1971 to 1973. *JAMA: Journal of the American Medical Association*, 1974(Aug), Vol 229(6), 677-678.—Surveillance of heroin overdose deaths and of the heroin content of glassine bags available at the "street level" in Atlanta in 1971-1973 disclosed a significant correlation between the occurrence of such deaths and the amount of heroin contained in the bags ( $p < .001$ ). Case histories of 1 cluster of deaths suggest that novice users

with a low level of opiate tolerance could have died from intake of amounts of heroin in excess of their tolerance; however, data are also consistent with causes other than pharmacologic overdose.

4688. Anderson, Rebecca J. & Raines, A. (Georgetown U, Medical & Dental School) **Selective diphenylhydantoin suppression of auditory evoked potentials in the cat cerebellar cortex.** *Neuropharmacology*, 1974(Aug), Vol 13(8), 749-754.—Evoked potentials were recorded in Larsell's lobules VI, VIIb, and the left paramedian lobule of the cerebellum in 20 anesthetized adult cats. Diphenylhydantoin reduced auditory responses produced by a 2,800 Hz 60 db tone in all 3 cerebellar areas, 5 mg/kg being below thresholds, and doses of 20 mg/kg or more completely abolishing the response. In addition, cerebellar responses produced by dropping a 10-g weight on the forepaw or stimulation of the ipsilateral superficial radial nerve were resistant to diphenylhydantoin doses as great as 40 mg/kg. Diphenylhydantoin seemed to have no effect on spontaneous cerebellar activity. It is concluded that the selective depression of auditory-evoked cerebellar activity was due to diphenylhydantoin. —*Journal abstract.*

4689. Aporti, Ferrante; Pensato, Anna & Toffano, Gino. [The effect associated with hypothalamic phospholipids and a psychotropic drug used in testing for ulcers due to stress.] (Ital) *Rivista di Psichiatria*, 1973(Nov-Dec), Vol 8(6), 650-659.—Indicates that the administration of phospholipids may regulate efferent sympathetic impulses and normalize the nerve structures altered by hyperstimulation. (25 ref)

4690. Barker, Lewis M.; Suarez, E. Martin & Gray, Don. (Baylor U) **Backward conditioning of taste aversions in rats using cyclophosphamide as the US.** *Physiological Psychology*, 1974(Jun), Vol 2(2), 117-119.—Demonstrated that conditioned taste aversion resulted from an unconditioned stimulus-conditioned stimulus (US-CS)—backward—conditioning procedure using a 75 mg/kg cyclophosphamide injection as the US. 55 female albino rats served as Ss. The magnitude and resistance to extinction of the conditioned taste aversion was found to decrease monotonically when the US-CS interstimulus interval was varied from 1 min to 4 hrs. In this respect, and in the inconclusive nature of the signs of sickness following US administration, cyclophosphamide appears to act like ionizing radiation in conditioning taste aversions. It is argued that these results reflect associative, not pseudoconditioned, avoidance responses. (18 ref)—*Journal abstract.*

4691. Beaton, John M.; Pegram, G. Vernon; Bradley, Ronald J. & Smythies, John R. (U Alabama, Neurosciences Program, Birmingham) **An investigation of the effects of L-methionine and related metabolites on rat behavior.** *Behavioral Biology*, 1974(Oct), Vol 12(2), 249-256.—Tested levomethionine, levoserine, levomethionine plus levoserine, levocysteine, and betaine on a modified discriminated Sidman avoidance schedule with 20 male hooded rats. Daily injections of 250 mg/kg of these compounds were administered to experimental Ss for at least 28 consecutive days. Schedule performance was monitored during this period and compared to that of preinjection saline controls. Results indicate that only methionine had significant behavior-disrupting effects.

The disruption was removed by the addition of serine, suggesting that the methionine-disrupting effect may have been due to one of the metabolites of methionine—homocysteine.—*Journal abstract.*

4692. Bigler, Erin D.; Fleming, Donovan E. & Shearer, Donald E. (Brigham Young U) **Pharmacological modulation of photically evoked afterdischarge patterns in hooded Long-Evans rats.** *Bulletin of the Psychonomic Society*, 1974(Sep), Vol 4(3), 179-181.—Examined photically evoked afterdischarge (AD) patterns within a short-term habituation paradigm in 10 rats. Pharmacological arousal by amphetamine, pilocarpine, and physostigmine or induced thalamic suppression by trimethadione attenuated AD development. AD development was unaffected by saline, methyl atropine, and atropine. Pentylentetrazol was used as an AD potentiator and, as such, enhanced AD development following all drug conditions except within the physostigmine and methyl atropine sessions. All drugs were administered subcutaneously. It was determined that in the hooded rat AD varies only as a function of drug injected; time was not a factor. The role of the reticulocortical projection system and the limbic system is incorporated in the explanation of the results. Significant differences were also noted between the pharmacology of AD parameters in hooded vs albino rats. (18 ref)—*Journal abstract.*

4693. Booth, D. A. & Simson, P. C. (U Birmingham, England) **Taste aversion induced by an histidine-free amino acid load.** *Physiological Psychology*, 1974(Sep), Vol 2(3-A), 349-351.—Protein-free diet flavored with saccharin or salt was presented to 16 male Sprague-Dawley albino rats following a single intragastric administration of a histidine-devoid, but otherwise balanced, amino acid mixture. A control load was paired with the alternate flavor on another day. When Ss were subsequently given a choice of flavors, they preferred the control flavor to the one paired with the deficient load. —*Journal abstract.*

4694. Booth, D. A. (U Birmingham, England) **Acquired sensory preference for protein in diabetic and normal rats.** *Physiological Psychology*, 1974(Sep), Vol 2(3-A), 344-348.—In Exp I male Sprague-Dawley rats made diabetic by injection of streptozotocin, either after adaptation to a cafeteria or some weeks beforehand, increased their intake of protein relative to that of other macronutrients. Preference for an arbitrary odor added to the protein was increased. In Exp II, 8 normal Ss were repeatedly given brief access to either protein-free or protein-containing diet while maintenance chow was withheld for 10 hrs. Ss came to prefer the odor-taste combination included in the protein diet to the flavor included in the protein-free diet. It is suggested that, not only in diabetic and protein-deprived rats, but also in normal rats not long since the end of amino acid absorption, the supply of amino acids establishes a relative conditioned attraction for associated food flavors. (17 ref)—*Journal abstract.*

4695. Boyatzis, Richard E. (McBer & Co, Boston, MA) **The effect of alcohol consumption on the aggressive behavior of men.** *Quarterly Journal of Studies on Alcohol*, 1974(Sep), Vol 35(3-A), 959-972.—Studied the interpersonal aggressive behavior of 149 25-50 yr old male social drinkers during 4-hr sessions with 6-8 Ss

each in which distilled spirits (D), beer (B), or nonalcoholic beverages (N) were consumed. Ss completed an activities questionnaire and participated in competitive activities which were videotaped. D and B Ss were more aggressive than the N Ss throughout the session, and D Ss were more aggressive than either B or N Ss late in the session. At blood alcohol concentrations (BACs) greater than .10%, Ss tended to demonstrate more aggressive behavior than at lower BACs. The aggressive behavior of the drinking Ss correlated well with self-reported frequency of trouble due to drinking and physical fights. (23 ref)—*Journal abstract*.

4696. Braden, William; Stillman, Richard C. & Wyatt, Richard J. (St Elizabeths Hosp, Lab of Clinical Psychopharmacology, Washington, DC) **Effects of marihuana on contingent negative variation and reaction time.** *Archives of General Psychiatry*, 1974(Oct), Vol 31(4), 537-541.—Measured contingent negative variation (CNV) and reaction time in 12 21-26 yr old experienced marihuana users after they smoked placebo and marihuana cigarettes. Change in CNV amplitude after smoking marihuana (9.9 mg of  $\Delta^9$ -tetrahydrocannabinol) was negatively correlated ( $r = -.83$ ) with Ss' ratings of their "high" and not significantly correlated with change in reaction time. Results suggest that the relationship of CNV amplitude to marihuana dose is probably in the form of an inverted U. The CNV amplitude may reflect attentional effort or level of interest rather than efficiency of attentional performance, as measured by reaction time. (27 ref)—*Journal abstract*.

4697. Brown, John L. (U Rochester) **Drug effects on vision: Strategies for study and selected results.** *Human Factors*, 1974(Aug), Vol 16(4), 354-367.—Outlines, from the literature, some of the difficulties associated with the problem of determining drug effects on the visual sensory system. Specific consideration is given to the selection of human and animal Ss for study, the use of electrophysiological techniques, and a variety of experimental procedures which may be employed. Problems associated with the attention and motivation of Ss, the use of anesthesia, and the need for investigation of a wide range of drug dosages are discussed. Experiments which reveal fairly specific effects on visual function are described. (73 ref)—*Journal abstract*.

4698. Carlson, Kristin R. & Pavsek, Marianna. (U Pittsburgh, Medical School) **Effects of oral methadone consumption on visual discrimination of the rhesus monkey.** *Physiological Psychology*, 1974(Sep), Vol 2(3-A), 383-386.—In Exp I 3 male rhesus monkeys which drank small doses, once daily, of methadone mixed with Tang orange drink were trained to perform a series of 2-object visual discrimination problems. Their average number of trials to criterion was the same as that of 5 normal controls, and they made the same number of errors on test trials in which the orientation of the stimulus objects was changed. Ss' average choice latencies, however, were significantly longer than those shown by the normal group. In Exp II the same Ss were given a decision interval to observe the stimulus objects. Latencies, as measured from the end of the interval, were the same for control and methadone-consuming Ss. Data suggest that the previously elevated latencies were not due to motor or motivational lethargy but to a drug-induced prolonga-

tion of the time necessary to decide which was the correct object.—*Journal abstract*.

4699. Cox, T. (U Nottingham, England) **Effects of physostigmine on the accuracy and activity of discrimination behaviour in rats.** *Neuropharmacology*, 1974(Aug), Vol 13(8), 701-705.—The effects of physostigmine on the maintenance of a position discrimination and of a visual discrimination were studied in 2 experiments with 6 male Sprague-Dawley rats in each. Small intraperitoneal doses of the drug improved the accuracy of performance but reduced the Ss' level of activity. Larger doses (above .08 mg/kg) brought about a general disruption of behavior, impairing accuracy of performance as well as markedly reducing level of activity. The dose-response curve for the accuracy measure was significantly different from that for the activity measure, and the increase in difficulty across the 2 discriminations was associated with a shift in the dose-response curves for the 1st but not the 2nd measure. Results support suggestions that the behavioral effects of physostigmine can be explained through its action on 2 separate cholinergic mechanisms of response inhibition. (16 ref)—*Journal abstract*.

4700. Díaz-Flores, L.; Munuera, L.; Rico, J. R. & Vila-Coro, A. (Facultad de Medicina, Madrid, Spain) **[Degeneration of nerve fibre caused by compression of the sciatic nerve in rats treated with parotid extract.]** (Span) *Archivos de Neurobiología*, 1972(May), Vol 35(3), 263-278.—Administered a solution of parotid extract to 25 rats, 21 others serving as controls. The effects on nerve tissue were studied, and significant differences between the 2 groups were found, especially in the connective distal tissue. (23 ref)

4701. Dorus, Elizabeth; Pandey, Ghanshayam N.; Frazer, Alan & Mendels, Joe. (Illinois State Psychiatric Inst, Chicago) **Genetic determinant of lithium ion distribution: I. An in vitro monozygotic-dizygotic twin study.** *Archives of General Psychiatry*, 1974(Oct), Vol 31(4), 463-465.—Assessed red blood cell (RBC) lithium ion concentrations in 10 monozygotic and 7 dizygotic twin pairs after a 24-hr incubation in vitro. A heritability index of .85, calculated as a function of intrapair difference scores, indicated that a substantial genetic factor is operative in RBC intake of lithium ion. (19 ref)

4702. Dowd, Patrick J. **Influence of alcoholic beverages on the vestibulo-ocular responses to coriolis stimulation.** *Quarterly Journal of Studies on Alcohol*, 1974(Sep), Vol 35(3-A), 943-952.—Tested positional nystagmus and vestibulo-ocular response to Coriolis stimulation in 6 experienced airplane pilots (mean age 29.7) before and 8-10 and 34-36 hrs after drinking 1.7 ml of ethanol/kg of body weight as bourbon or vodka. Each S received 6 tilts (Coriolis test) during each test period. In the 8-10 hr period positional alcohol nystagmus (PAN) I was found 4 times and PAN II 8 times; in the 34-36 hr period, 2 and 6 times, respectively. In the left-right tilt, recovery rates were lower and sensitivity and frequency of nystagmus higher 10 hrs after drinking bourbon than before; in the right-left tilt, recovery rates were lower and sensitivity and duration of nystagmus higher. After vodka the recovery rate was lower in the left-right tilt, and in the right-left tilt, frequency and sensitivity were higher. The differences between the effects of bourbon and vodka were not significant. It is

concluded that alcohol weakens the suppression of nystagmic responses to Coriolis acceleration developed by experienced pilots. (19 ref)—*Journal abstract*.

4703. Ehrenwald, Jan. (Roosevelt Hosp, New York, NY) **Placebo: Ploy, psi effect, research tool or psychoactive agent?** *Parapsychology Review*, 1974(Sep-Oct), Vol 5(5), 1-4.—Briefly reviews the history of placebos in medicine and notes that even in modern, tightly controlled triple-blind drug tests, medicinal substances often seem to work for a time and then become ineffective. These results seem to parallel the course of ESP experiments where attitudes of hope and high expectations also produce initial results which eventually decline and become difficult to replicate. It is suggested that a psi factor may be contaminating drug research, and only those remedies which stand the test of time may be free of it. A placebo should not be derided, however, for with authentic motivation a doctor may find it a powerful therapeutic tool.—P. F. Grim.

4704. Elkins, Ralph L. (VA Hosp, Augusta, GA) **Balt-shyness acquisition and resistance to extinction as functions of US exposure prior to conditioning.** *Physiological Psychology*, 1974(Sep), Vol 2(3-A), 341-343.—Cyclophosphamide-induced aversions to saccharin-flavored tap water were observed in 10 normal control Sprague-Dawley rats, in 15 Ss subjected to varying numbers of cyclophosphamide injections prior to conditioning, and in 5 Ss similarly subjected to preconditioning saline injections. Both initial magnitude and resistance to extinction of a conditioned flavor aversion were inverse functions of preconditioning familiarity with drug-induced illness. 6 preconditioning cyclophosphamide injections markedly reduced both initial aversion magnitude and resistance to extinction. In contrast, 3 such injections failed to affect initial aversion magnitude and resulted in a small acceleration of extinction rate, while 1 preconditioning cyclophosphamide injection produced no observable effects. Findings depict preconditioning familiarity with illness as an important variable modulating the strength of conditioned flavor aversions and emphasize the importance of viewing resistance to extinction as an indicator of aversion strength. (17 ref)—*Journal abstract*.

4705. Fernandes, Mario; Schabarek, Ahmed; Coper, Helmut & Hill, Regina. (Freie U Berlin, Inst für Neuropsychopharmakologie, W Germany) **Modification of  $\Delta^1$ -THC-actions by cannabinal and cannabidiol in the rat.** *Psychopharmacologia*, 1974, Vol 38(4), 329-338.—Studied the action of cannabinal (CBN) and cannabidiol (CBD) using several test procedures known to be altered by  $\Delta^1$ -tetrahydrocannabinol (THC) or crude cannabis preparations. In male Wistar rats, CBN and CBD were inactive in doses up to 80 mg/kg in tests on S motility, food and water intake, body temperature and catalepsy. In contrast, CBD enhanced the hexobarbitone sleeping time more than THC, whereas CBN increased the sleeping time only slightly. When administered in combination CBD prolonged all actions of THC, whereas CBN selectively blocked the effect of THC on hexobarbitone sleeping time. The enhancement by CBD is best explained by an inhibition of THC metabolism. (21 ref)—*Journal abstract*.

4706. Frankenhaeuser, Marianne; Dunne, Elizabeth; Bjurström, Hans & Lundberg, Ulf. (U Stockholm, Psychological Lab, Sweden) **Counteracting depressant effects of alcohol by psychological stress.** *Psychopharmacologia*, 1974, Vol 38(4), 271-278.—Examined the interaction between effects of acute alcohol intoxication and psychological stress in 8 male and 8 female 20-30 yr old college students. Alcohol was given as whiskey, 2 ml/kg of body weight to males and 1.7 ml/kg to females. Psychological stress was induced by applying electric shocks of a moderate intensity to one of the S's hands. Performance in reaction-time tasks representing different levels of complexity, self-estimates of wakefulness and mood, measurements of catecholamine excretion and of heart rate were used as indices of the effects caused by alcohol and shock, singly and in combination. Shocks and alcohol had opposite effects, with shocks decreasing and alcohol increasing reaction time. When the Ss were simultaneously exposed to both influences, the impairment produced by alcohol was significantly reduced by shock at all levels of task complexity. No sex differences could be detected. (17 ref)—*Journal abstract*.

4707. Freed, Earl X. (VA Hosp, Alcohol Research Lab, Lyons, NJ) **Fluid selection by rats during schedule-induced polydipsia.** *Quarterly Journal of Studies on Alcohol*, 1974(Sep), Vol 35(3-A), 1035-1043.—Offered water and solutions containing either 5.6% alcohol, 6.05% 1,3-butanediol, or 5.6% acetone for 32 days to 8 male Blue Spruce albino rats during schedule-induced polydipsia. The 3 Ss offered alcohol (Group I) drank 47, 68, and 89% of their daily fluid intake as the alcohol solution, the 2 given butanediol (Group II) drank 92 and 50% as butanediol, and the 3 offered acetone (Group III) drank 3, 16, and 28% as acetone. Random shock, administered for the next 16 days, reduced intake of all fluids but that of alcohol least. After reestablishment of baseline drinking for 20 days, fluid choices were switched for another 20 days. Ss in Group I drank 67, 67, and 68% of their daily intake as butanediol, Group II drank 97% and 71% as butanediol, and Group III drank 2, 81, and 68% as alcohol. Random shock for the next 20 days slightly increased the proportion of alcohol consumption by all Ss. It is concluded that fluid consumption was based on caloric need.—*Journal abstract*.

4708. Fukuda, Sachio & Iwahara, Shinkuro. (Tokyo U of Education, Japan) **Dose effects of chlordiazepoxide upon habituation of open-field behavior in white rats.** *Psychologia: An International Journal of Psychology in the Orient*, 1974(Jun), Vol 17(2), 82-90.—Examined the relationship between drug dose and response in naive male rats observed in an open field for 10 min/day on 6 successive days. Drug-state changes in 2 directions increased ambulation and rearing when chlordiazepoxide dosage was at a relatively low level, but at higher levels these changes occurred in only 1 direction. Correlations between 2 skeletal measures and 2 autonomic measures were very low. Results are presented in detail.—R. D. Nance.

4709. Gamberale, Francesco & Hultengren, May. **Exposure to styrene: II. Psychological functions.** *Work-Environment-Health*, 1974, Vol 11(2), 86-93.—Studied the effect of the solvent styrene on psychological functions (e.g., perceptual speed, reaction time and

manual dexterity) in 12 healthy 21-31 yr old male Ss. Each S was repeatedly studied during exposure to 50, 150, 250, and 350 ppm styrene in inspiratory air and under control conditions. Samples of Ss' alveolar air were taken every other minute during trials. In a subsequent trial parallel samples of alveolar air and arterial blood were taken for 3 Ss. Results show that styrene concentration in alveolar air could not be used as a reliable indicator of the concentration of styrene in arterial blood. A significant impairment in reaction time was observed in exposure to 350 ppm styrene in inspiratory air. Perceptual speed and manual dexterity were not affected by exposure. Results suggest that, in the evaluation of the safety risks connected to exposure to styrene, a special importance must be ascribed to the duration of exposure.—*Journal abstract.*

4710. Gamberale, Francesco & Svensson, Gerd. The effect of anesthetic gases on the psychomotor and perceptual functions of anesthetic nurses. *Work-Environment-Health*, 1974, Vol 11(2), 108-113.—Administered simple and choice reaction time and perceptual speed tasks to 20 25-32 yr old anesthetic nurses and 20 24-34 yr old nurses with duties in intensive care units at the start and at the end of a work day. The anesthetic nurses were exposed to anesthetic gases in their daily work. The duties of the other nurses were carried out in rooms in which the nurses were not exposed to anesthetic gases. No measurable impairment in reaction time and in perceptual speed of the anesthetic nurses, as compared to the intensive care staff, could be detected. Results obtained in 1 of the reaction time tests, however, indicate that the individual variability of the responses of anesthetic nurses was greater than that of the comparison group at the end of the work day but not after 16 hrs of rest from exposure.—*Journal abstract.*

4711. Graf, Curtis L. (State U New York, Stony Brook) Effects of scopolamine on inhibitory mechanisms. *Physiological Psychology*, 1974(Jun), Vol 2(2), 164-170.—Scopolamine-injected hooded rats remained withdrawn from a novel chamber longer than controls under free exploratory conditions (Ss could withdraw into the home cage). This finding was interpreted to mean that scopolamine prevents the habituation of fear induced by the novel chamber. Under forced exploratory conditions (no opportunity to withdraw), scopolamine-injected Ss showed (a) continuous general motor behavior rather than a within-session decrease as found in control Ss; (b) as much within-session decrease in locomotion, scanning, and object contact as controls. Results are interpreted to mean that scopolamine produces a disinhibitory effect on general activity without interfering with behavioral response habituation. The drug's disinhibitory effect on fear and general motor activity may be due to the impairment of an inhibitory cholinergic system within the brain, but this system does not appear to mediate the inhibitory process underlying behavioral response habituation. (25 ref)—*Journal abstract.*

4712. Greizerstein, Hebe B. & Smith, Cedric M. (Research Inst on Alcoholism, Buffalo, NY) Ethanol in goldfish: Effect of prior exposure in a test procedure. *Psychopharmacologia*, 1974, Vol 38(4), 345-349.—Investigated the authors' 1973 finding that goldfish acquire

tolerance to ethanol, to determine whether prior exposure to the test procedure contributed to tolerance development. The actions of ethanol were measured by the time required for the appearance of overturn (loss of righting reflex) and the brain ethanol content at the instant of overturn following immersion of 60 goldfish in 3.1% ethanol. Neither the time required for onset of action nor ethanol brain levels at overturn were significantly affected by 1-5 exposures to the 3.1% solution over an interval of 2-5 days. Findings confirm the use of the overturn test as a behavioral measure relatively uninfluenced by repeated exposure to the test situation.—*Journal abstract.*

4713. Guedry, Fred E.; Gilson, Richard D.; Schroeder, David J. & Collins, William E. Some effects of alcohol on various aspects of oculomotor control. Pensacola, FL: Naval Aerospace Medical Research Lab, with US Army Aeromedical Research Lab, Ft Rucker, AL, & FAA Civil Aeromedical Inst, Oklahoma City, OK, NAMRL-1206 & USAARL 75-2, 1974. 23 p.—Measured performance on 3 tasks (visual suppression of vestibular nystagmus, tracking of a moving target, and repetitive rapid voluntary shifts in gaze) before and after a mild dose of alcohol in 11 male Ss. Oculomotor control was decreased on the 1st 2 tasks with a recovery toward initial performance level 4 hrs after drinking; performance on the 3rd task was not degraded. (23 ref)

4714. Guha, D. & Pradhan, S. N. (Howard U, Medical School) Effects of mescaline,  $\Delta^9$ -tetrahydrocannabinol and pentobarbital on the auditory evoked responses in the cat. *Neuropharmacology*, 1974(Aug), Vol 13(8), 755-762.—Effects of intraperitoneal mescaline,  $\Delta^9$ -tetrahydrocannabinol (THC), and pentobarbital were studied on the peak latency, area, and amplitude of the waves of the average auditory evoked potentials in restrained conscious cats. Mescaline caused a significant increase in peak latency, area, and amplitude of these waves. The onset of these changes was within 10-40 min, and their duration ranged between 90-180 min. THC also caused a marked increase in peak latency, area, and amplitude. The effects of THC had its onset within 40-105 min and lasted for more than 120-180 min. Pentobarbital also caused an increase in the peak latency, area, and amplitude of these waves within 5-7 min. The peak effect occurred within 10-15 min and lasted for more than 100-120 min. These effects of the hallucinogens, mescaline and THC thus appear to resemble those of pentobarbital, a central nervous system depressant; however, the mechanism of their actions differs. (29 ref)—*Journal abstract.*

4715. Harley, J. Preston; Cohen, Rochelle & Silverman, Albert J. (U Wisconsin, Ctr for Health Sciences, Neuropsychology Lab, Madison) Field dependence and response to alcohol. *Quarterly Journal of Studies on Alcohol*, 1974(Sep), Vol 35(3-A), 973-986.—Administered the rod-and-frame test to 30 male 18-30 yr old social drinkers before and 2 hrs after they had consumed drinks with .33 or 1 ml of absolute alcohol/kg of body weight. Ss were divided into 3 groups of 10 Ss each—field dependent (d), field independent (I), and medium field dependent (M). Mean blood alcohol concentrations in the 3 groups were comparable—.020-.025% after the low dose and .089-.094% after

the high dose. D Ss gave more accurate responses after the low dose than I Ss, and all groups were less accurate after the high dose. Respiration, blood pressure, and pulse rate were measured before and at 10-min intervals after drinking; there were no significant respiration changes, but 1.5 hrs after drinking blood pressure increased after the low dose but decreased after the high dose in all groups. Pulse rate did not change in D Ss after either dose but increased in the M and I Ss after the high dose. (27 ref)—*Journal abstract*.

4716. Hartmann, Ernest; Cravens, James & List, Samuel. (Boston State Hosp, MA) **Hypnotic effects of l-tryptophan.** *Archives of General Psychiatry*, 1974(Sep), Vol 31(3), 394-397.—Reports that sleep latency in 10 normal 21-35 yr old males was significantly reduced by bedtime administration of the amino acid levotryptophan. The reduction in sleep latency (approximately 50%) was significant even at a dose of 1 gm of levotryptophan, which approximates the levotryptophan content of .5 kg of meat. EEG stages of sleep and the cycle of sleep were not significantly affected by low doses of levotryptophan but at one or more of the higher doses (10-15 gm) there was a decrease in desynchronized sleep and an increase in slow-wave sleep. (36 ref)—*Journal abstract*.

4717. Heilman, R. D.; Bauer, E. W. & da Vanzo, J. P. (Ortho Research Foundation, Raritan, NJ) **Pharmacologic studies with triflubazam (ORF 8063): A new psychotherapeutic agent.** *Current Therapeutic Research*, 1974(Sep), Vol 16(9), 1022-1032.—ORF-8063, a benzodiazepine derivative with a unique structural modification, produced in mice, cats, and dogs pharmacologic effects that were similar to, and different from, those of chlordiazepoxide and diazepam, respectively. The drug was generally intermediate in potency to chlordiazepoxide and diazepam in motor performance and anticonvulsant and antiaggressive behavior tests in mice and produced minimal cardiovascular and autonomic effects in dogs. It had a larger lethal dose and a considerably longer duration of action than diazepam in mice and produced sedation without presedation excitation in cats. ORF-8063 did not stimulate appetite in dogs at a dose of 2.0 mg/kg administered for 14 consecutive days and produced a slight, antiemetic effect. While the significance of these effects remains to be shown in clinical studies, early clinical studies have shown an anxiolytic effect of ORF-8063. (18 ref)—*Journal abstract*.

4718. Hodge, Gordon K. & Butcher, Larry L. (U California, Los Angeles) **5-Hydroxytryptamine correlates of isolation-induced aggression in mice.** *European Journal of Pharmacology*, 1974(Oct), Vol 28(2), 326-337.—Recorded aggressive behavior in pairs of male Swiss-Webster SIM/WS albino mice, who had been isolated for 4 wks, for 15 min every other day. Drug procedures were begun after the baseline for aggression and activity stabilized. While motility remained unaffected, Ss injected intraperitoneally with 5-hydroxytryptophan in combination with a peripheral decarboxylase inhibitor engaged in fewer fights of shorter average duration which were preceded by longer attack latencies. Biochemical analyses indicated that although serotonin levels were increased, catecholamine levels were reduced. A putative inhibitor of tryptophan hydroxylase, p-

chloro-N-methylamphetamine (PCMA), increased fighting frequency. At time periods in which fighting was increased, levels of brain serotonin were reduced while catecholamine levels remained unaltered. Although PCMA did not affect motility at time intervals when fighting was increased, locomotor activity was increased for the first 8 hrs after administration. Results suggest that serotonergic mechanisms are involved in the control of isolation-induced aggression in mice. (38 ref)—*Journal abstract*.

4719. Horst, W. Dale & Spirt, Nena. (Hoffmann-La Roche Inc, Nutley, NJ) **A possible mechanism for the anti-depressant activity of thyrotropin releasing hormone.** *Life Sciences*, 1974(Sep), Vol 15(6), 1073-1082.—In a series of experiments with male Charles River rats, intraperitoneally injected thyrotropin releasing hormone (TRH) caused an increase in the release and turnover of norepinephrine in brain tissue but had no effect on the endogenous levels of this amine. TRH did not influence the uptake of norepinephrine by brain tissue. It is suggested that the release of norepinephrine by THR may be the mechanism whereby TRH reverses mental depression. (26 ref)—*Journal abstract*.

4720. Houser, Vincent P. & Van Hart, Dale A. (VA Hosp, Psychotropic Drug Lab, Perry Point, MD) **The effect of chlorpromazine and imipramine on the aversive threshold of rats.** *Physiological Psychology*, 1974(Sep), Vol 2(3-A), 333-336.—Assayed the analgesic potency of chlorpromazine (CPZ—.25, 2.0, 4.0, and 8.0 mg/kg) and imipramine (2.5, 5.0, 10.0 and 20.0 mg/kg) in 12 male Sprague-Dawley rats, using the spatial preference technique. CPZ raised the aversive threshold in a dose-dependent manner in doses at or above 2.0 mg/kg. These same dosages, however, also significantly reduced the number of motor responses made during threshold testing. Results suggest that CPZ produces analgesia and/or inhibits the execution of the escape response. Imipramine, on the other hand, significantly raised the aversive threshold without reducing motor activity. These results suggest that imipramine produced an analgesic effect. (20 ref)—*Journal abstract*.

4721. Izquierdo, Ivan. (Farmacologia e Biofisica Inst de Bociencias, Port Alegre, Brazil) **Effect on pseudoconditioning of drugs with known central nervous activity.** *Psychopharmacologia*, 1974, Vol 38(3), 259-266.—Placed 158 female Wistar rats in a conventional shuttle-box and submitted them to buzzers and shocks presented in random sequence and with no temporal association. Ss made pseudoconditioned barrier-crossing responses to the buzzer. The performance of these responses was enhanced by metrazol and trimethadione, depressed by amobarbital, phenobarbital, meprobamate, diazepam, chlorpromazine, and reserpine, and unaffected by diphenylhydantoin, cannabidiol, caffeine, strychnine, picrotoxin, and dibenamine. The enhancing effect of trimethadione, but not that of metrazol, was antagonized by dibenamine. With the exception of metrazol, chlorpromazine, and reserpine, the drug effects on pseudoconditioning did not correlate with those reported for pretrial administration on conditioned avoidance, using the same doses and route of administration (intraperitoneal). Results support the notion that pseudoconditioning is a distinct behavioral entity with pharmacologic

characteristics clearly different from those of avoidance conditioning. (32 ref)—*Journal abstract.*

4722. Kahn, Jeffrey; Gorelick, David A. & Bridger, Wagner H. (Swarthmore Coll) **Mescaline facilitates retention of passive avoidance in rats.** *Physiological Psychology*, 1974(Jun), Vol 2(2), 120-122.—Tested the hypothesis that hallucinogens produce memory disturbance. Of 81 male hooded rats, half were given 1 trial of step-through passive avoidance, then immediately injected with saline or mescaline (160  $\mu$ mol/kg intraperitoneally) and tested for retention 48 hrs later. Controls were given identical treatments, except that they did not receive footshock during the training trial. Groups receiving footshock showed learning and retention, with the mescaline group showing better retention than the saline group. The no-footshock groups showed no learning, with the mescaline group not differing from the saline. In a separate experiment, rats were given 1 trial of step-through passive avoidance, then injected with saline or mescaline 72 hrs later and tested for retention 48 hrs after injection. The mescaline and saline groups did not differ, indicating that mescaline did not have a 48-hr proactive effect on performance in this task.—*Journal abstract.*

4723. Kaplan, J. et al. (NIMH Lab of Clinical Psychopharmacology, St Elizabeths Hosp, Washington, DC) **Blood and urine levels of N,N-dimethyltryptamine following administration of psychoactive dosages to human subjects.** *Psychopharmacologia*, 1974, Vol 38(3), 239-245.—Psychoactive doses (7 mg/kg) of the hallucinogen N,N-dimethyltryptamine (DMT) were administered intramuscularly to 11 21-28 yr old normal male experienced hallucinogen users. A gas chromatographic-mass spectrometric isotope dilution determination of DMT concentrations in whole blood and urine revealed that only a fraction of the injected dose was recovered, and the blood DMT concentrations had a very similar time course to the subjectively reported "high." (21 ref)—*Journal abstract.*

4724. Karler, Ralph; Cely, William & Turkianis, Stuart A. (U Utah, Coll of Medicine) **Anticonvulsant properties of  $\Delta^1$ -tetrahydrocannabinol and other cannabinoids.** *Life Sciences*, 1974(Sep), Vol 15(5), 931-947.—Anticonvulsant doses of  $\Delta^1$ -tetrahydrocannabinol ( $\Delta^1$ -THC) markedly lowered body temperature in male ICR mice at 22°C, but there was little such effect at 30°C. The drug abolished hind-limb extension in a maximal electroshock (MES) test, elevated both the MES (extensor) and 6-Hz electroshock thresholds, exerted no effect on the 60-Hz electroshock threshold, and enhanced minimal seizures caused by pentyleneetetrazol. All anticonvulsant properties studied, with the exception of the 60-Hz electroshock threshold, were unaffected by the hypothermia resulting at 22°C. Additional experiments with  $\Delta^1$ -THC indicated that chronic treatment resulted in the development of tolerance, as determined by the MES test with male Sprague-Dawley rats.  $\Delta^1$ -THC,  $\Delta^1$ -THC, cannabinol, and cannabidiol displayed anticonvulsant activity, as did the major, primary metabolite of  $\Delta^1$ -THC, 11-hydroxy- $\Delta^1$ -THC. The synthetic cannabinoids, dimethylheptylpyran and its isomers, were the most potent anticonvulsants in mice. Study of the activity of the cannabinoids demonstrates that these anticonvulsant properties are at least

partially separable among the various agents. (32 ref)—*Journal abstract.*

4725. Kaymakçalan, Şükrü. (Ankara U, Medical School, Turkey) **Tolerance to and dependence on cannabis.** *Bulletin on Narcotics*, 1973(Oct-Dec), Vol 25(4), 39-47.—Discusses physical dependence on cannabis and self-administration in monkeys. (24 ref)

4726. Keyes, Joseph B. (Louisiana State U) **Effect of ACTH on ECS-produced amnesia of a passive avoidance task.** *Physiological Psychology*, 1974(Sep), Vol 2(3-A), 307-309.—96 male albino rats given electroconvulsive shock (ECS) following a 1-trial passive avoidance step-down task showed amnesia for that task. Administering adrenocorticotrophic hormone 4 hrs after training produced recovery of the avoidance behavior. This suggests that reactivating the internal physiological state present during training is sufficient to retrieve memories that are inaccessible following ECS. (16 ref)—*Journal abstract.*

4727. Klein, Stephen B.; Barter, Marie J.; Murphy, Arthur L. & Richardson, John H. (Old Dominion U) **Aversion to low doses of mercuric chloride in rats.** *Physiological Psychology*, 1974(Sep), Vol 2(3-A), 397-400.—In contrast to the detrimental influence of low mercury doses observed in prior research, mercuric chloride had no significant effect on either emotional behavior in the open field or on aversive conditioning of 24 adult and 24 juvenile Sprague-Dawley rats in the 1-way shuttlebox. Results also show that mercuric chloride had no obvious physiological effect as indicated by the absence of significant differences between experimental Ss and the 24 controls. However, the data indicate that adult male and female Ss were capable of reducing their intake of a solution containing mercury. This aversion to low doses of mercury developed in the apparent absence of any gross physiological and behavioral impairment. Juvenile Ss were able to develop an aversion to sugar water containing mercury but exhibited a difficulty in maintaining their aversion.—*Journal abstract.*

4728. Klonoff, Harry. (U British Columbia, Vancouver, Canada) **Marijuana and driving in real-life situations.** *Science*, 1974(Oct), Vol 186(4161), 317-324.—Determined (a) the effects of low and high doses of marijuana (4.9 and 8.4 mg of  $\Delta^1$ -tetrahydrocannabinol) on driving performance in a restricted, traffic-free area (i.e., a driving course) and on the streets of a downtown area during peak hours of traffic flow, and (b) the effects of marijuana and driving on heart rate. Ss were 64 19-31 yr old volunteers with a mean of 6.92 yrs of driving experience. Results indicate that the smoking of marijuana does have a detrimental effect on driving skill and performance in a restricted driving area, and that this effect is even greater under normal driving conditions on city streets. Heart rates increased significantly during the drug (vs placebo) condition for all types of traffic patterns and events. The effects of marijuana appeared to be bidirectional—whether a significant decline occurred in driving ability was dependent both on S's capacity to compensate and on the dose. In some Ss whose driving performance improved, the explanation may be found in overcompensation and the sedative effect of the drug.—*L. Gorsev.*

4729. Koff, Wayne C. **Marijuana and sexual activity.** *Journal of Sex Research*, 1974(Aug), Vol 10(3), 194-204.

—Investigated the effects of marihuana on human sexual activity. Questionnaires were returned by 251 college students who smoke marihuana and a limited number of interviews were conducted. 57.8% of the females and 39.1% of the males stated that marihuana increased their sexual desire. 51.3% stated that sexual enjoyment increased following the use of marijuana. The most active dose was said to be 1-2 cigarettes containing 1% of tetrahydrocannabinol.—*E. B. Jaffa*.

4730. Kosman, Mary E. (American Medical Assn, Chicago, IL) **Pharmacokinetic drug interactions: Sedative, hypnotic, and antianxiety agents.** *JAMA: Journal of the American Medical Association*, 1974(Sep), Vol 229(11), 1485-1488.—Reviews evidence on the enhancement and inhibition of metabolism, drug distribution, and the clinical applications of sedative, hypnotic, and antianxiety drug interactions. Barbiturates have adverse effects on the course of coumarin therapy, manifested by increased or fluctuating anticoagulant requirements during combined therapy. In some patients, barbiturates may reduce the therapeutic response to corticosteroids, griseofulvin, and possibly to digitoxin, but they appear to have no effect on the response to methyl dopa. Plasma levels of tricyclic antidepressants and chlorpromazine may also be decreased by the barbiturates, but an effect on the clinical response has not been demonstrated. Chloral hydrate, chloral betaine, triclofos, glutethimide, ethchlorvynol, and possibly meprobamate may also alter responses to coumarin anticoagulants. Benzodiazepines appear to have no adverse interactions with coumarin anticoagulants or tricyclic antidepressants. (53 ref) —*Journal summary*.

4731. Ladisich, W. (Max-Planck-Inst für Psychiatrie, München, W Germany) **Effect of progesterone on regional 5-hydroxytryptamine metabolism in the rat brain.** *Neuropharmacology*, 1974(Sep), Vol 13(9), 877-883.—Investigated the influence of progesterone upon 5-hydroxytryptamine (5-HT) metabolism in the brains of ovariectomized Wistar rats in view of a possible connection with premenstrual tension and postpartum depression. A subcutaneous progesterone dose, resulting in a plasma level which was still in a physiological range, increased 5-HT turnover in septum, hypothalamus, and raphe. A higher unphysiological dose, besides producing a further increase of 5-HT turnover, also resulted in a decrease of 5-hydroxyindoleacetic acid levels which was most pronounced in the septum. Neither of the 2 doses showed a clearcut influence on 5-HT concentrations in any of the investigated brain areas.—*Journal abstract*.

4732. Lehrer, Paul M. & Taylor, H. Augustus. (Coll of Medicine & Dentistry of New Jersey—Rutgers Medical School, Piscataway) **Effects of alcohol on cardiac reactivity in alcoholics and nonalcoholics.** *Quarterly Journal of Studies on Alcohol*, 1974(Sep), Vol 35(3-A), 1044-1052.—After drinking an intoxicating amount of alcohol, the cardiac responses of 8 male alcoholics to loud tones and reaction-time trials were significantly different from those of nonalcoholics. Alcohol also affected the direction of the cardiac responses to the tones.

4733. Lowy, K.; Weiss, B. & Aboud, L. G. (U Rochester Medical Ctr) **Influence of an anticholinergic psychotomimetic agent on behaviour in cats controlled**

**by an auditory stimulus.** *Neuropharmacology*, 1974(Aug), Vol 13(8), 707-718.—Investigated the effects of N-methyl 4-piperidylcyclo butylphenyl glycolate (CBG), the quaternary derivative of CBG, and scopolamine on 7 cats trained to press a lever, the location of which corresponded to 1 of 2 sound sources. Ss were trained to lick a protruding sponge in dim light which then caused the main light to turn on and an auditory signal to be emitted from either side of a panel in the chamber. Any lever response terminated the trial. A food reward was given only if S pressed a lever on the same side as the sound signal. Doses of 10-20  $\mu$ /kg CBG reduced the number of responses and tended to lower the relative time spent in the light period. At lower doses CBG produced a marked increase in some Ss in total number of trials. Higher doses of scopolamine also reduced total trials, but less consistently. A number of Ss exhibited a lateral preference for either the right or left lever. CBG, but not scopolamine, markedly shifted this lateral tendency.—*Journal abstract*.

4734. Maickel, R. P. & Maloney, G. J. (Indiana U) **Taste phenomena influences on stimulation of deprivation-induced fluid consumption of rats.** *Neuropharmacology*, 1974(Aug), Vol 13(8), 763-767.—The dipsogenic actions of intraperitoneal barbital and chlordiazepoxide were selectively influenced by the taste of the consummatory fluid presented to deprived male Sprague-Dawley rats. The potency of barbital as a consummatory stimulant was reduced relative to distilled water or tartaric acid by the use of a pleasant tasting fluid, saccharin. The potency of chlordiazepoxide as a dipsogenic agent was reduced by the use of either tartaric acid or saccharin as a consummatory fluid as compared to water. Promazine depressed deprivation-induced fluid consumption with a similar potency regardless of the consummatory fluid used.—*Journal abstract*.

4735. Mendelson, Jack H.; Kuehnle, John; Ellingboe, James & Babor, Thomas F. **Plasma testosterone levels before, during and after chronic marihuana smoking.** *New England Journal of Medicine*, 1974(Nov), Vol 291(20), 1051-1055.—No statistically significant changes in plasma testosterone levels were observed in young adult males during and after a 21-day marihuana smoking period as compared with presmoking baseline levels. Data do not corroborate an association between chronic marihuana use and decreased plasma testosterone.

4736. Middaugh, Lawrence D.; Blackwell, L. Ann; Santos, Carroll A. & Zemp, John W. (Medical U South Carolina) **Effects of d-amphetamine sulfate given to pregnant mice on activity and on catecholamines in the brains of offspring.** *Developmental Psychobiology*, 1974(Sep), Vol 7(5), 429-438.—Offspring of C57BL/6J mice injected intraperitoneally with dextroamphetamine sulfate during the last third of pregnancy had slightly reduced body weight at birth, altered concentrations of catecholamines (CAs) in their brains during development, and increased activity after they had matured. Norepinephrine concentrations were depressed at birth, returned to control values by Day 3, and were elevated at Days 21 and 30. Dopamine values were elevated at Day 30. At Day 75, Ss prenatally exposed to the drug had CA concentrations similar to controls but had heightened

activity levels compared to controls tested in the open field. Results demonstrate that dextroamphetamine sulfate administered to mice during the last third of pregnancy produce transient alterations in CA concentrations and long-lasting changes in behavior. (27 ref)—*Journal abstract*.

4737. Milner, Joel S. (Western Carolina U) **Effects of d-amphetamine on acquisition of leverpress Sidman avoidance in rats.** *Physiological Psychology*, 1974(Sep), Vol 2(3-A), 392-396.—In 2 experiments with a total of 202 male and female Wistar rats, Ss, following intraperitoneal injections of dextroamphetamine, showed no drug-dose effects on response rates during the acquisition of a Sidman avoidance task. Dose-dependent differences in shock-avoidance rates were observed. Low test doses showed no effect on, moderate test doses facilitated, and high test doses inhibited shock-avoidance rates. Interresponse times (IRT) indicated that females, relative to males, emitted a greater number of well-timed responses and were facilitated by a relatively wider range of test doses. IRTs obtained during the acquisition study and motility data obtained from Exp II indicate that some mechanism other than increased motor activity, such as improved timing, was involved in amphetamine's facilitation of shock-avoidance rates. (24 ref)—*Journal abstract*.

4738. Mundo, Antonio S. et al. (Inst di Ricerche Farmacologiche "Mario Negri," Milano, Italy) **Relationships between tricyclic antidepressant concentrations, 1-H-noradrenaline uptake and chronotropic effect in isolated rat atria.** *European Journal of Pharmacology*, 1974(Oct), Vol 28(2), 368-375.—The main effect of imipramine, desipramine, amitriptyline, and chlorimipramine was a slowing of the spontaneous atrial rate which was more evident for the dimethyl than for the monomethyl compounds. All drugs potentiated 1-noradrenaline chronotropic response, but the potentiation was not always correlated with the inhibition of its uptake. Thus, inhibition of uptake is not a valid parameter for prediction of noradrenaline potentiation and vice versa. (19 ref)

4739. National Academy of Sciences, Committee on Problems of Drug Dependence. (Washington, DC) **Testing for dependence liability in animals and man (Revised 1972).** *Bulletin on Narcotics*, 1973(Apr-Jun), Vol 25(2), 25-39.—Describes procedures for submitting new compounds for evaluation in animals and man, and the details of evaluation.

4740. Panksepp, Jaak & Nance, Dwight M. (Bowling Green State U) **Effects of para-chlorophenylalanine on food intake in rats.** *Physiological Psychology*, 1974(Sep), Vol 2(3-A), 360-364.—Food intakes, water intakes, and body weights of a total of 42 Long-Evans and 18 Sprague-Dawley male rats in 3 experiments were monitored for up to 30 days during daily intragastric administration of 100 mg/kg p-chlorophenylalanine (PCPA). During treatment, food intake was reduced to 50-75% of control levels, water intake was decreased to about 28% of control levels, and body weights stabilized at about 80-90% of control levels. Body weight remained low as long as treatment continued, and Ss defended the low body weights against food deprivation and weight gain induced by insulin injections. It is unlikely that the

decrease in body weight during PCPA treatment was due to malaise, since anorexia could be prevented by depriving Ss of food during the 1st 2 days of drug treatment. (27 ref)—*Journal abstract*.

4741. Person, Robert J. & Gunn, C. G. (U Oklahoma, Health Sciences Ctr, Oklahoma City) **Effects of ethanol on recruiting, augmenting and reticular activation response thresholds.** *Quarterly Journal of Studies on Alcohol*, 1974(Sep), Vol 35(3-A), 987-1002.—Determined threshold levels of the thalamic recruiting and augmenting responses and reticular activating system responses in 20 paralyzed cats. Ethanol was infused intravenously in 12 cats to produce cumulative doses of 100, 200, 400, 800, and 1600 mg/kg of body weight. Compared with control levels, thresholds of the cortical desynchrony response to mesencephalic reticular formation stimulation decreased concomitant with an increase in threshold of the recruiting response after 100 mg/kg, but returned to control levels after 400 mg and, after the higher doses, increased in proportion to the blood ethanol concentration. Augmenting response thresholds increased after 100 mg and remained elevated at all higher doses. Cardiovascular pressor response thresholds remained constant after 100 mg, then increased after the higher doses in proportion to the blood alcohol concentration. Skin resistance thresholds were not significantly changed at any dose level. (27 ref)—*Journal abstract*.

4742. Pert, Agu & Avis, H. H. (Experimental Medicine Branch, Biomedical Lab, Edgewood Arsenal, MD) **Dissociation between scopolamine and mecamylamine during fear conditioning in rats.** *Physiological Psychology*, 1974(Jun), Vol 2(2), 111-116.—Tested whether or not state-dependent (dissociated) learning would occur differentially for scopolamine (muscarinic anticholinergic) and mecamylamine (nicotinic anticholinergic) in a conditioned suppression task. In Exp I, 84 food-deprived rats were trained to drink sweetened condensed milk in a test chamber for 8 days. On Day 9, all Ss received a single electric shock in the same chamber 20 min after injections of scopolamine, mecamylamine, or saline. 3 days later, subgroups were tested for conditioned suppression under the same drug condition, the other drug condition, or saline. Conditioned suppression was found in all groups except those trained under scopolamine or mecamylamine and tested under saline or the other drug condition. Exp II controlled for some of the variables which may have produced dissociation in Exp I. Findings are interpreted to imply the existence of 2 separate cholinergic (nicotinic and muscarinic) pathways which mediate fear conditioning. (23 ref)—*Journal abstract*.

4743. Regina, Edmund G.; Smith, Gene M.; Kelper, Charles G. & McKelvey, Robert K. (Massachusetts General Hosp, Boston) **Effects of caffeine on alertness in simulated automobile driving.** *Journal of Applied Psychology*, 1974(Aug), Vol 59(4), 483-489.—30 min after ingesting 200 mg of caffeine or a placebo, each of 24 21-26 yr old males drove an automobile simulator for 90 min. Immediately thereafter, the S ingested a supplemental dose of 200 mg of the medication taken initially and then drove for another 90 min. The simulator provided a comprehensive and coherent set of stimulus inputs which produced a degree of realism not usually found in

laboratory studies. Both the initial and the supplemental doses of caffeine significantly enhanced performance beyond that found with placebo, on each of 4 measures of alertness.—*Journal abstract.*

4744. Rigter, H.; Van Riezen, H. & de Wied, D. (Scientific Development Group, Oss, Netherlands) **The effects of ACTH- and Vasopressin-analogues on CO<sub>2</sub>-induced retrograde amnesia in rats.** *Physiology & Behavior*, 1974(Sep), Vol 13(3), 381-388.—In an experiment with 120 male Wistar-derived rats, amnesia for a 1-trial step-through passive avoidance response was induced by application of CO<sub>2</sub> until respiratory arrest occurred. An adrenocorticotrophic hormone (ACTH) analog, ACTH<sub>4-10</sub>, alleviated the amnesia when administered 1 hr prior to the retrieval test but not when given 1 hr prior to the acquisition trial. A behaviorally inert ACTH-analog, ACTH<sub>11-39</sub>, appeared to have no effect on the amnesia. A vasopressin-analog, desglycinamide lysine vasopressin, antagonized the amnesia when administered 1 hr prior to the acquisition trial or 1 hr prior to the test trial. The relevance of these data to present theories on amnesia is discussed. (26 ref)—*Journal abstract.*

4745. Rolls, E. T. et al. (U Oxford, England) **The relative attenuation of self-stimulation, eating and drinking produced by dopamine-receptor blockade.** *Psychopharmacologia*, 1974, Vol 38(3), 219-230.—Spiroperidol, which blocks dopamine (DA) receptors, attenuated self-stimulation of the nucleus accumbens, septal area, hippocampus, anterior hypothalamus, and ventral tegmental area of a total of 7 Sprague-Dawley and 24 Lister hooded male rats. The attenuation was not a simple motor impairment of the speed of barpressing in that the nucleus accumbens and septal self-stimulation rates were lower than those in treated Ss self-stimulating at other sites (Exp I). Feeding was partly attenuated and drinking was much less attenuated by the spiroperidol. Since the Ss barpressed for brain-stimulation reward, DA receptor blockade may attenuate complex motor responses most. Alternatively, the blockade could affect brain-stimulation reward more than the controls of eating, and these latter more than the controls of drinking (Exp II). In Exp III feeding and drinking were equally and severely attenuated when Ss had to barpress to obtain food or water. The attenuation was to a level similar to that found for self-stimulation. Results suggest that DA receptor blockade impairs eating, drinking, and self-stimulation by interfering with complex motor responses. (20 ref)—*Journal abstract.*

4746. Rosenberg, Kenneth M. & Sherman, Gordon F. (State U New York, Oswego) **Testosterone induced pup-killing behavior in the ovariectomized female rat.** *Physiology & Behavior*, 1974(Nov), Vol 13(5), 697-699.

4747. Ross, David H.; Medina, Miguel A. & Cardenas, H. Lee. (U Texas, Health Science Ctr, San Antonio) **Morphine and ethanol: Selective depletion of regional brain calcium.** *Science*, 1974(Oct), Vol 186(4158), 63-65.—Reports that administration of morphine or ethanol to Sprague-Dawley rats produced a decrease in regional brain calcium in vivo. Reserpine and the dopamine-acetaldehyde conjugate salsolinol also produced a depletion of regional brain calcium, but only the

salsolinol depletion was antagonized by naloxone. Evidence for 2 calcium-sensitive pools in the central nervous system was also reported. (18 ref)

4748. Salzman, Carl et al. (Massachusetts Mental Health Ctr, Psychopharmacology Research Lab, Boston) **Chlordiazepoxide-induced hostility in a small group setting.** *Archives of General Psychiatry*, 1974(Sep), Vol 31(3), 401-405.—Used a small group model to examine the effects of chlordiazepoxide hydrochloride on affective and behavioral hostility in a social interactive setting. 48 normal male volunteers in 3-person groups completed the Buss-Durkee Hostility Inventory individually and interacted with each other during a 10-min discussion period that was videotaped and scored for behavioral hostility. Results indicate that chlordiazepoxide was associated with an increase in individual affective but not behavioral hostility. However, when a frustration stimulus was presented to the group, interpersonal behavioral hostility was increased in those who received chlordiazepoxide as compared with those taking a placebo. Increases in hostility may be a regular rather than a paradoxical effect of chlordiazepoxide. However, overt hostility may only become apparent in settings of interpersonal frustration. (44 ref)—*Journal abstract.*

4749. Sampson, Larry D.; Francis, James & Schneiderman, Nell. (U Miami) **Selective autonomic blockades: Effects upon classical conditioning of heart rate and lever-lift suppression in rabbits.** *Journal of Comparative & Physiological Psychology*, 1974(Nov), Vol 87(5), 953-962.—Studied heart rate, blood pressure, and lever lifting during differential classical conditioning in 2 experiments with a total of 8 female Belgian hares. The unconditioned stimulus was electrical stimulation of the septal region or the hypothalamus through chronically implanted electrodes; the conditioned stimuli were 2 tones differing in frequency. Beta-adrenergic blockade by propranolol did not affect cardiovascular unconditioned responses (bradycardia and pressor UCRs), conditioned responses (bradycardia CRs), or lever-lift responses. Cholinergic blockade by atropine methylnitrate abolished heart-rate responses but not lever-lift responses. Findings suggest that heart-rate responses were mediated by increases in vagal tone. Alpha-adrenergic blockade by phentolamine abolished bradycardia and pressor UCRs, but not bradycardia CRs. It is also suggested that separate central mechanisms mediated bradycardia UCRs and CRs. Removal of the lever diminished without eliminating bradycardia CRs, indicating partial independence between lever-lift and cardiac CRs.—*Journal abstract.*

4750. Sanger, David J. & Steinberg, Hannah. (U Coll London, England) **Inhibition of scopolamine-induced stimulation of l-maze activity by  $\alpha$ -methyl-p-tyrosine and by lithium.** *European Journal of Pharmacology*, 1974(Oct), Vol 28(2), 344-349.—In 2 experiments a single intraperitoneal dose of scopolamine (1 mg/kg) markedly increased the spontaneous activity of 40 female Lister hooded rats when tested in a Y-shaped runway as compared with 40 saline controls. When Ss were retested in the maze 24 hrs later, this time without any drugs having been administered, those which had previously been tested under the influence of the drug were again more active than the controls. Pretreatment before the

1st trial with either  $\alpha$ -methyl-p-tyrosine or lithium chloride blocked the immediate stimulant action of scopolamine though it did not significantly modify the after-effect. (29 ref)—*Journal abstract*.

4751. Schneider, Allen M.; Weinberg, Joel & Weissberg, Robert. (Swarthmore Coll) **Effects of ACTH on conditioned suppression: A time and strength of conditioning analysis.** *Physiology & Behavior*, 1974(Nov), Vol 13(5), 633-636.—Measured the effects of subcutaneous adrenocorticotrophic hormone (ACTH) injections on acquisition and retention of a conditioned-suppression response as a function of the time of training and the duration of the conditioned stimulus. Training of the Ss (174 experimental and 48 control male Sprague-Dawley rats) consisted of a single trial in which either a 10- or 60-sec tone was followed by footshock. Retention increased following a shift in time of training from AM to PM and in tone duration from 60 to 10 sec. ACTH as corticotrophin gel was injected before training, before testing, or before both training and testing. The facilitory effects of the injections were selective. Retention was improved given that the injections were made before training, as opposed to before testing, and that training was conducted in the AM. In the 60-sec tone condition, the facilitory effects of the injections before training were canceled if the Ss were also injected before testing.—*Journal abstract*.

4752. Schnell, R. C. (Purdue U, School of Pharmacy & Pharmacal Sciences) **Enhancement of the chlorpromazine-induced suppression of the conditioned avoidance response by carbonic anhydrase inhibition.** *Neuropharmacology*, 1974(Sep), Vol 13(9), 847-850.—Suppression of a conditioned avoidance response in male Holtzman rats by 2 mg/kg chlorpromazine hydrochloride (CPZ) given intraperitoneally was enhanced (230%) after treatment with 50 mg/kg acetazolamide. This enhanced pharmacological response in the acetazolamide-treated Ss was accompanied by increased brain levels of  $^3\text{H}$  after administration of CPZ. In parallel experiments, an analog of CPZ, CL-13,850, which possesses no carbonic anhydrase inhibitory activity, had no influence on the pharmacological effect or the brain levels of  $^3\text{H}$  after administration of CPZ. Data suggest the enhanced pharmacological response following acetazolamide treatment is the result of increased brain levels of CPZ brought about by carbonic anhydrase inhibition. (16 ref)—*Journal abstract*.

4753. Schwartz, John L.; Kramer, Milton & Roth, Thomas. (U Cincinnati, Coll of Medicine) **Triazolam: A new benzodiazepine hypnotic and its effect on mood.** *Current Therapeutic Research*, 1974(Sep), Vol 16(9), 964-970.—Administered triazolam to 12 normal male paid volunteers in clinical doses of .25, .50, and 1.00 mg. Triazolam had no significant effect on Ss' mood or normal mood rhythms. There were no pre- or postsleep effects on mood, and no systematic differences in mood were noted at the various dose levels. More research investigating the effect on mood of the commonly used hypnotics during both acute and chronic usage is clearly warranted.—*Journal abstract*.

4754. Shillito, M. Larry; King, L. Ellis & Cameron, Colin. (Eastman Kodak Co, Rochester, NY) **Effects of alcohol on choice reaction time.** *Quarterly Journal of*

*Studies on Alcohol*, 1974(Sep), Vol 35(3-A), 1023-1034.—Studied the effects of alcohol on choice reaction time, information transmission and task performance in 5 23-28 yr old men who completed a keypressing task after they drank 0, .26, .52, and .78 ml of alcohol/kg of body weight. Mean peak blood alcohol concentrations after the 3 doses were .001, .037 and .055%. None of the doses of alcohol had a significant effect on choice reaction time, information transmission, or number of errors. The lowest rate of error was achieved after the .26 ml/kg dose, suggesting a facilitative effect. Accuracy appeared to be more sensitive than speed to the effects of alcohol. It is concluded that complex motor skills are more likely to be affected by low doses of alcohol than cognitive functions. (35 ref)—*Journal abstract*.

4755. Simpson, Lance L. (Columbia U, Coll of Physicians & Surgeons) **A study of the interaction between amphetamine and food deprivation.** *Psychopharmacologia*, 1974, Vol 38(4), 279-286.—Studied the effect of dextroamphetamine on spontaneous motor behavior in 31 male Wistar satiated and food-deprived rats. Amphetamine (1 mg/kg) evoked a large increase in motor activity in satiated Ss and an even larger increase in deprived Ss. The magnitude of motor stimulation by amphetamine in deprived Ss was roughly proportional to the duration of deprivation. Food deprivation by itself did not increase motor activity. Neither sympathectomy nor adrenalectomy modified the response to amphetamine or to amphetamine plus deprivation. Data suggest that food deprivation potentiates the action of amphetamine by a central rather than a peripheral mechanism.—*Journal abstract*.

4756. Soubrie, P. et al. **Preselection of animals in studies of anti-anxiety drugs.** *Neuropharmacology*, 1974(Aug), Vol 13(8), 719-728.—Experiments with male Wistar rats in the open field led to Ss' classification into 2 emotionality groups. Results show that (a) the distribution of the number of Ss in each group was stable and reproducible over a 3-mo period; (b) Ss of the emotional group were more susceptible to gastric lesions produced by immobilization; (c) Ss which were more susceptible to lesions showed more behavior deterioration upon repeated trials in a heated floor maze; and (d) the favorable action of benzodiazepines—reduction in the number of Ss developing lesions and reduction of the behavioral deterioration in the heated floor maze—was group dependent. Dextroamphetamine imipramine, and chlorpromazine acted independently of emotionality. A relationship between emotionality and differential susceptibility to drugs is discussed. The preselection of animals in studies of antianxiety drugs is considered as a possible way to more precise results and as a possible approach to a better understanding of the mechanism of action of anxiolytics. (37 ref)—*Journal abstract*.

4757. Spohn, Herbert E.; Lacoursiere, Roy B. & Williams, Roger O. (Menninger Foundation, Topeka, KS) **The effect of chlorpromazine on visual information processing in normal subjects.** *Journal of Nervous & Mental Disease*, 1974(Sep), Vol 159(3), 198-204.—Tested the hypothesis that chlorpromazine (CPZ) has the effect in visual information processing of protecting the short-term memory (STM) visual trace by serving to filter or habituate stimuli following an initial stimulus. 40 normal

undergraduates served as Ss. The method involved the tachistoscopic presentation of paired, successive  $3 \times 2$  consonant arrays, separated by a 200-msec interval, with instructions to report either the 1st or the 2nd array, in a double-blind repeated measurement design in which Ss served as their own placebo controls and a single dose of 50 mg of CPZ was administered. Results do not support the hypothesis but suggest that when ipsimodal, isomorphic distraction follows an initial relevant stimulus, CPZ reduces the STM span and delays the processing (coding) of visual information.—*Journal abstract.*

4758. Stephens, Joseph H.; Shaffer, John W. & Brown, Clinton C. (Johns Hopkins U, Medical School) **A controlled comparison of the effects of diphenylhydantoin and placebo on mood and psychomotor functioning in normal volunteers.** *Journal of Clinical Pharmacology*, 1974(Oct), Vol 14(10), 543-551.—Studied the effects of diphenylhydantoin (DPH) on motor functioning and mood in 107 21-32 yr old normal volunteers. Evaluation measures included the Lorr Outpatient Mood Scale, Outpatient Symptom Check List, Wessman-Adler Personal Feeling Scales, steadiness, apparent eye level, puzzle box, and time estimation tasks, and the Modified Stroop Color-Word Test. Each S was randomly assigned to one of 2 experimental conditions for 2 wks: 100 mg DPH 3 times daily or 5 mg DPH 3 times daily. Significant differences were found on 10 of the 29 mood measuring variables and on 1 of the 9 variables measuring psychomotor coordination and intellectual functioning. (23 ref)—*P. Federman.*

4759. Stricker, Edward M. & Macarthur, John P. (U Pittsburgh, Psychobiology Program) **Physiological bases for different effects of extravascular colloid treatments on water and NaCl solution drinking by rats.** *Physiology & Behavior*, 1974(Sep), Vol 13(3), 389-394.—Notes that extravascular injections of colloidal solutions gradually promote the sequestration of isosmotic protein-free plasma fluid which has been extruded from local capillaries. This procedure avoids many of the drawbacks of hemorrhage and seems ideal for studying appetitive behaviors elicited by hypovolemia. In the present 2 experiments with a total of 99 male Sprague-Dawley rats, Ss given 30% polyethylene glycol (PG) solution subcutaneously increased their intake of water and, after a delay of 6-8 hrs, also began to drink concentrated NaCl solution. Ss given the same colloidal solution intraperitoneally showed thirst but did not develop a sodium appetite. These behaviors can be related to the induced plasma volume deficits, which persist only so long as the colloid remains where it is injected. Thus, progressive decreases in plasma volume occur for 12-18 hrs after subcutaneous injections, and PG does not appear in plasma during this time. In contrast, PG can be found in plasma within 6-12 hrs after intraperitoneal injection, which rapidly vitiates the effects of this treatment and thereby removes the hypovolemic stimulus for NaCl intake. (26 ref)—*Journal abstract.*

4760. Stripling, Jeffrey S. & Alpern, Herbert P. (U Colorado, Inst for Behavioral Genetics) **Nicotine and caffeine: Disruption of the long-term store of memory and proactive facilitation of learning in mice.** *Psychopharmacologia*, 1974, Vol 38(3), 187-200.—Conducted 3

experiments in which a wide range of intraperitoneal dosages of nicotine and caffeine were administered to a total of 301 male F<sub>1</sub> mice (C57BL/6J  $\times$  DBA/2J). Ss were given 2 trials in an appetitive maze 24 hrs apart. 24 hrs after the 2nd trial each S was given the 1st of 5 daily injections of one of the dosages being tested. Beginning 48 hrs after the last injection, Ss received 1 trial/day until a learning criterion was reached. Both nicotine and caffeine produced a dose-dependent disruption of performance in the trials following the injection series. In contrast, nicotine produced facilitation of performance in Ss given a series of injections in the absence of previous training, and caffeine produced a strong trend in this direction. It is concluded that these drugs produced disruption of the long-term store of memory for the initial training and proactive facilitation of maze learning. The existence of separate and opposing effects of these drugs on different aspects of learning and memory is discussed. (57 ref)—*Journal abstract.*

4761. Székely, J. I.; Borsy, J. & Ildikó, Király. (Research Inst for Pharmaceutical Chemistry, Budapest, Hungary) **Potentiation of tetrabenazine-induced behavioural depression by imipramine on a discrete-trial avoidance escape schedule.** *Psychopharmacologia*, 1974, Vol 38(4), 339-343.—Studied the tetrabenazine-imipramine interaction on a discrete-trial avoidance escape schedule in 24 male hooded Long-Evans rats. In a large dose, imipramine (30 mg/kg intraperitoneal injections) failed to antagonize the 10 mg/kg (subcutaneous) tetrabenazine-induced behavioral depression. 3-6 mg/kg imipramine in combination with .5 mg/kg tetrabenazine induced a significant depression, while the same drugs alone (in similar dose) had no significant effect on responding. The depressant action of 1 mg/kg tetrabenazine was potentiated by imipramine pretreatment.—*Journal abstract.*

4762. Tong, J. E.; Knott, V. J.; McGraw, D. J. & Leigh, Gillian. **Alcohol, visual discrimination and heart rate: Effects of dose, activation and tobacco.** *Quarterly Journal of Studies on Alcohol*, 1974(Sep), Vol 35(3-A), 1003-1022.—Measured visual discrimination (2-flash threshold) and heart rate in 21-35 yr old male social drinkers after they had consumed various amounts of 35% alcohol and in combinations of low (relaxed) and high (exercising) arousal conditions. In 10 low-arousal Ss, mean blood alcohol concentrations (BACs) between .05 and .08% were associated with a decrease in tiny eye movements and an increase in facial movements during visual discrimination trials. Data also show that sensory sensitivity correlated positively with low doses of alcohol in low-arousal Ss and negatively in high-arousal Ss, but high doses lowered sensitivity regardless of arousal condition. Data from 8 nonsmokers and 8 smokers (age range 19-26) obtained before and after 2 cigarettes show that heart rate significantly increased after both doses of alcohol and after smoking. In 6 smokers, flash threshold scores were higher (less efficient discrimination) after alcohol when they did not smoke; after smoking and a low dose of alcohol, scores were significantly lower. It is concluded that visual discrimination is enhanced at BACs below .02%; after smoking, however, this improvement is significant only at higher BACs. (92 ref)—*Journal abstract.*

4763. Ungerer, Arielle; Ropartz, Philippe & Karli, Pierre. (U Louis Pasteur, Lab de Psychophysiology, Strasbourg, France) [Modifications of bioelectrical activity of the hippocampus of mice induced by acetoxycycloheximide.] (Fren) *Physiology & Behavior*, 1974(Nov), Vol 13(5), 653-660.—Chronically implanted 12 male Swiss mice with electrodes in dorsal hippocampus and in mesencephalon. Effects of acetoxycycloheximide (AXM) on spontaneous bioelectrical activity of the hippocampus and on hippocampal response to mesencephalic stimulation were analyzed. Subcutaneous AXM injection provoked a decrease in frequency and amplitude of the spontaneous hippocampal activity and a marked decrease in the theta activity in the 6-10 cyc/sec band. AXM induced no change in the mesencephalic stimulation threshold shown to induce hippocampal theta rhythm. However, decrease in frequency and amplitude of the theta rhythm induced by mesencephalic stimulation was recorded. These alterations, which appeared during the 1st hour following AXM injection, were especially obvious from 3-6 hrs after treatment. From 7-24 hrs after injection, the hippocampal bioelectrical activity, either spontaneous or induced, recovered gradually its initial characteristics. (French summary) (26 ref)—*English summary*.

4764. Vale, Jack R.; Ray, Donald & Vale, Carol A. (U California, Berkeley) Neonatal androgen treatment and sexual behavior in males of three inbred strains of mice. *Developmental Psychobiology*, 1974(Sep), Vol 7(5), 483-488.—Male neonates of the A, BALB/c, and C57BL/6 mouse strains were injected subcutaneously with androgen and the effects upon their sex behavior studied. Genotype and treatment combined interactively on a number of variables, particularly in the proportions of Ss responding, indicating that the effects of perinatally administered androgen and genotype cannot be considered separately. (20 ref)—*Journal abstract*.

4765. Valli, P.; Taglietti, V. & Rossi, M. L. (U Pavia, Inst of General Physiology, Italy) Effects of D-tubocurarine on the ampullar receptors of the frog. *Acta Otolaryngologica*, 1974(Jul-Aug), Vol 78(1-2), 51-58.—Curare depressed or abolished both the resting discharge of the ampullar receptors and their responses to mechanical or electrical stimulations administered to the isolated open semicircular canals. This blockade of the mechanical responsiveness in ampullar receptors was fully reversible 15 min after withdrawal of the drug, while resting discharge and electrical responsiveness were much more rapidly restored and even enhanced in excess of normal values after washing. (German summary)

4766. Vasquez, Beatriz J.; Overstreet, David H. & Russell, Roger W. (U California, Irvine) Psychopharmacological evidence for increase in receptor sensitivity following chronic morphine treatment. *Psychopharmacologia*, 1974, Vol 38(4), 287-302.—Conducted 2 experiments to study the behavioral effects of cholinergic and adrenergic agents on fixed ratio responding in 32 male Sprague-Dawley control rats and in rats chronically treated with morphine (5 mg/kg day). Tolerance to morphine on total responses was observed, but not on rate of responding. Following tolerance development, pilocarpine depressed the behavior of the morphine-treated Ss to a significantly greater degree than that of

the controls. Similarly, drugs which directly or indirectly stimulate alpha adrenergic and central dopaminergic receptors (e.g., atropine and nicotine) also affected the behavior of the morphine-treated Ss to a significantly greater degree. Muscarinic cholinergic, alpha adrenergic, and central dopaminergic receptors may become supersensitive to their respective neurotransmitters during chronic treatment with morphine. Such a change in receptor sensitivity could constitute a mechanism underlying the development of tolerance to morphine. (4 p ref)—*Journal abstract*.

4767. Wauquier, A. & Niemegeers, C. J. (Janssen Pharmaceutica, Research Lab, Beerse, Belgium) Intracranial self-stimulation in rats as a function of various stimulus parameters: V. Influence of cocaine on medial forebrain bundle stimulation with monopolar electrodes. *Psychopharmacologia*, 1974, Vol 38(3), 201-210.—Studied the effects of different subcutaneous doses of cocaine (.63, 1.25, 2.50, 5.00 and 10.00 mg/kg) on self-stimulation in 6 male Wistar rats. Monopolar nichrome electrodes were implanted in the medial forebrain bundle at the level of the lateral hypothalamus. 6 different stimulus parameter combinations (SPCs) inducing different predictable response rates were used. Cocaine showed a dose-related response stimulation, the highest at 10 mg/kg; the response depression was very low at all doses. Apomorphine, amphetamines, and cocaine had some properties in common, but there were also important differences. With the 3 compounds response stimulation was related to the total control response rates at the different SPCs and was the highest at the 2 SPCs inducing the lowest control response rate. The differences in response stimulation associated with low intensity and low frequency SPCs could be related to a different mechanism of action. The response depression, the highest with apomorphine and the lowest with cocaine, seems to be related to the stereotype-inducing property of the compounds. (18 ref)—*Journal abstract*.

4768. Weltz, Mary K. (U Hawaii) Effects of ethanol on shock-elicited fighting behavior in rats. *Quarterly Journal of Studies on Alcohol*, 1974(Sep), Vol 35(3-A), 953-958.—Studied shock-elicited fighting in 16 male hooded rats after they received intraperitoneal injections of saline or .25, .50, or .75 cc of a 30% ethanol solution per 100 g of body weight. Ss received all treatments and were tested in pairs. The base rate of fighting behavior was established for each pair between sessions. Compared with saline, the lowest dose of ethanol increased the frequency of fighting ( $p < .008$ ), the medium dose tended to increase it, while the high dose decreased it.—*Journal abstract*.

4769. Yanagita, T. (Central Inst for Experimental Animals, Kawasaki, Japan) An experimental framework for evaluation of dependence liability of various types of drugs in monkeys. *Bulletin on Narcotics*, 1973(Oct-Dec), Vol 25(4), 57-64.—Presents profiles of several drugs of abuse in terms of their ability to produce physical dependence, self-administration, and behavioral toxicity. Procedures are described for testing drugs in monkeys for (a) acute central nervous system effect, (b) substitution in morphine- or barbiturate-dependent animals, (c) ability to produce tolerance and physical dependence, (d) self-administration with experimental compound

after establishing self-administration for a standard reference drug, (e) intravenous or intragastric continuous self-administration, and (f) increasing ratio to obtain the reinforcement of the experimental drug.—A. S. Kulkarni.

4770. Ziskind, David; Amit, Zalman & Baum, Morrie. (Sir George Williams U, Ctr for Research on Drug Dependence, Montreal, Quebec, Canada) **Resistance to extinction of an avoidance response in rats following the administration of chlordiazepoxide (Librium) or diazepam (Valium).** *Psychopharmacologia*, 1974, Vol 38(3), 231-238.—In a 1-way avoidance task with a total of 140 male Wistar rats, intraperitoneal injections of Librium following avoidance acquisition resulted in prolonged resistance to extinction of the avoidance response. This effect occurred regardless of whether the Ss had had prior experience with Librium or whether they were naive with respect to the drug. The same results were found with the same task when low doses of Valium were used. However, at a higher dosage an "extreme reaction" of either no responding or a high number of responses to extinction occurred in the naive Ss. 16 saline controls served in both Exps I and II. The Librium and Valium effects were compared to similar effects obtained using ethanol and hashish resin. Results indicate that the novelty hypothesis cannot be supported, because experience with the drugs prior to avoidance training did not attenuate the drug effect on avoidance. ## ANIMAL PSYCHOLOGY

4771. Agranoff, B. W. & Davis, R. E. (U Michigan, Mental Health Research Inst, Neuroscience Lab) **More on seasonal variations in goldfish learning.** *Science*, 1974(Oct), Vol 186(4158), 65.—Refutes E. J. Fjerdingstad's 1973 suggestion that the authors' previous findings of seasonal variations in goldfish learning were due only to stress of shipping and starvation in the laboratory. Further evidence for seasonal variations is presented in terms of age, time of breeding, methods of handling, and physiological status of the goldfish.

4772. Baiz, Yasmira & Galvis, Carlos M. (U Javeriana, Bogotá, Colombia) **[A new type of maze.]** (Span) *Revista Latinoamericana de Psicología*, 1974, Vol 6(2), 235-238.—Describes the Galvis-Baiz Multiple Maze, a simple and flexible instrument for the study of psychological processes in small animals. It consists of a large box with 40 wooden cubes. The alleys of the maze are formed with the cubes without any additional tools.

4773. Davis, David E. (Ed.). (North Carolina State U, Raleigh) **Behavior as an ecological factor.** Stroudsburg, PA: Dowden, Hutchinson & Ross, 1974. xv, 390 p. \$24.—Presents a collection of 27 papers which trace the development of the study of animal behavior as it relates to the environment. Topics include behavioral adjustments to habitat, reproductive behavior, social behavior, behavior of populations, and applied behavior.

4774. Ehrlich, Annette. (California State U, Los Angeles) **Infant development in two prosimian species: Greater galago and slow loris.** *Developmental Psychobiology*, 1974(Sep), Vol 7(5), 439-454.—Recorded the initial appearance and/or the eventual disappearance of vari-

ous simple motor behaviors in 9 greater galago and 5 slow loris infants. The time spent by 4 mother-infant pairs in contact, near, and away from each other was measured during the first 10 wks of life. Results show that (a) contrary to the views advanced by some authors, the speed with which simple motor behaviors attained the adult form was not related in any consistent way to phyletic status, age at which sexual maturity was reached, or the mother's ability to provide manual support for her infant; (b) the pattern of mother-infant interaction was more variable in prosimian than in anthropoid primates; and (c) the disappearance of involuntary foot-grasping coincided with the initiation of infant independence from the mother. (17 ref)—*Journal abstract*.

4775. Gallup, Gordon G. (Tulane U) **Animal hypnosis: Factual status of a fictional concept.** *Psychological Bulletin*, 1974(Nov), Vol 81(11), 836-853.—Notes that animal hypnosis, or tonic immobility, is an easily induced and readily quantifiable phenomenon found in many different species. Recent findings on the behavioral, ecological, chemical, neurological, genetic, and ontogenetic aspects of animal hypnosis are reviewed in light of current and historical interpretations. The response seems to be quite sensitive to manipulations designed to affect fear. In terms of adaptive significance, the reaction can be modified through selective breeding, and both naturalistic as well as laboratory investigations bolster the thesis that tonic immobility may participate in the ecology of predator-prey relationships. (93 ref)—*Journal abstract*.

4776. Kozlovskaya, I. B. et al. (Inst of Problems of Information Transmission, Moscow, USSR) **Preprogrammed and feedback-guided movements of monkeys.** *Behavioral Biology*, 1974(Oct), Vol 12(2), 243-248.—Presents evidence for preprogramming of a certain type of arm movement made by 4 chronic Cebus monkeys in execution of a self-paced step-tracking task. Accuracy of guiding a handle into mechanically undetectable target areas depended on adequate auditory or visual target cues or on consistent practice without cues. "Continuous" movements made in one step retained their original learning amplitudes, revealing their preprogrammed mode of execution. In contrast, "discontinuous" movements, made in successive small steps, over- or undershot for many trials, until residual cues were used by the Ss. The 2 Ss that were well trained to the use of continuous movements retained their use during cue deprivation, while the others substituted discontinuous movements.—*Journal abstract*.

4777. Leibrecht, Bruce C. (US Army Medical Research Lab, Experimental Psychology Div, Ft Knox, KY) **Small animal restraint and movement detection apparatus.** *Physiology & Behavior*, 1974(Sep), Vol 13(3), 455-459.—Describes a restraint and movement detection device for use in behavioral studies with small animals. The apparatus consists essentially of a hinged 2-piece circular neck collar attached to a platform stabilimeter. The device is simple, inexpensive, and easy to use. (31 ref)

4778. Parker, Christopher E. (San Diego State U) **Behavioral diversity in ten species of nonhuman primates.** *Journal of Comparative & Physiological Psy-*

chology, 1974(Nov), Vol 87(5), 930-937.—The manipulative propensity and diversity of 4 members each of 10 species of primates, from lemurs to great apes to a simple inanimate object was recorded by means of a multidimensional behavioral taxonomy. The great apes as a group demonstrated a higher degree of behavioral diversity as indexed by (a) the number of combinations of body part and action used, (b) an index of diversity based on the communications technology concept of uncertainty, and (c) the proportion of the total behavior accounted for by the 30 most frequent response categories. (20 ref)—*Journal abstract*.

4779. Sachs, Benjamin D. & Rosenblatt, Jay S. (U Connecticut) **Prepartum suckling reduces survival of newborn in the rat.** *Developmental Psychobiology*, 1974(Sep), Vol 7(5), 399-406.—Induced 46 pregnant female Sprague-Dawley albino rats to show maternal behavior by continuous exposure to 5-10 day old pups. Prepartum suckling continuing into the immediate postpartum period (when the new litter was present) resulted in a high rate of mortality among the newborn. Preventing suckling by the older pups by sealing their mouths with collodion or removing them within 17 hrs before parturition restored the normal low rate of pup mortality. Examination showed that pre- and early postpartum suckling by the older pups had damaged the mother's nipples preventing the delivery of milk to the newborn. Presumably, the mother's nipples are hormonally conditioned to respond to the sucking of newborn at parturition and become gradually adapted to the increased suckling strength of older pups as nursing proceeds.—*Journal abstract*.

4780. Welker, Christian. (Justus-Liebig-U, Fachbereichs Biologie und Zentrum für Neurologie, Giessen, W Germany) [Ethological importance of urine-washing of *Galago crassicaudatus*.] (Germ) *Folia Primatologica*, 1973, Vol 20(5-6), 429-452.—Studied behavioral sequences in which 2 male thick-tailed galagos urinated on hands or feet. Frequency depended on temperature, humidity, and substrate conditions. Urination provided additional moisture to the palmar or solar surfaces, but no support was found for the hypothesis that the behavior functions as an olfactory marker. Activity profiles are also reported. (32 ref)—*English abstract*.

4781. White, Fred N. & Kinney, James L. (U California, Los Angeles) **Avian incubation.** *Science*, 1974(Oct), Vol 186(4159), 107-115.—Discusses evidence of the relationship between attentiveness and environmental temperature in a single-sex intermittent incubator, the village weaverbird (*Ploceus cucullatus*). The relationship between nest insulation and attentiveness, mean egg temperature and embryonic heat production, and adjustments in attentiveness and environmental temperature are also examined. It is concluded that interactions among behavior, environment, nest, and eggs result in regulation of egg temperature. (30 ref)

### Learning & Motivation

4782. Billbrey, John & Winokur, Stephen. (Texas Christian U) **Behavioral contrast in a second-order multiple schedule of reinforcement.** *Bulletin of the Psychonomic Society*, 1974(Sep), Vol 4(3), 206-208.—3 auto-sexing King pigeons were maintained on a 2-

component multiple schedule of reinforcement, each component of which was a 2-component multiple schedule. Behavioral contrast was produced when (a) 1 of 2 variable interval (VI) 5-min components, (b) 1 of 2 VI 1-min components, or (c) 1 VI 5-min and 1 VI 1-min component were changed to extinction. The magnitude of the behavioral contrast was the same in all 3 cases. Some generalization of extinction and contrast was observed. Data are interpreted as favoring an account of behavioral contrast which is based on emotional processes.—*Journal abstract*.

4783. Bulut, Fatma G. & Altman, Joseph. (Purdue U, Lab of Developmental Neurobiology) **Spatial and tactile discrimination learning in infant rats motivated by homing.** *Developmental Psychobiology*, 1974(Sep), Vol 7(5), 465-473.—Tested 96 6-, 10-, and 15-day-old Purdue-Wistar rats in each of 2 experiments on acquisition and reversal of position and tactile discrimination tasks in a 2-choice situation using access to the home cage as reinforcement. In the early trials the 6-day group often failed to respond due to locomotor immaturity. Despite the missed opportunities, they mastered the position habit in about the same number of choice trials as the 10-day group. However, the 15-day group was superior to the 2 younger groups. In tactile discrimination these subgroups differed significantly in learning to select the rough or smooth surfaces both in acquisition and reversal. On both the spatial and the tactile discrimination tasks the Ss older than 2 wks showed improvement in learning ability. (30 ref)—*Journal abstract*.

4784. Carlson, John G. (U Hawaii) **Preconditioning the effects of shock-correlated reinforcement.** *Journal of Experimental Psychology*, 1974(Sep), Vol 103(3), 409-413.—Taught 24 albino rats a discrimination problem with respect to 2 auditory stimuli (S<sub>1</sub> and S<sub>2</sub>). Pressing 1 lever in the presence of S<sub>1</sub> was followed by food and a mild electric shock, and pressing a 2nd lever in the presence of S<sub>2</sub> was reinforced with food alone. A group for which the stimuli had been paired with the reinforcers in an earlier phase in the same relationship (i.e., S<sub>1</sub> = food plus shock, S<sub>2</sub> = food alone) acquired the discrimination most rapidly. A group for which the stimuli and reinforcers had been prepared in the opposite of this order (i.e., S<sub>1</sub> = food plus shock, S<sub>2</sub> = food alone) learned least rapidly. Results are interpreted in light of an associative mediational theory and a current "distinctive cue" hypothesis of shock-correlated reinforcement effects.—*Journal abstract*.

4785. Dua, J. K. & Dobson, M. J. (U New England, Armidale, NSW, Australia) **Role of olfactory cues in acquisition and extinction of avoidance.** *Journal of Experimental Psychology*, 1974(Sep), Vol 103(3), 461-465.—Used 124 male albino rats as Ss in 2 experiments. In a hurdle-jumping situation a model animal was shocked behind either an opaque door or a transparent door in the safe box, thus providing olfactory or olfactory-visual cues, respectively. One control group used a nonshocked model animal (olfactory control) in the safe box, and another control group had no animal in the safe box. The study of avoidance in test Ss showed that olfactory and olfactory-visual groups made fewer avoidance responses than the control groups. In Exp II, olfactory, olfactory

control, and no-animal control Ss were given extinction after acquisition to a criterion. The avoidance in the olfactory group was less resistant to extinction than that in the control groups. Results are discussed in terms of N. E. Miller's 1951 fear reduction theory. (20 ref)  
—*Journal abstract.*

4786. Goldstein, Melvin L. (Indiana U, Kokomo) **The persistence of UCS intensity effects in acquired drive conditioning.** *Bulletin of the Psychonomic Society*, 1974(Sep), Vol 4(3), 166-168.—Measured the persistence of conditioned fear for varying intervals of time after conditioning 16 male Holtzman albino rats in an acquired drive experiment. Unconditioned stimulus (UCS) intensity and number of conditioned-stimulus-UCS pairings were varied at 2 levels during conditioning, and the effects on a hurdle-jump test response were measured. It was found that the effects of a high UCS intensity persisted for 7 days after conditioning, but that the effects of a medium UCS intensity dissipated 48 hrs after conditioning. Results are interpreted in terms of the relative contribution of UCS intensity to learning and to drive in the Spence-Hull system.—*Journal abstract.*

4787. Gustavson, Carl R. & Garcia, John. (Eastern Washington State Coll) **Aversive conditioning: Pulling a gag on the wily coyote.** *Psychology Today*, 1974(Aug), Vol 8(3), 68-72.—Shooting coyotes and other species who eat sheep is in the long run counterproductive because natural predators keep down the populations of species (e.g., rabbits) who compete with the sheep for grass. Conditioning coyotes to avoid sheep may be possible using lamb meat tainted with lithium chloride. Such meals make coyotes sick and seem to cause them to avoid sheep but do not affect their ability to feed on other species.—*E. J. Posavac.*

4788. Hall, Geoffrey & Honig, W. K. (U Sussex, Lab of Experimental Psychology, Brighton, England) **Stimulus control after extradimensional training in pigeons: A comparison of response contingent and noncontingent training procedures.** *Journal of Comparative & Physiological Psychology*, 1974(Nov), Vol 87(5), 945-952.—In an experiment with a total of 32 White Carneaux pigeons, 2 groups of Ss for which reinforcement was procured by keypecking were given true discrimination (TD) or pseudodiscrimination (PD) training with different colors of the house light before they were taught to peck at a display of 3 vertical lines and tested on the line orientation continuum. 2 other groups were trained in the same way except that no response was required during discrimination training. Of the latter groups, the TD-trained Ss acquired the keypecking response (with autoshaping) more quickly than the PD-trained Ss. Their generalization gradients did not differ. Of the former groups, the TD-trained Ss produced a steeper generalization gradient than the PD-trained Ss. These results suggest that (a) general transfer effects are produced by TD and PD training and (b) differential stimulus control resulting from these procedures is mediated by the operation of response-produced cues.—*Journal abstract.*

4789. Hatton, Glenn I. & Veith, Allen. (Michigan State U) **Stress-related and diurnal alcohol drinking in rats.** *Bulletin of the Psychonomic Society*, 1974(Sep), Vol 4(3), 195-196.—Recorded ethanol intakes 24 hrs/day for 3 adult male Holtzman albino rats which experienced

shock avoidance sessions during the light portion of a 14-hrs-light to 10-hrs-darkness cycle. Results show that (a) Ss drank immediately after coming back to the home cage, but not before or during the sessions; (b) dark onset was followed by a sharp increase in intake, declining towards light onset for alcohol but not for water. The amounts and times of ethanol intake suggest that corticosterone may mediate stress-related ethanol preference in rats.—*Journal abstract.*

4790. Hogan, J. A. (U Toronto, Ontario, Canada) **Responses in Pavlovian conditioning studies.** *Science*, 1974(Oct), Vol 186(4159), 156-157.—Presents data from observations of a broody hen with young chicks which challenge E. A. Wasserman's (see PA, Vol 51:4761) conclusion, based on findings with similar chicks, that approach and contact of conditioned stimuli does not depend on similar conditioned or unconditioned stimulus-controlled responses. The present observations indicate that the behavior of Wasserman's chicks toward a lighted key was a part of normal heat-seeking behavior redirected toward a new stimulus, and not a new determinant of the form and direction of the conditioned responses in conditioning studies.

4791. Jobe, Jared B. & Mellgren, Roger L. (U Oklahoma) **Successive nonreinforcements (N-length) and resistance to extinction at spaced trials.** *Journal of Experimental Psychology*, 1974(Oct), Vol 103(4), 652-657.—Investigated the effects of number of nonreinforced trials prior to reinforcement (N-length) at spaced trials. In Exp I with 32 male Sprague-Dawley albino rats, 120 acquisition trials were used, and in Exp II with an additional 32 Ss, 24 acquisition trials were used, both with an intertrial interval of 30 min. One half of each group ran in a gray runway and goal box and one half in the gray runway with a striped goal box. In the gray goal-box condition after 120 acquisition trials, Ss receiving N-lengths of 1, 2, and 3 were more resistant to extinction than Ss receiving only N-lengths of 3, but after 24 acquisition trials Group N<sub>1</sub>-length Ss were more resistant. In the striped goal-box condition there were no differences in resistance to extinction in either case. (15 ref)—*Journal abstract.*

4792. Kaufman, Michael C.; Aderman, Morris & Wolach, Allen H. (Southwest Coll, Chicago, IL) **Punishment as a variable in sequential learning.** *Australian Journal of Psychology*, 1974(Aug), Vol 26(2), 121-130.—48 male Sprague-Dawley rats were given runway acquisition training for either 8 or 20 days with either 1 of 2 sequences containing N (nonreinforced), R (reinforced), and P (punished) trials. One sequence had a single NP-length (always the same number of N trials followed by the same number of P trials) of 6. The other sequence had multiple NP-lengths of 2, 4, and 6. Differences in running speeds during extinction between groups trained with either the single or the multiple NP-length sequence were not significant for either level of acquisition training. During acquisition, differences in running speeds as a function of stimulus condition (N, P, or R) were observed in both the single and multiple NP-length groups. Results are discussed in terms of sequential reinforcement theory.—*Journal abstract.*

4793. Labarba, Richard C.; Fernandez, Betty; White, Jerry L. & Stewart, Allan. (U South Florida) **The effects**

of neonatal tactile stimulation on adult emotional reactivity in BALB/c mice. *Developmental Psychobiology*, 1974(Sep), Vol 7(5), 393-398.—Attempted (a) to isolate tactile stimulation as a major independent variable treatment and (b) to investigate the effects of 2 levels of neonatal tactile stimulation on the ontogenesis of emotional reactivity in 18 litters of 5 BALB/c mice. Findings strongly indicate differential reactivity as a function of intensity of tactile stimulation, with moderate levels of intensity producing the lowest levels of emotionality and the highest levels producing the highest emotionality.—*Journal abstract*.

4794. Mason, Mildred & Wilson, Martha. (U Connecticut) Temporal differentiation and recognition memory for visual stimuli in rhesus monkeys. *Journal of Experimental Psychology*, 1974(Sep), Vol 103(3), 383-390.—Reports 3 experiments using a matching-to-sample procedure. Ss were 3 rhesus monkeys in Exp I, plus 3 others in Exps II and III. Exps I and II studied identification of visual stimuli in a 2-alternative task as a function of the frequency of presentation of each specific stimulus within a fixed unit of time. Identification performance was found to be an inverse function of frequency of presentation. Exp III manipulated frequency of presentation by employing 2 information loads (4 and 6 alternatives) in an attempt to assess the relative contributions of facilitation from improved temporal differentiation and interference from an increased number of stimuli. Results are interpreted as showing that recognition is mediated by retrieval of temporal information encoded with the stimulus.—*Journal abstract*.

4795. McHale, Maureen A. & Wolach, Allen H. (Northwestern State U Louisiana) Successive acquisitions and extinctions: N-length and transition time. *Japanese Psychological Research*, 1974(May), Vol 16(1), 29-39.—Ran a total of 128 naive male Sprague-Dawley rats in a shuttle runway using a successive acquisition and extinction paradigm with short delays between trials. In Exp I, 4 groups of Ss experienced 100, 87.5, 62.5, or 37.5% reinforcement. Daily acquisition sessions were followed by extinction sessions. Ss in Exp II experienced nonreinforcement-lengths (N-lengths) of 0 (100% reinforcement), 1, 2, or 1, 2, and 3 during successive acquisitions. Ss with N-lengths of 0 and discriminative nonreinforcement-reinforcement (N-R) vs N-N transition times did not produce increasing resistance to extinction across extinctions in either experiment. Partial reinforcement factors other than N-length during acquisition determined successive extinction performance.—*Journal abstract*.

4796. McHewitt, Earl R. (Bard Coll) Reward shift effects in differential conditioning. *Journal of Experimental Psychology*, 1974(Oct), Vol 103(4), 646-651.—A total of 120 naive female Holtzman albino rats received differential large (L) and small (S) or nondifferential L or S reward training in a nonchoice brightness discrimination apparatus. Following 72 trials, reward conditions were changed according to a factorial manipulation of preshift reward conditions (LL, LS, and SS), postshift reward in the bright alley (L and S), and postshift reward in the dark alley. Results indicate typical simultaneous contrast effects in preshift, an effect of the preshift

contrast manipulation on postshift speeds—decreasing postshift speeds, successive negative contrast effects for both the LL and LS preshift conditions, and functionally similar effects of a reward increase following both differential and nondifferential conditioning. This pattern of findings, indicating independence between simultaneous and successive contrast effects, is discussed in terms of implications for present models of differential conditioning.—*Journal abstract*.

4797. Misanin, James R.; Chubb, Lyle D.; Quinn, Sharon A. & Schweikert, G. Edward. (Susquehanna U) An apparatus and procedure for effective instrumental training of neonatal and infant rats. *Bulletin of the Psychonomic Society*, 1974(Sep), Vol 4(3), 171-173.—Describes an apparatus and procedure for the escape training of neonatal rats. In this apparatus, 20 5- and 7-day-old Wistar albino rats improved their performance in terms of a speed increase over a 25-trial training session. A procedure for active avoidance training in the same apparatus is also described; its effectiveness was demonstrated in the behavior of 10 trained 10-day-old Ss relative to that of yoked controls. The appropriateness of the described apparatus for the instrumental training of neonatal and infant rats is discussed in relation to that of other apparatuses that have been used for this purpose. (15 ref)—*Journal abstract*.

4798. Mitchell, Denis; Williams, Kipling D. & Sutter, Juli. (U Washington) Container neophobia as a predictor of preference for earned food by rats. *Bulletin of the Psychonomic Society*, 1974(Sep), Vol 4(3), 182-184.—In a counterbalanced design, 16 male Long-Evans rats were alternately tested for container neophobia and preference for earned food. Testing for earned food preference was conducted after 3 exposures to the free food source followed by 7 exposures to the earned food source in an operant conditioning chamber. Testing for container neophobia was conducted in home cages after 21 sessions of habituation to a familiar container. There was a significant positive correlation between preference for earned food and container neophobia.—*Journal abstract*.

4799. Poulos, C. X. & Gromezano, I. (U Toronto, Ontario, Canada) Effects of partial and continuous reinforcement on acquisition and extinction in classical appetitive conditioning. *Bulletin of the Psychonomic Society*, 1974(Sep), Vol 4(3), 197-198.—Conducted a study with 24 albino rabbits to determine the effects of a continuous and random 50% schedule of reinforcement on classical appetitive conditioning and extinction of the Ss' jaw movement responses. It was found that partial reinforcement led to a slower rate of acquisition, lower asymptotic level, and slower rate of extinction. Findings are discussed with regard to incentive theory and stimulus aftereffects accounts of partial reinforcement effects in instrumental reward conditioning.—*Journal abstract*.

4800. Schrier, Allan M. (Brown U, Walter S. Hunter Lab of Psychology) Transfer between the repeated reversal and learning set tasks: A reexamination. *Journal of Comparative & Physiological Psychology*, 1974(Nov), Vol 87(5), 1004-1010.—Trained 16 stump-tailed and 4 rhesus monkeys to a high level of performance on a repeated reversal (RR) task, either

with or without overtraining on each reversal; Ss were then shifted to a learning set (LS) task. There was a substantial amount of positive transfer between the 2 tasks, but initial LS performance was well below the level that would be expected if RR training were equivalent to LS training. Results for control groups indicate that there was little, if any, nonspecific transfer between the 2 tasks. Overtraining facilitated performance of the stump-tailed monkeys on the RR task. (17 ref)—*Journal abstract*.

4801. Shimp, Charles P. & Menlove, Ronald L. (U Utah) **Contrast as a function of component duration.** *Bulletin of the Psychonomic Society*, 1974(Sep), Vol 4(3), 193-194.—Studied behavioral contrast in 3 White Carneaux pigeons as a function of the duration of 2 components of a multiple schedule: a constant component (a variable-interval 1-min schedule) alternated either every 5 sec or every 180 sec with a variable component (a variable-interval 1-min or an extinction schedule). The rate at which Ss pecked for food during the constant component revealed a strong reinforcement interaction when component duration was 5 sec, but not when component duration was 180 sec. Results add to previous findings that component duration in concurrent and concurrent-like schedules of reinforcement affects both preference for a component and reinforcement interactions between components.—*Journal abstract*.

4802. Singh, Sheo D. & Lewis, Jonathan K. (Meerut U, Inst of Advanced Studies, Primate Research Lab, India) **An evaluation of transfer suppression phenomenon at different stages of learning-set formation.** *Primates*, 1974(Sep), Vol 15(2-3), 205-208.—3 groups of 3 rhesus monkeys each trained to varying levels of object discrimination learning-set formation were tested for reversal-learning proficiency. Training consisted in presenting discrimination problems by the usual learning-set procedure; reversal-learning proficiency was tested by presenting the reversal problems along with control problems according to the usual learning-set procedure and also according to the serial-learning procedure. No substantial change in negative interproblem transfer effects was observed as a result of learning-set proficiency, as reversed-problem performance remained significantly poorer than control-problem performance at all the levels. Learning of a reversed problem was not in any way related to an S's correct or incorrect response on its 1st acquisition trial.—*Journal abstract*.

4803. Tombaugh, Tom. (Carleton U, Ottawa, Ontario, Canada) **The interactive effects of type of deprivation and sucrose concentration on the acquisition and extinction performance in the rat.** *Canadian Journal of Psychology*, 1974(Sep), Vol 28(3), 351-358.—In a discrete-operant barpress situation with 128 female albino Sprague-Dawley rats, 4 types of deprivation (food, water, water plus food, and no deprivation) were combined factorially with 4 levels of reward (0, 4, 16, and 64% sucrose concentration). In acquisition, water (0% sucrose) served as an effective reinforcer only when Ss were deprived of water alone. Higher sucrose concentrations tended to produce correspondingly higher levels of performance when food, water plus food, and no deprivation were used. No such differences were obtained with water deprivation. Resistance to extinction

was an increasing function of sucrose concentration when Ss were deprived of food and water plus food. No differences were observed under the other 2 deprivation conditions. (French summary) (21 ref)—*Journal abstract*.

4804. Wachs, Theodore D. (Purdue U) **Visual exploratory behavior as a function of early handling, sex, and level of auditory prestimulation.** *Developmental Psychobiology*, 1974(Sep), Vol 7(5), 385-392.—Attempted to determine whether or not early handling could "buffer" animals against intense stimulation effects. At birth, Maudsley nonreactive rat strain pups were assigned to either a handling or a nonhandling condition. As adults, they received either intense, moderate, or no stimulation prior to being allowed 3 min of visual exploration. It was predicted that (a) handled Ss would show significantly more exploration than nonhandled Ss; (b) intensely stimulated Ss would show significantly less exploration than Ss receiving lower amounts of stimulation; and (c) handled Ss, under intense stimulation, would show significantly more exploration than nonhandled Ss under intense stimulation. Results support (b) and (c). The 1st prediction was supported but was complicated by a Sex  $\times$  Handling interaction. (29 ref)—*Journal abstract*.

4805. Wilson, Linda M.; Phinney, Richard L. & Brennan, James F. (Kent State U) **Age-related differences in avoidance behavior in rats following CS preexposure.** *Developmental Psychobiology*, 1974(Sep), Vol 7(5), 421-427.—40 male Holtzman albino weanling and adult rats were exposed to either 0 or 10 conditioned stimulus (CS) presentations prior to 1-way active-avoidance training. Although CS exposure retarded avoidance acquisition in the adults, it produced no effect in the pups during avoidance learning. Neither adult nor young Ss demonstrated preexposure effects in extinction. A general extinction analysis showed that pups had less resistance to extinction than adults, despite a comparable avoidance learning criterion between age groups. Lack of preexposure influences on performance by the pups is compared to previous findings of response inhibitory deficits in immature rats. Results are considered in light of selective attention interpretations of latent inhibition. (22 ref)—*Journal abstract*.

### Social & Sexual Behavior

4806. Adkins, Elizabeth K. (Bucknell U) **Electrical recording of copulation in quail.** *Physiology & Behavior*, 1974(Sep), Vol 13(3), 475-477.—An automatic method previously used with rats and rabbits was used to record genital contacts between pairs of copulating Japanese quail. Copulation typically consisted of a single brief (1 sec or less) contact. Ejaculatory and nonejaculatory contacts did not differ. Contacts between pairs of males were briefer than contacts with female partners, but contacts with estrogen-treated male partners were similar to contacts with female partners. (18 ref)—*Journal abstract*.

4807. Barash, David P. (U Washington) **Mother-infant relations in captive woodchucks (*Marmota monax*).** *Animal Behaviour*, 1974(May), Vol 22(2), 446-448.—Studied mother-infant relations in 3 litters of woodchucks from birth until about 1 wk after dispersal normally occurs in nature. Weaning correlated with

dispersal age and with an increase in aggressive mother-infant relations and a decrease in solicitous behavior.

4808. **Burton, Frances D. & Sawchuk, Lawrence A.** (U Toronto, Scarborough Coll, Ontario, Canada) **Demography of *Macaca sylvanus* of Gibraltar.** *Primates*, 1974(Sep), Vol 15(2-3), 271-278.—Analyzes the demographic structure of Gibraltar macaques over a 21-yr period in light of human interference on this population. Social behavior is examined in terms of its influence on the parameters investigated, and speculations are made concerning the nature of homeostatic processes operating in a nonwild group. (20 ref)

4809. **Carr, W. J.** (Beaver Coll) **Pheromonal sex attractants in the Norway rat.** In L. Krames, P. Pliner & T. Alloway (Eds), *Nonverbal communication*. New York, NY: Plenum Press, 1974. x, 212 p. \$14.95.—Summarizes research on odors as sex attractants in Norway rats (*Rattus norvegicus*). The conditions under which male and female rats respond are explored. (4 p ref)

4810. **Chevalier-Skolnikoff, Suzanne.** (U California, Langley Porter Neuropsychiatric Inst, San Francisco) **The ontogeny of communication in the stump-tail macaque (*Macaca arctoides*).** Basel, Switzerland: S. Karger, 1974. ix, 174 p.

4811. **Coelho, Anthony M.** (Texas Tech U) **Sociobioenergetics and sexual dimorphism in primates.** *Primates*, 1974(Sep), Vol 15(2-3), 263-269.—Suggests that sociobioenergetics is a practical method of estimating energy budgets of primates in a social context. Data on a captive colony of Sykes' monkeys and baboons are incorporated as illustrations of the possible effects of group composition, body size, reproductive status, and activity patterns on energy requirements. (19 ref)

4812. **Deets, Allyn C. & Harlow, Harry F.** (U Pittsburgh) **Adoption of single and multiple infants by rhesus monkey mothers.** *Primates*, 1974(Sep), Vol 15(2-3), 193-203.—8 multiparous rhesus mothers were separated from their biological offspring within hours following parturition, and 2½ days later, on the average, they were offered neonates for adoption. These 12 male foster infants had been separated from their biological mothers shortly after birth and averaged 2½ days old when subjected to adoption. Mothers that were offered a single neonate immediately and completely adopted the foster infant, but mothers that were offered 2 infants at the same time were ambivalent. Many infants were rejected initially, although with 1 partial exception, the mothers eventually accepted and cared for 2 infants. It is concluded that the macaque maternal affectional system may be biased toward accepting and nurturing 1 infant at a time. (15 ref)—*Journal abstract*.

4813. **Deets, Allyn C.** (U Pittsburgh, Lab of Clinical Science) **Age-mate or twin sibling: Effects on monkey age-mate interactions during infancy.** *Developmental Psychology*, 1974(Nov), Vol 10(6), 913-928.—12 rhesus monkey infants were reared with a mother and nonsibling peers; 8 had an age-mate or twin sibling, while 4 control infants did not. The twin sibling relationship was produced experimentally by pairing infants at birth and fostering them 2 to a mother; the control infants were also paired but fostered 1 to a mother. Positive affiliation with the paired rearing partner began earlier in the twin group and continued at higher levels throughout a 7-mo

period of observation. The twins also engaged in more positive affiliation with age-mates other than the rearing partner, while the control infants more frequently engaged in solitary activities and displayed more aggressive and submissive behavior. It is concluded that the age-mate sibling had a beneficial effect upon early social development. (31 ref)—*Journal abstract*.

4814. **Deutsch, Joan & Larsson, K.** (Inst of Animal Behavior, Newark, NJ) **Model-oriented sexual behavior in surrogate-reared rhesus monkeys.** *Brain, Behavior & Evolution*, 1974, Vol 19(3), 157-164.—2 male and 2 female surrogate- and 10 mother-reared rhesus monkeys were exposed to a stationary cloth-covered model. All of the surrogate-reared Ss displayed social and sexual patterns toward the object, but the mother-reared Ss did not. While the surrogate-reared males performed repeated mounts on the object, one of them was capable of consistently performing complete sequences of properly oriented mounts interspersed with grooming and terminating in ejaculation. When tested with female monkeys, neither of the surrogate-reared males performed repeated mounts. The establishment and maintenance of contact requisite for sexual interaction with the females appeared to be prevented by the surrogate-reared males' tendencies to either passivity and withdrawal or erratic aggressiveness. Since the presence of a reciprocally active female monkey disrupted the expression of sexual patterns elicited by the unresponsive model, it is suggested that early adjustment to a noninteractive mother interferes primarily with the surrogate-reared monkey's perception of the social object and ability to organize interactive social events.—*Journal abstract*.

4815. **Erwin, J.; Maple, Terry; Mitchell, G. & Willott, J.** (U Washington, Primate Field Station, Medical Lake) **Follow-up study of isolation-reared and mother-reared rhesus monkeys paired with preadolescent conspecifics in late infancy: Cross-sex pairings.** *Developmental Psychology*, 1974(Nov), Vol 10(6), 808-814.—8 rhesus monkeys, 4 of each sex, which had been reared either with their mothers or in social isolation during early infancy, were paired with preadolescent conspecifics during late infancy. Some isolate-reared Ss appeared to have gained from this social experience. At nearly 3 yrs of age, each S was paired (sequentially) with 2 other-sex animals (1 isolate- and 1 mother-reared) after having been housed alone for the entire 2nd (and most of the 3rd) yr of life. Little social interaction occurred between the members of any pair. Several significant effects of rearing experience indicated that social experience with preadolescents in late infancy did not permanently reverse the deleterious effects of early isolation. However, the mother-reared Ss also failed to establish social rapport with one another. Comparison of these results with those of similar research employing mother-reared animals which had received supplemental social experience during the 2nd yr of life suggests that such social experience is of some importance for optimal development of later sociosexual behavior.—*Journal abstract*.

4816. **Fittinghoff, N. A.; Lindburg, D. G.; Gomber, J. & Mitchell, G.** (U California, Davis) **Consistency and variability in the behavior of mature, isolation-reared, male rhesus macaques.** *Primates*, 1974(Sep), Vol 15(2-3), 111-139.—Indicates that self-punishments, hy-

peraggressiveness, stereotyped behaviors, bizarre movements, and masturbation were more typical of 6 adult-male isolates than of 5 adult-male wild-born rhesus controls. These differences persisted into the 13th year. Social exploration and cage-shaking were depressed in isolates. A number of speculative explanations are offered for many isolate behaviors. An individual S's abnormalities not only changed but decreased with age, and the kinds and frequencies of abnormalities decreased as isolates habituated to a new situation. The behavior of controls was much less variable than was the behavior of isolates. Isolate abnormalities are viewed as "normal" responses to an altered ecology. (24 ref) —*Journal abstract.*

4817. Gouzoules, Harold T. (Arashiyama West, Primate Research Ranch, Laredo, TX) **Group responses to parturition in *Macaca arctoides*.** *Primates*, 1974(Sep), Vol 15(2-3), 287-292.—Describes the birth of an infant to the highest ranking female in a captive social group of stump-tail macaques. Along with certain details of delivery behavior, the responses of group members to the birth are given.

4818. Horwich, Robert H. (Inst of Micro-ontogenetic Ethology & Macro-cosmological Ecology, La Grange Park, IL) **Regressive periods in primate behavioral development with reference to other mammals.** *Primates*, 1974(Sep), Vol 15(2-3), 141-149.—Results of studies on behavioral development in 12 species of monkeys indicate normal fluctuations of high frequency of nipple contact. These periods decreased in intensity as the infant developed and occurred at similar times in development in the 12 species. Literature on 11 species of primates and 3 species of nonprimates indicates similar regressions in mother-infant contact, which implies a common genetic basis for the phenomenon. (26 ref) —*Journal abstract.*

4819. Horwich, Robert H. (Inst of Micro-ontogenetic Ethology & Macro-cosmological Ecology, La Grange, Park, IL) **Development of behaviors in male spectacled langur (*Presbytis obscurus*).** *Primates*, 1974(Sep), Vol 15(2-3), 151-178.—Observed a male infant langur in a group setting, from birth until 1 yr of age. Frequency or duration of 30 behaviors was recorded during 2-hr periods and plotted chronologically. The Maternal Care Period (0-20 days) was characterized by close mother-infant contact, including a great deal of nipple contact and a high frequency of maternal behaviors. The Individuation Period (21-70 days) was typified by maternal restraint and retrieval and by independence and self-oriented behaviors like scratching, mouthing, and locomotory skills. The Socialization Period (71-240 days) was manifested by behavioral fluctuations, involving nipple contact, play, and care by other troop members and coincided with the molt from infant to juvenile pelage. During the Juvenile Period, the mother-infant distance increased and the mother interacted more with other troop members. Behavioral fluctuations are discussed with reference to other primates studied. (39 ref) —*Journal abstract.*

4820. Krames, Lester; Pliner, Patricia & Alloway, Thomas (Eds.). (Erindale Coll, U Toronto, Ontario, Canada) **Nonverbal communication.** New York, NY: Plenum Press, 1974. x, 212 p. \$14.95.

4821. Marler, Peter. (Rockefeller U, Ctr for Field Research in Ethology & Ecology, New York, NY) **Animal communication.** In L. Krames, P. Pliner & T. Alloway (Eds.), *Nonverbal communication.* New York, NY: Plenum Press, 1974. x, 212 p. \$14.95.—Reviews and discusses literature on animal signals, genetics of social cooperation, the design of animal societies, and related topics. It is suggested that the key to acquiring understanding of animal communication lies in better knowledge of the organization of animal societies. (31 ref)

4822. Masur, Jandira & Struffaldi, Gina. (Escola Paulista de Medicina, São Paulo, Brazil) **Division of labor between rats: Influence of differential social rearing conditions.** *Behavioral Biology*, 1974(Oct), Vol 12(2), 233-241.—Previous studies have shown that when pairs of rats are placed in a modified Skinner box with the water dipper and the bar attached on opposite walls, one of the rats usually becomes the worker, performing most of the barpresses, while the partner receives the reward without working (parasite rat). The influence of differential social-rearing condition on this peculiar division of labor was studied in the present 2 experiments with a total of 76 male Wistar rats. In Exp I, the development of the worker-parasite relationship was compared between pairs made up of 2 isolated- or 2 nonisolated-raised rats. Isolated Ss reacted to the presence of another isolated S through searching physical contact which led to a different pattern of development of the division of labor when compared to pairs made up by 2 socially raised Ss. In Exp II, in which each pair was made up of 1 isolated and 1 nonisolated S, the isolated became parasite. The stability of the worker-parasite relationship and the behavior of 2 parasites or 2 workers when tested together in the "social situation" was also analyzed. —*Journal abstract.*

4823. Maurus, M.; Hartmann, E. & Kuhlmann, B. (Max-Planck-Inst for Psychiatry, München, W Germany) **Invariant quantities in communication processes of squirrel monkeys.** *Primates*, 1974(Sep), Vol 15(2-3), 179-192.—Invariant quantities provide the basis for recognizing generally valid rules for intraspecific communication among squirrel monkeys. These invariant quantities, independent of individual characteristics of the animals or the animal groups, give rise to the following rules: (a) The behavior units, set up according to a physical description of movements and postures involved, are not directed from each animal towards every partner in arbitrary frequency. Rather, each behavior unit is characterized through being distributed in definite frequency relations among the partners. (b) Not only "what" is done is significant, but also "who" does it and toward "whom" it is done. (c) The hierarchical rank of animals correlates with the variability with which the animals use the given behavior units. (d) Behavior units resembling each other have similar functions in the communication processes. (e) Behavior units definitely differing from each other have different functions in the communication processes. (28 ref) —*Journal abstract.*

4824. McKinney, William T. (U Wisconsin, Medical School, Madison) **Primate social isolation: Psychiatric implications.** *Archives of General Psychiatry*, 1974(Sep).

Vol 31(3), 422-426.—A review of the literature shows that social isolation of rhesus monkeys for the 1st 6-12 mo of life produces severe and persistent behavioral effects including social withdrawal, rocking, huddling, self-clasping, stereotyped behaviors, and inappropriate heterosexual and maternal behaviors as adults. The mechanisms by which these effects are produced are uncertain and require additional investigations. The social isolation syndrome has been likened to several human psychopathological states, but exact labeling of it in human terms is premature at present. It is suggested that the syndrome be viewed in terms of its heuristic value as a model system for further clarifying the interactions among early rearing conditions, their possible neurobiological consequences, and subsequent social behaviors. (41 ref)—*Journal abstract*.

4825. Miller, Robert E. (U Pittsburgh) **Social and pharmacological influences on the nonverbal communication of monkeys.** In L. Krames, P. Pliner & T. Alloway (Eds), *Nonverbal communication*. New York, NY: Plenum Press, 1974. x, 212 p. \$14.95.—Investigated variables affecting nonverbal communication and related individual nonverbal fluency with social and physiological performances in tests on rhesus monkeys. Stimulant, tranquilizer, and psychotomimetic drugs were used. Drugs affecting transmission or reception of affective expression also altered group social patterns. Undrugged Ss responded to treated Ss differentially depending on the drug used. (41 ref)

4826. Nash, Leanne T. (Arizona State U) **Parturition in a feral baboon (*Papio anubis*).** *Primates*, 1974(Sep), Vol 15(2-3), 279-285.—During a study of feral Tanzanian baboons, the premature birth of a dead, breechborn infant was observed and photographed. The birth attracted little attention from other troop members, but the dead infant was carried by the mother for 2 days and was investigated by several baboons, including 3 females who had recently become dominant to the mother in a fight. (18 ref)

4827. Reynierse, James H. (Hope Coll) **Communication elements constraining animal learning and performance.** In L. Krames, P. Pliner & T. Alloway (Eds), *Nonverbal communication*. New York, NY: Plenum Press, 1974. x, 212 p. \$14.95.—Reviews literature on the function of odors, generality of discrimination and cue effects, generality of pheromonal effects, and agonistic postures. It is concluded that performance on several appetitive learning tasks is clearly constrained by odors associated with nonreward, an effect that parallels ecologically adaptive behavior of animals in the wild. (3 p ref)

4828. Savage, E. S.; Temerlin, J. W. & Lemmon, W. B. (U Oklahoma, Inst for Primatological Studies) **Group formation among captive mother-infant chimpanzees (*Pan troglodytes*).** *Folia Primatologica*, 1973, Vol 20(5-6), 453-473.—Studied interaction patterns of 3 adult female chimpanzees and their offspring before and after they were caged as a group. Aggression was of low intensity during group formation. Mother-infant interaction patterns changed as a function of group caging: (a) Infants broke contact with their mothers more frequently. (b) Mothers initiated fewer breaks in contact with their infants. (c) Duration of mother-infant contact

increased. (d) Grooming of mobile infants became infrequent. (e) Both duration of play and variety of play patterns increased. Mothers were aggressive toward neither their own nor other mothers' infants after group formation, and they carried and occasionally nursed infants of other mothers. Other cooperative or altruistic behaviors are described. Peer play was reciprocal, but infants playing with mothers were typically passive after initiating play.—*W. K. Redican*.

4829. Tavalga, William N. (American Museum of Natural History, New York, NY) **Application of the concepts of levels of organization to the study of animal communication.** In L. Krames, P. Pliner & T. Alloway (Eds), *Nonverbal communication*. New York, NY: Plenum Press, 1974. x, 212 p. \$14.95.—Reviews the literature and explores an organizational level approach to animal communication research. Topics include the energy source (the emitter), the energy receiver (the responder), and various levels of organization (e.g., vegetative, tonic, and symbolic). It is suggested that research must examine each species as a unique product of natural selection in its own right. (3 p ref)

4830. Uematsu, T. & Saito, K. (Kagawa U, Faculty of Education, Takamatsu, Japan) **[Social facilitation of feeding behavior in the fresh water fish: II. Medaka *Oryzias latipes*.]** *Japn Annual of Animal Psychology*, 1973(Dec), Vol 23(1), 43-47.—Studied social facilitation in 28 "medaka" (Japanese freshwater fish). Food intake in a 10-min period, after 24-hr food deprivation, increased in the presence of 1 or 3 other fish on the opposite side of a glass wall. Results indicate social facilitation under a high-drive condition.—*S. Nakajima*.

4831. Vandenberg, John G. & Drickamer, Lee C. (North Carolina Dept of Mental Health, Research Div, Raleigh) **Reproductive coordination among free-ranging rhesus monkeys.** *Physiology & Behavior*, 1974(Sep), Vol 13(3), 373-376.—Reports that 2 female rhesus monkeys in 1 free-ranging social group were brought into sexual receptivity with estradiol benzoate during the nonmating season of the year. The presence of sexually active females resulted in increased sexual behavior and reddening of sex skin among the adult males in the experimental group. The effects were most intense for males of high social rank. These changes occurred while 2 other social groups were sexually quiescent, 2 mo before the normal onset of mating activity. In the birth season following this wave of induced sexual activity, untreated females in the experimental group delivered infants 1 mo earlier than in control groups.—*Journal abstract*.

4832. Vandenberg, John G. (Dorothea Dix Hosp, Div of Mental Health Services, Raleigh, NC) **Social determinants of the onset of puberty in rodents.** *Journal of Sex Research*, 1974(Aug), Vol 10(3), 181-193.—The age at which female mice reach puberty depends on prior experience with male stimuli; females exposed to male odors hasten their maturation. The effects of social stimuli on the process of sexual maturation of mice are discussed. (18 ref)

4833. Wenner, Adrian M. (U California, Santa Barbara) **Information transfer in honey bees: A population approach.** In L. Krames, P. Pliner & T. Alloway (Eds), *Nonverbal communication*. New York, NY: Plenum

Press, 1974. x, 212 p. \$14.95.—Examines anomalous findings and other data to delineate the experimental problems of this research. A model is proposed concerning the flight patterns of recruit bees, and methods of testing it are suggested. (37 ref)

4834. Zack, Sheldon. (Max Planck Inst for Behavioral Physiology, Seewiesen, W Germany) **The effects of food deprivation on agonistic behavior in an opisthobranch mollusc, *Hermisenda crassicornis*.** *Behavioral Biology*, 1974(Oct), Vol 12(2), 223-232.—Observed the encounters occurring among molluscs which had been deprived of food for 1-3 days. Although deprivation resulted in an increase of locomotor activity, there was not a corresponding increase in the number of encounters. Deprivation greatly increased the proportion of agonistic encounters. As the deprivation period increased from 1 to 3 days, the proportion of agonistic encounters involving biting increased while the proportion of agonistic encounters without biting decreased. The overall proportion of agonistic encounters of both types appeared unchanged by the length of the deprivation. (23 ref)—*Journal abstract*.

### Sensory Processes

4835. Booth, D. A.; Stoloff, Robert & Nicholls, Joy. (U Birmingham, England) **Dietary flavor acceptance in infant rats established by association with effects of nutrient composition.** *Physiological Psychology*, 1974(Sep), Vol 2(3-A), 313-319.—In 4 experiments, cross-bred Sprague-Dawley-derived albino rat pups came to accept a starch-containing diet and to prefer its flavor or other sensory properties, even when they also had access to the laboratory chow on which their mother was maintained. Protein induced acceptance somewhat more weakly, triglyceride not at all under the conditions used. Nutrient-free material became aversive. It is concluded that at least part of the acceptability of a food is an augmentation of its power to elicit ingestory reactions, which has been established by the contingency of physiological effects of ingested carbohydrate or protein on experiences of that foodstuff's distinctive sensory qualities. (38 ref)—*Journal abstract*.

4836. Kavanau, J. Lee & Peters, Charles R. (U California, Los Angeles) **Primate locomotor pattern repetitions, program clocks, and orientation to light.** *Primates*, 1974(Sep), Vol 15(2-3), 209-217.—Observed that remarkable locomotor pattern repetitions by small nocturnal primates (1 owl monkey, 3 slow lorises, and 3 bush babies) in 122-cm activity wheels occurred during 4-hr light cycles with simulated twilights. Some of the repetitions owed their genesis almost entirely to a night-to-night concurrence of endogenous timing programs. Others depended on strong tendencies of the Ss to orient relative to the position of light sources and enclosure environment. Still others were based partly on influences of twilight illuminance level on speed of locomotion. In many aspects the primate locomotor behavior was very similar to that of previously studied rodents and carnivores.—*Journal abstract*.

4837. Luschei, Erich S. & Goodwin, Guy M. (U Washington, Regional Primate Research Ctr) **Patterns of mandibular movement and jaw muscle activity during mastication in the monkey.** *Journal of Neurophysiology*,

1974(Sep), Vol 37(5), 954-966.—Studied patterns of mandibular movement, masticatory muscle activity, and rates of chewing different foods in 5 adolescent rhesus monkeys. The typical pattern during steady mastication of monkey biscuit involved a rapid upward and lateral movement of the tip of the mandible to a point 4 mm below and lateral to the point of occlusion, then a slower upward and medial-directed movement into occlusion. Mastication may be a useful natural behavior for studying the neural control of movement. (17 ref)

4838. Mook, Douglas G. (U Virginia) **Saccharin preference in the rat: Some unpalatable findings.** *Psychological Review*, 1974(Nov), Vol 81(6), 475-490.—A review of the literature and the author's experiments suggest that preferences for sweet solutions, at least in the rat, may reflect the "informational" rather than the "hedonic" properties of sweetness. Whereas saccharin-sweetened water is nearly always preferred to plain water, a saccharin-sweetened liquid diet is seldom preferred to a bland one. Ceiling and masking effects are not responsible for this. Perhaps sweetness identifies a fluid (even a nonnutritive one) as food, so that if other such cues are already present, sweetness is redundant and is ignored. If so, the distinction between the "sensory" and "motivating" properties of taste may be less sharp than previously supposed. (61 ref)—*Journal abstract*.

### DEVELOPMENTAL PSYCHOLOGY

4839. Andersson, Bengt-Erik. (U Göteborg, Inst of Educational Research, Sweden) **Older and younger generations' views of each other: A study in misunderstandings.** *Scandinavian Journal of Educational Research*, 1974, Vol 18(3), 117-132.—Presents 4 Swedish studies of real or perceived differences in the way older and younger generations look upon each other. A total of 455 16-20 yr olds and 548 40-60 yr olds in different groups rated their views of adolescents and adults and their perception of the opposite generation's ratings. Results show no real gap between the generations in their ratings of the opposite generation. However, there appeared to be a perception gap (i.e., the generations had a mistaken perception of the opposite generation's ratings). The adolescents particularly expected the adults to have a clearly negative view of youth while at the same time they believed the adults to have a high opinion of themselves, a perception that was not supported by the data. This misperception decreased among older adolescents and working youth.—*Journal abstract*.

4840. Barroso, Felix & Braine, Lila G. (New York U) **"Mirror-image" errors without mirror-image stimuli.** *Journal of Experimental Child Psychology*, 1974(Oct), Vol 18(2), 213-225.—Recent work has indicated that discrimination between upright and inverted stimuli is difficult when stimuli are one above the other, and discrimination between stimuli turned left and right is difficult when stimuli are side by side (i.e., errors are frequent under conditions in which mirror-image confusions can be made). 85 3-, 4-, and 5-yr-old children were given a task requiring the matching of orientation of (a) identical realistic figures that could form mirror images

of each other or (b) nonidentical realistic figures that could not form mirror images. The same pattern of errors appeared for the identical and nonidentical figures, indicating that the errors were not mirror-image confusions. It is argued that the errors were due to a strategy of matching analogous parts of the 2 figures. (22 ref)—*Journal abstract*.

4841. Bee, Helen L. (Ed.). **Social issues in developmental psychology**. New York, NY: Harper & Row, 1974. x, 438 p.—Presents a collection of 22 discussion and empirical papers on sex differences in child development, working mothers and day care, the effects of poverty, compensatory education, the role of fathers in development, and the effects of paternal absence.

4842. Bench, John; Hoffman, Eric & Wilson, Ian. (Royal Berkshire Hosp, Regional Audiology Research Unit, Reading, England) **A comparison of live and videorecord viewing of infant behavior under sound stimulation: I. Neonates**. *Developmental Psychobiology*, 1974(Sep), Vol 7(5), 455-464.—12 clinically normal human neonates were presented with a battery of sound stimuli while their behavior was assessed live by 2 sound-masked Os and simultaneously videorecorded. This procedure was performed for the baby's whole body aspect and also for the head aspect only. Later, the same Os assessed the behavior from the videorecords. In both situations, Os were permitted to see the babies for 10 sec at each trial. The 1st 5 sec was a prestimulus observation period and the 2nd 5 sec usually contained a sound stimulus. Between trials the Os were allowed 20 sec in which to note (a) prestimulus activity; (b) confidence in response; and (c) facial, digit, and limb movements and "wholistic" impressions. The agreement between live and video assessments was slightly better than the level of inter-O agreement. The use of videorecording caused, at most, slight losses of relevant information and apparently did not generally distort the findings.—*Journal abstract*.

4843. Bo, Ola O. (U Oslo, Norway) **Types of orthographic error: Relations between the types of error and their connections with auditory discrimination and auditory memory**. *Scandinavian Journal of Educational Research*, 1973, Vol 17(4), 95-115.—Orthographic errors made in a dictation test by 240 2nd-class Norwegian children were classified as either phonemic or nonphonemic and related to 6 predictor variables (2 discrimination, 2 memory, and 2 decoding variables). Results show that the predictors correlated slightly higher with nonphonemic than with phonemic errors, although the relationship was altered somewhat when IQ and endurance were controlled. (21 ref)

4844. Bosma, James F. (Ed.). (NIH, National Inst of Dental Research, Bethesda, MD) **Oral sensation and perception: Development in the fetus and infant: Fourth symposium**. Washington, DC: US Government Printing Office, DHEW Pub No (NIH) 73-546, 1973. xix, 419 p. \$8.55.

4845. Busse, Thomas V.; Mansfield, Richard S. & Messinger, Lee J. (Temple U) **Activities in child and adolescent development**. New York, NY: Harper & Row, 1974. xiii, 170 p.

4846. Calderone, Mary S. (Sex Information & Education Council of the US, New York, NY) **Eroticism as a norm**. *Family Coordinator*, 1974(Oct), Vol 23(4), 337-341.—Erotic feelings, thoughts, fantasies, and responses invariably occur in children from their earliest days onward, simply as a "given" to being born male or female. The attitudes of the parent figures about these and about the gender identity and role behavior of the child constitute the child's primary sex education from birth to 5 yrs of age. Sex of assignment and of rearing should be congruent, or be helped to become so, before the age of 3. In particular, most parents need to be made aware of their own crucial role in determining their child's future adult capacity for erotic response and sex object choice.—*Journal abstract*.

4847. Eisner, H. C.; Siegler, I. C. & Elsele, F. R. (Duke U, Medical Ctr) **Contemporary views on behavioral development: A review of the 1973 meetings of the International Society for the Study of Behavioral Development**. *Human Development*, 1974, Vol 17(3), 231-234.—Discusses major themes and trends in the conference, including (a) the role of history in shaping present-day conceptualizations of behavioral development, (b) the need for behavioral scientists to move outside traditional Western cultures for a fuller understanding of human growth, (c) models of cognition and preception; and (d) different aspects of the ecology of the developing individual.

4848. Escalona, Sibylle K. (Albert Einstein Coll of Medicine, Rose F. Kennedy Ctr for Research in Mental Retardation & Human Development, Yeshiva U) **Developmental issues in the second year of life: Their implications for day care practices**. *Psychosocial Process*, 1974(Spr), Vol 3(1), 28-33.—Discusses aspects of toddler behavior (children 12-24 mo old) which caretakers often misperceive, as when they view much of the toddler's independent, meaningful behavior as random restlessness. Caretakers, by keeping the toddler occupied, may also deprive him of the full opportunity to build up and consolidate autonomy and structure in his world and in himself.

4849. Fink, R. (York U, Downsview, Ontario, Canada) **Orthography and the perception of stops after s**. *Language & Speech*, 1974(Apr-Jun), Vol 17(2), 152-159.—Stimuli containing voiced or voiceless stops occurring after /s/ were presented in the form of a spelling test to 18 2nd and 14 3rd graders and 11 adults. Responses indicate that the child's perceptual categorization of these phones undergoes a change during his internalization of the rules of English orthography (i.e., at the age of 7 or 8 yrs). Results also suggest that the value of the feature of voicing assigned to these stops may not be the same for all places of articulation.—*Journal abstract*.

4850. Freedle, Roy. (Educational Testing Service, Princeton, NJ) **A general system's view of the second biennial meeting of the International Society for the Study of Behavioral Development**. *Human Development*, 1974, Vol 17(3), 235-240.—Suggests that to cover such a wide variety of ideas as were presented at the 1973 conference on behavioral development, an extremely general framework is needed; general systems theory is such a framework. It is argued that this framework has import for theorizing about the developmental process

itself. The general patterning of ideas at the conference is discussed.—*Journal abstract.*

4851. Fry, William F. (Stanford U, Medical School) **Psychodynamics of sexual humor: Sexual views of children.** *Medical Aspects of Human Sexuality*, 1974(Sep), Vol 8(9), 77-80.—Attempts to interpret the psychological aspects of children's humor, particularly in the area of sex, and to relate them to developmental changes in sexual understanding. Childhood sexual humor often emphasizes oral and anal concepts, although these are often mixed randomly with ideas about genitality. The psychodynamics of 2 types of jokes are discussed: those in which children themselves tell about sex, and those which are essentially adult jokes about childhood attitudes toward sex. Neurological, psychological, and physiological reasons for children's random association of sexual zones and functions are cited, and the normality of this developmental phenomenon is stressed.—L. Gorsey.

4852. Gyr, John W.; Willey, Richmond; Gordon, David & Kubo, Richard H. (U Michigan, Mental Health Research Inst) **Do mathematical group invariants characterize the perceptual schema of younger and older children?** *Human Development*, 1974, Vol 17(3), 176-186.—Explores whether perceptual processes of children can be viewed within a structuralist frame of reference and whether the concept of the group of transformations and related notions can be used to formulate perceptual phenomena and to predict experimental results. The following topics are discussed: (a) the benefit for perception theory to be derived from having its processes described in terms of group theory, (b) past work in perception which has used group theory, and (c) some studies by the authors which explore whether the invariance structure which underlies groups of transformations is reflected in the perceptual functioning of children. (30 ref)—*Journal abstract.*

4853. Harris, Lauren J. & Allen, Terry W. (Michigan State U) **Role of object constancy in the perception of object orientation: Some methodological considerations in studies of human infants.** *Human Development*, 1974, Vol 17(3), 187-200.—Contends that studies of human infants' sensitivity to object orientation have confounded 2 different psychological questions—one about ability to discriminate object orientation and the other about the existence of object constancy. Several examples from the recent psychological literature support the conclusion that the attempt to separate the constancy and discrimination questions in an experimental design employing only a single dependent variable fails practically and theoretically, since any such separation is predicated on an incorrect theory of constancy. A theoretically more acceptable multivariable design is outlined.—*Journal abstract.*

4854. Harris, Paul & MacFarlane, Aidan. (U Lancaster, England) **The growth of the effective visual field from birth to seven weeks.** *Journal of Experimental Child Psychology*, 1974(Oct), Vol 18(2), 340-348.—Studied visual orientation toward a peripheral stimulus by 28 newborns and 12 7-wk-old infants with both a central stimulus present and absent in 2 experiments. The presence of the central stimulus narrowed but did not eliminate peripheral responding. No age change was

found when a central stimulus was present. However, older infants exhibited greater peripheral responding than newborns when the central stimulus was absent. The neonate appears to exercise internal control over his sampling of the stimulus array rather than being passively captured by it. (18 ref)—*Journal abstract.*

4855. Hashimoto, Syoji. [A developmental study on the cognition of occupations.] (Japn) *Japanese Journal of Educational Psychology*, 1973(Sep), Vol 21(3), 187-191.—Asked 120 6th graders and 120 9th graders to rate their occupational preferences among 40 occupations on a 5-point scale. Factor analysis of the obtained data yielded 6 factors from 6th graders and 7 factors from 9th graders. Factor loadings after the rotation were obtained. Results indicate that (a) the structure of the occupational preference of these age groups has 2 dimensions, interest for the 9th graders and hierarchy for the 6th graders; and (b) the developmental trend is in the direction of occupational socialization.—S. Choe.

4856. Hayashi, Kunio. (Kyoto U, Faculty of Science, Japan) [The development of the smile in infancy.] (Japn) *Japanese Journal of Child Psychiatry*, 1972(Sep), Vol 13(5), 317-322.—Observed the smiling pattern of a female baby for 2½ mo after birth. The spontaneous smile, which is merely an expression of internal pleasure, was followed on the 40th-45th day by the smile at perceived objects occurring after needs for food were satisfied. After the 46th day this smile occurred regardless of her internal state. From the 53rd day she smiled frequently at her favorite toys, or when she was held or talked to. After the 65th day she smiled actively at people around her. Thus the innate spontaneous smile became the communicative smile, a social behavior. (English summary)—S. Ohwaki.

4857. Herbert, Martin. (U Leicester, School of Social Work, England) **Emotional problems of development in children.** London, England: Academic Press, 1974. x, 362 p. £5.

4858. Hersov, Lionel A. (Bethlem Royal & Maudsley Hosp, London, England) **Introduction: Risk and mastery in children from the point of view of genetic and constitutional factors and early life experience.** In E. J. Anthony & C. Koupernik (Eds), *The child in his family: Children at psychiatric risk: III*. New York, NY: John Wiley & Sons, 1974. xxi, 547 p.—It is suggested that "mastery" is one psychological process by which the organism adapts to limitations imposed by genetic and constitutional predispositions to inappropriate development or functioning. (34 ref)

4859. Hesselholdt, Sven & Aggerholm-Madsen, Gudrun. (Danish Coll for Educational Studies, Copenhagen) [Process and product in the marble-board test: The biosocial interaction and reading ability.] (Danh) *Skolepsykologi*, 1974, Vol 11(4), 277-303.—Investigated the relationship between reading ability, process and product on the marble-board test (MBT), social class, sex, and birth complications. Ss were 184 children (chronological age 10.5 yrs) selected from 8,820 born 1959-1961 at the National Hospital. The risk group was characterized by certain relatively mild pre- and perinatal complications with known or supposed relation to neuropsychiatric deviations (e.g., toxemia, premature birth, asphyxia); children of mothers with other known

significant symptoms during or related to pregnancy were excluded. Experimental and control groups were matched as to parents' social status, child's age and sex, and mother's chronological age. To measure process on the MBT, interrupted lines, number of corrections, and time were scored on 4 of the patterns. Results demonstrate a tendency to reading retardation in the risk group which was enhanced by low social class and inferior scores on the MBT, especially for boys. A distinction between minimal brain damage and early frustration could be drawn when the reading test and the MBT were compared. (19 ref)—*P. Mylov.*

4860. Hoffman, Richard J. (Miami U) **A Piagetian paradigm for interpreting and generating research dealing with conservation training.** *Journal of Experimental Education*, 1974(Fal), Vol 43(1), 47-52.—Presents empirical designs and statistical formulas for analyzing experiments dealing with the stability of conceptual knowledge over time, generalization, and the acquisition of more complex concepts, based on Piaget's theories. Research schemes are presented, and statistical considerations in using repeated measures, problems associated with kurtosis, and the assumption of homogeneity of variance are discussed.

4861. Hoyer, William J. (Syracuse U) **Aging as intraindividual change.** *Developmental Psychology*, 1974(Nov), Vol 10(6), 821-826.—Discusses experimental-manipulative research as a necessary means of establishing functional relationships between developmental change and its antecedents. The current focus of experimental-manipulative research in developmental psychology has been to account for age-associated interindividual differences by using within- and between-Ss methodologies. Consequently, the description, explanation, and modification of intraindividual stability, and change over time have received relatively little emphasis. It is suggested that small-N methodologies (e.g., single-S reversal designs), which represent the most parsimonious source of intraindividual data, circumvent certain methodological problems in developmental research and provide information that cannot be obtained from traditional within- and between-Ss designs. Statistical techniques for studying intraindividual variation and its antecedents over age (or time) are also discussed. (48 ref)—*Journal abstract.*

4862. Knafle, June D. (Eastern Connecticut State Coll) **Children's discrimination of rhyme.** *Journal of Speech & Hearing Research*, 1974(Sep), Vol 17(3), 367-372.—A consonant-vowel-consonant rhyming test, which had 2 slightly different types of auditory differentiation, was given to 273 kindergarten to 3rd-grade children. A related rhyming test was also given to 62 of the kindergarten children. Results show that the rhyming category which required differentiation at the ends of words was more difficult than the category which required differentiation within the words. Correct responses increased with successive grade levels, but category differences remained. Sex differences were not significant. The rhyming test which had initial consonant similarities of stimulus and nonrhyming response words was more difficult for the kindergarten children than the rhyming test which did not have such similarities.—*Journal abstract.*

4863. Kren, George M. & Rappoport, Leon. (Kansas State U) **Glio and psyche. History of Childhood Quarterly: The Journal of Psychohistory**, 1973(Sum), Vol 1(1), 151-163.—Reviews the relationships between history and psychology as converging sciences at the sociocultural and individual levels. Emphasis is placed on childhood as a psychohistorical phenomenon; the understanding of human development requires a knowledge of its historical context. (42 ref)

4864. Longstreth, Langdon E. (U Southern California) **Psychological development of the child.** (2nd ed). New York, NY: Ronald Press, 1974. x, 574 p. \$10.95.—Presents a summary of current knowledge in the field of child development, focusing on the issue of stimulus-response learning theory vs cognitive theory and what each can or cannot account for in the changes that characterize the child's psychological development.

4865. Maller, Owen & Desor, Jeanette A. (U Pennsylvania, Monell Chemical Senses Ctr) **Effect of taste on ingestion by human newborns.** In J. F. Bosma (Ed), *Oral sensation and perception: Development in the fetus and infant: Fourth symposium*. Washington, DC: US Government Printing Office, DHEW Pub No (NIH) 73-546, 1973. xix, 419 p. \$8.55.

4866. Milianti, Franklin J. & Cullinan, Walter L. (VA Hosp, Hines, IL) **Effects of age and word frequency on object recognition and naming in children.** *Journal of Speech & Hearing Research*, 1974(Sep), Vol 17(3), 373-385.—Visual duration threshold, matching-response latencies, and object-naming latencies were obtained for 30 9-yr-old and 15 6-yr-old normal-speaking male children. Stimuli were drawings of objects whose names represent a wide range of frequency of occurrence in the language according to the Thorndike-Lorge word count. The 9-yr-old Ss had significantly shorter visual-duration thresholds, matching-response latencies, and object-naming latencies than the 6-yr-olds. The latency for object naming was negatively and significantly correlated with the logarithm of frequency of occurrence of the names, but neither visual duration threshold nor latency for matching correlated significantly with frequency of occurrence. Results support the hypothesis that the major source of variance in object-naming latencies for common and rare words is not attributable to the perceptual identification of the objects.—*Journal abstract.*

4867. Mohanty, Gour S. (Ministry of Defence, Directorate of Psychological Research, New Delhi, India) **Analysis of response strategy and sensitivity dimension in the study of age-differences in recognition memory.** *Indian Journal of Psychometry & Education*, 1973(Dec), Vol 4(2), 59-66.—Compared 19-20 yr olds with 9-10 yr olds on expectancy and criterion placement in recognition memory tasks when the probability of signal presence is manipulated. Nonsignificant results suggest that the 2 age groups may differ in criterion placement, supporting the hypothesis that older groups are more cautious in decision-making and younger groups are more liable to take risks.—*J. B. Francis.*

4868. Mori, Ichio. **[The effect of high and low-speed motion pictures on children's spatio-temporal recognition.]** (Japn) *Japanese Journal of Educational Psychology*, 1973(Sep), Vol 21(3), 171-176.—Tested the

effect of speed perception on judgment of duration and distance. In Exp I, variable-speed motion pictures were shown to different groups of 92 5-yr-old and 87 11-yr-old children, and pre-post measures of perception of duration were compared. In Exp II, groups of the same children were exposed to synchronous and isochronous projections of the same film. Results indicate that younger children overestimated duration after they were exposed to slow-motion pictures, and underestimated it after fast-motion pictures, but older children were influenced only by fast movement. Younger children's concepts of time and distance depended much more on perception of movement than did those of older children. —S. Choe.

Bosma (Ed), *Oral sensation and perception: Development in the fetus and infant: Fourth symposium*. Washington, DC: US Government Printing Office, DHEW Pub No (NIH) 73-546, 1973. xix, 419 p. \$8.55.

4870. Palmer, Robert D. (VA Hosp, Brooklyn, NY) **Dimensions of differentiation in handedness.** *Journal of Clinical Psychology*, 1974(Oct), Vol 30(4), 545-552.—Expressions of handedness can be viewed as complex phenomena rooted in more general aspects of motor and psychological differentiation. The present study explored the dimensionality of a domain of behavioral measures of degree of differentiation in handedness of 60 male undergraduate Ss. Results challenge 2 widely held assumptions about the structure and measurement of handedness—that handedness is a unitary phenomenon and that it can be measured comprehensively by questionnaire. On the other hand, some generally held notions about the lesser differentiation of left-handers received substantive support. Findings have potential methodological and theoretical significance for developmentally oriented research on motor and cognitive development. (24 ref)—*Journal summary*.

4871. Regan, Carole. (St Joseph's Coll) **Approaches to research in child development.** In R. Hyatt & N. Rolnick (Eds), *Teaching the mentally handicapped child*. New York, NY: Behavioral Publications, 1974. vii, 337 p.

4873. Rosenblith, Judy F. (Brown U) **Relations between neonatal behaviors and those at eight months.** *Developmental Psychology*, 1974(Nov), Vol 10(6), 779-792.—To determine whether newborn behavioral assessments are related to those at 8 mo, a replication sample design was used with 4 samples ( $n = 400$  each for Samples 1, 2, and 3 and  $n = 350$  for Sample 4) of a nearly randomly chosen clinic population of newborns. Neonatal behavior was assessed by the Graham-Rosenblith Scales and 8-mo behavior by the Collaborative Project (Bayley) Examination. 8-mo data are available for 1,215 of 1,550 cases. In addition to analyses within replication samples, relations were examined separately for males and females, blacks and whites, and within each of 4 gestational age categories. Many relations

between scores on the Neonatal Examination and performance at 8 mo were significant. Most of those found for the total were found in Sample 1 (at the .20 level or better). Fewer relations between ratings and 8-mo performance were significant.—*Journal abstract*.

4874. Sameroff, Arnold J. (U Rochester) **Reflexive and operant aspects of sucking behavior in early infancy.** In J. F. Bosma (Ed), *Oral sensation and perception: Development in the fetus and infant: Fourth symposium*. Washington, DC: US Government Printing Office, DHEW Pub No (NIH) 73-546, 1973. xix, 419 p. \$8.55.

4875. Schaller, M. Joseph & Harris, Lauren J. (U Wisconsin, Madison) **Children judge "perspective" transformations of letterlike forms as different from prototypes.** *Journal of Experimental Child Psychology*, 1974(Oct), Vol 18(2), 226-241.—96 5-13 yr old children made same-different judgments of prototypes of letterlike forms paired with transforms of these prototypes generated on a dimension either critical or noncritical for object identification. For compression transformations (noncritical—as in perspective shift), frequency of correct "different" judgments increased as the degree of compression in the transform increased. This result challenges the view that dimensions irrelevant in object identification are ignored or not detected in graphic discrimination. (23 ref)—*Journal abstract*.

4876. Sigel, Irving E. (Educational Testing Service, Princeton, NJ) **When do we know what a child knows?** *Human Development*, 1974, Vol 17(3), 201-217.—Notes that assessing the individual's knowledge involves sampling in areas of the class of items and the class of responses. If an individual's knowledge base is sampled with decontextualized items, the response is a better indication of knowledge since it is not dependent on extra dimensional support (i.e., reflects generalization not tied to a particular context). However, if tasks demand similar processes but vary in form of presentation, the meaning and significance of form should be examined. The context in which the item is presented alters the very nature of that item by virtue of necessitated situational constraints or facilitators. Accordingly, the task is to define the context variables in order to discover what questions influence the expression of knowledge—why the child solves a problem in one context and not in another, how much of the context must be included in the evaluation, and what that context should be. The answers must come from 3 kinds of considerations: task-oriented criteria, motivational elements, and the relationship between personality and performance.—*Journal abstract*.

4877. Stark, Rachel E. & Nathanson, Susan N. (Johns Hopkins U, Medical School) **Spontaneous cry in the newborn infant: Sounds and facial gestures.** In J. F. Bosma (Ed), *Oral sensation and perception: Development in the fetus and infant: Fourth symposium*. Washington, DC: US Government Printing Office, DHEW Pub No (NIH) 73-546, 1973. xix, 419 p. \$8.55.

4878. Thornburg, Hershel D. (Ed.). (U Arizona) **Preadolescent development.** Tucson, AZ: University of Arizona Press, 1974. xii, 356 p.—Presents a collection of 27 papers on the psychological aspects of the preadolescent years. Topics discussed include physical growth, sex

differences, intelligence, values, discipline, drugs, sexuality, and life problems.

4879. Vondracek, Sarah I. & Kirchner, Elizabeth P. (Pennsylvania State U) **Vocational development in early childhood: An examination of young children's expressions of vocational aspirations.** *Journal of Vocational Behavior*, 1974(Oct), Vol 5(2), 251-260.—Investigated vocational aspirations in 282 3-6 yr old children. Age comparisons suggested that one aspect of vocational development in early childhood involves mastery of the task of projecting oneself into the future and conceiving of oneself as one day achieving adult status. Race comparisons indicated that urban blacks were less mature than urban whites in terms of mastery of the vocational projective task seen as characteristic of this developmental period. No significant sex differences were found in rate of development. However, there were indications that the pattern of vocational projection differs for males and females and that females undergo occupational foreclosure earlier than their male peers. (22 ref)—*Journal abstract*.

4880. Weiffenbach, James M. & Thach, Bradley T. (NIH, National Inst of Dental Research, Bethesda, MD) **Elicited tongue movements: Touch and taste in the mouth of the neonate.** In J. F. Bosma (Ed), *Oral sensation and perception: Development in the fetus and infant: Fourth symposium*. Washington, DC: US Government Printing Office, DHEW Pub No (NIH) 73-546, 1973. xix, 419 p. \$8.55.

4881. Whiteside, John A. (Clark U) **Eye movements of children, adults, and elderly persons during inspection of dot patterns.** *Journal of Experimental Child Psychology*, 1974(Oct), Vol 18(2), 313-332.—Recorded the eye movements of 20 4-62 yr old Ss, by a corneal reflection technique, during familiarization with and subsequent attempts at recognition of random patterns of 8 luminous dots located in a 44° square field. Young children tended to scan the entire display, but there was little similarity between their eye movement patterns and the stimuli. College students limited their fixations to a smaller area; nonetheless, there was greater similarity between their eye movement patterns and the stimuli. The fixations of the elderly Ss were spread over a larger area than those of the college students and bore a greater similarity to the stimuli than did the fixations of the young children. (21 ref)—*Journal abstract*.

4882. Winder, Alvin E. (Ed.). (U Massachusetts, School of Health Sciences, Amherst) **Adolescence: Contemporary studies.** (2nd ed). New York, NY: D. Van Nostrand, 1974. xvi, 427 p.—Presents a collection of 27 articles on various aspects of adolescence, including normal growth and development, behavioral expectations of adolescence (e.g., drug use, sexuality, and music), and life decisions (e.g., family relationships, school, and work and life styles).

### Cognitive & Physical Development

4883. Berch, Daniel B. & Israel, Michael. (U New Mexico) **The effects of setting similarity on children's learning of the transverse patterning problem.** *Journal of Experimental Child Psychology*, 1974(Oct), Vol 18(2), 252-258.—Gave 15 4th graders training on the transverse patterning problem, a task consisting of 3 different

geometric forms presented in pairs. 3 other groups of 15 4th graders each received training on problems containing the same geometric forms, along with either 1 (color or size) or 2 (color and size) additional nonspatial dimensions varying among the settings comprising the different cue-cue patterns. None of the Ss solved the basic transverse patterning problem, nor was there any improvement in performance on this problem after 90 trials. The addition of 1 nonspatial dimension resulted in solution, and the greater the number of nonspatial dimensions present, the better the learning.—*Journal abstract*.

4884. Bergman, Lars R. **Parents' education and mean change in intelligence.** *Reports from the Psychological Laboratories, University of Stockholm*, 1972(May), No 350, 17 p.—For 815 Swedish school children aged 9 yrs in 1965, mean changes between 9 and 12 yrs were studied for Verbal Comprehension, Inductive Ability, Spatial Ability, and General Intelligence. Controlling for initial values, moderate differences in estimated mean change were found between groups having different parents' education. These differences were largest for males and were in Verbal Comprehension. Properties of the sample and population are discussed. A comparison with other Swedish samples suggests that the present sample may be reasonably representative of many Swedish urban populations with regard to the problem under study. (22 ref)—*Journal abstract*.

4885. Biller, Henry B. (U Rhode Island) **Paternal deprivation, cognitive functioning and the feminized classroom.** In A. Davids, *Child personality and psychopathology: Current topics: I*. New York, NY: John Wiley & Sons, 1974. ix, 239 p. \$13.95.

4886. Bloom, Lois. (Teachers Coll, Columbia U) **Talking, understanding, and thinking.** In R. L. Schiefelbusch & L. L. Lloyd (Eds), *Language perspectives: Acquisition, retardation, and intervention*. Baltimore, MD: University Park Press, 1974. xv, 670 p. \$14.50.—Explores 2 hypotheses on the development of understanding and speech: (a) that both depend on the same underlying information (or competence) but each manifests a different performance mode and (b) that the 2 represent mutually dependent but different underlying processes with shifting influences between them in the course of language development. (2½ p ref)

4887. Bowerman, Melissa F. (U Kansas, Bureau of Child Research) **Discussion summary: Development of concepts underlying language.** In R. L. Schiefelbusch & L. L. Lloyd (Eds), *Language perspectives: Acquisition, retardation, and intervention*. Baltimore, MD: University Park Press, 1974. xv, 670 p. \$14.50.—Critically reviews articles by E. V. Clark, et al (see PA, Vol 53:Issue 3) on language acquisition. 5 major themes prominent in recent literature on the relationship between linguistic and cognitive development are discussed: (a) language as a manifestation of the symbolic function, (b) formal similarities between cognitive and linguistic structures and processes, (c) strategies for language acquisition derived from the child's cognitive structuring of the world, (d) functional concepts and categories underlying early multiword utterances, and (e) representation of children's knowledge of linguistic structure. (33 ref)

4888. Brainerd, Charles J. (U Alberta, Edmonton, Canada) **The age-stage issue in conservation acquisition.** *Psychonomic Science*, 1972(Oct), Vol 29(2), 115-117. —Examined whether experimentally induced conservation acquisition is a function of chronological age, developmental stage, or both. 88 nonconserving kindergarten Ss (mean age = 5 yrs, 7 mo) were assigned randomly to 2 training conditions and 2 control conditions. Ss in the 2 training conditions were trained on number conservation via a simple reinforcement procedure and were posttested 1 wk after training. An initial correlational analysis indicated that both age and stage predicted posttest performance; however, a subsequent partial correlational analysis revealed that stage was the only reliable predictor of posttest performance. Findings suggest that the benefit derived from training experiences by a nonconserving S depends on the S's pretraining stage but not on the S's age.—*Journal abstract.*

4889. Brannigan, Gary G.; Duchnowski, Albert J. & Nyce, Peggy A. (State University Coll New York, Plattsburgh) **Roles of approval motivation and social reinforcement in children's discrimination learning.** *Developmental Psychology*, 1974(Nov), Vol 10(6), 843-846.—144 3rd- and 4th-grade children were given a 2-choice discrimination learning task. The 2 major factors were (a) the 3 levels of social desirability (high, moderate, and low) on the Children's Social Desirability scale; and (b) the 2 types of treatment conditions (monetary-social reinforcement and monetary-no social reinforcement). In opposition to D. P. Crowne and D. Marlowe's (1961) model of the approval-motivated individual, the high-social-desirability group made significantly fewer errors than both the moderate and low groups. It is suggested that for young children, social desirability scores may require a different interpretation than scores for older children and adults. (17 ref) —*Journal abstract.*

4890. Bricker, William A. & Bricker, Diane D. (George Peabody Coll for Teachers, John F Kennedy Ctr for Research on Education & Human Development) **An early language training strategy.** In R. L. Schiefelbusch & L. L. Lloyd (Eds), *Language perspectives: Acquisition, retardation, and intervention*. Baltimore, MD: University Park Press, 1974. xv, 670p \$14.50. —Presents a strategy integrating operant, linguistic, cognitive, and psycholinguistic approaches to language acquisition and language training for children with delayed language development. (6½ p ref)

4891. Butterfield, Earl C. & Cairns, George F. (U Kansas, Medical Ctr, Ralph L. Smith Mental Retardation Research Ctr) **Discussion summary: Infant reception research.** In R. L. Schiefelbusch & L. L. Lloyd (Eds), *Language perspectives: Acquisition, retardation, and intervention*. Baltimore, MD: University Park Press, 1974. xv, 670p \$14.50. —Critically reviews articles by P. A. Morse (see PA, Vol 53:Issue 3) and P. D. Eimas (see PA, Vol 53:Issue 3) concerning use of high amplitude suck procedure and voice onset time to study infants' auditory reception. The need for infant experiments designed to assess the impact of environmental interventions on their perception is noted.

4892. Chapman, Robin S. (U Wisconsin, Madison) **Discussion summary: Developmental relationship between receptive and expressive language.** In R. L. Schiefelbusch & L. L. Lloyd (Eds), *Language perspectives: Acquisition, retardation, and intervention*. Baltimore, MD: University Park Press, 1974. xv, 670p \$14.50. —Critically reviews articles by L. Bloom (see PA, Vol 53:Issue 3) and D. Ingram (see PA, Vol 53:Issue 3) on the developmental relationship between receptive and expressive language.

4893. Chong-Jen, Chuang. (National Taiwan U, Taipei, Republic of China) **[The factors of grade and school achievement in concept formation of children.]** (Chin) *Acta Psychologica Taiwanica*, 1973, Vol 15, 54-58. —To clarify the development of conceptual ability and its relationship to school achievement, the concepts of direction, number, and movement were tested. It was found that the development of conceptual ability was continuous for children in Grades 1-5, and was significantly related to school achievement.

4894. Clark, Eve V. & Garnica, Olga K. (Stanford U, Committee on Linguistics) **Is he coming or going? On the acquisition of deictic verbs.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Oct), Vol 13(5), 559-572. —Examined the acquisition of deictic verbs by asking each of 44 children (5 yrs 6 mo to 9 yrs 5 mo old) to identify the speaker or the addressee of utterances containing *come*, *go*, *bring*, and *take*. Results showed that the youngest Ss appeared to understand *come* and *bring* but not *go* and *take*. Analysis of the strategies used showed that children go through several stages: (a) they identify both speaker and addressee with the goal of the motion; (b) they identify only the addressee with the goal; (c) they identify the addressee of *go* with the goal, but are otherwise correct; (d) they give adult-like responses. Data provide further evidence that strategies play an important role in the acquisition of word meanings. (17 ref)—*Journal abstract.*

4895. Clark, Eve V. (Stanford U, Committee on Linguistics) **Some aspects of the conceptual basis for first language acquisition.** In R. L. Schiefelbusch & L. L. Lloyd (Eds), *Language perspectives: Acquisition, retardation, and intervention*. Baltimore, MD: University Park Press, 1974. xv, 670p \$14.50. —Examines the relation between cognitive-perceptual factors and the acquisition of word meanings. Data on perception of movement, size, sound, taste, texture, and shape are reviewed and hypothesis-and-strategy approaches of children discussed. (3½ p ref)

4896. de Armengol, Mercy; Goldstein, Frida & Lombana, Inés. (U de los Andes, Bogotá, Colombia) **[Comparison of imitation, comprehension and the production of grammatical contrasts by children from high and low socioeconomic classes.]** (Span) *Revista Latinoamericana de Psicología*, 1974, Vol 6(2), 239-254. —Administered a Spanish adaptation of the Imitation, Comprehension and Production Test to 48 children 38-50 mo old in kindergartens in Bogotá, Colombia. Ss were divided in 2 equal groups according to socioeconomic class. Results show statistically significant differences in the performance of the groups, in favor of the high socioeconomic class. In both groups imitation was significantly better than comprehension and production,

and comprehension was better than production. (22 ref)—A. V. Colotla.

4897. Eimas, Peter D. (Brown U) **Linguistic processing of speech by young infants.** In R. L. Schiefelbusch & L. L. Lloyd (Eds), *Language perspectives: Acquisition, retardation, and intervention*. Baltimore, MD: University Park Press, 1974. xv, 670 p \$14.50.—Presents a feature detector model of speech perception and discusses its advantages and disadvantages. Problems of interpreting the data are examined. The need to describe the higher order invariances and to establish the existence of phonetic feature detector systems for the remaining phonetic features is noted. (3 p ref)

4898. Engemann, Alwin. (U Tübingen, Psychological Inst, W Germany) **[On strategies in problem solving behavior of children at various intelligence levels.]** (Germ) *Zeitschrift für Experimentelle und Angewandte Psychologie*, 1974, Vol 21(1), 39-61.—Presented periodic sequences of geometric symbols to test the strategies of 60 9-11 yr old children when predicting the next symbol in the series. Half of the Ss tested above and half below the mean of a group intelligence test. The group with higher scores on the intelligence test employed significantly more often a strategy based on examination of the shortest periodic sequence detected so far, independently of success or failure of previous predictions. The group with lower scores on the intelligence test was more influenced by successes on previous predictions while developing new hypotheses. (English & French summaries) (36 ref)—W. J. Koppitz.

4899. Entwisle, Doris R. & Frasure, Nancy E. (Johns Hopkins U) **A contradiction resolved: Children's processing of syntactic cues.** *Developmental Psychology*, 1974(Nov), Vol 10(6), 852-857.—Using 6-9 yr old children, an attempt was made to replicate D. McNeill's (1970) investigation, which suggested that although semantic cues aided processing of sentences by 5-8 yr olds, syntactic cues did not. In agreement with other more recent studies, results show that children's ability to process syntactically well-formed sentences increased over the early school years. The difference between McNeill's data and later data sets probably stems from (a) unreliability owing to small samples (5 children) at each age level and (b) unreliability due to the high difficulty of sentences used for the criterion.—*Journal abstract*.

4900. Fein, Greta G. & Eshleman, Suzann. (Yale U) **Individuals and dimensions in children's judgment of same and different.** *Developmental Psychology*, 1974(Nov), Vol 10(6), 793-796.—Used the 2-choice transposition problem to examine children's judgments of "same" and "different." When instructed to choose "the same" object in the test phase, kindergartners ( $n = 24$ ) chose the same dimensional value whereas 3rd graders ( $n = 24$ ) chose the specific stimulus which had been positive during training. When instructed to choose "the different" or "a different" object, both groups chose on the basis of individual identity. Ontogenetic changes in children's use of individual identities and dimensional values, and the relation between linguistic and cognitive factors, are discussed.—*Journal abstract*.

4901. Friedman, Steven; Bruno, Lois A. & Vietze, Peter. (George Peabody Coll) **Newborn habituation to**

**visual stimuli: A sex difference in novelty detection.** *Journal of Experimental Child Psychology*, 1974(Oct), Vol 18(2), 242-251.—Repeatedly exposed 18 male and 18 female newborn human infants to 1 of 2 visual stimuli, a 4-square or 144-square black and white checkerboard target, until a set criterion of habituation was demonstrated, as measured by a decrement in visual fixation time. When the habituation criterion was reached, independent groups of Ss were either presented with the same target or with a target of either moderate or large discrepancy from the standard habituation stimulus. Results indicate that (a) there was habituation of visual attention, which suggests that some infants are capable of storing simple visual information soon after birth, and (b) following habituation female infants displayed greater recovery of attention than male infants when the moderate stimulus change was introduced. (23 ref)—*Journal abstract*.

4902. Garb, Jane L. & Stunkard, Albert J. **Taste aversions in man.** *American Journal of Psychiatry*, 1974(Nov), Vol 131(11), 1204-1207.—A questionnaire survey of 696 Ss in 6 different age groups, early childhood to old age, revealed that taste aversions may be acquired by a special kind of learning that has previously been demonstrated clearly only in animals. Gastrointestinal illness was associated with acquisition of aversions in 87% of the Ss. One pairing of food and illness was sufficient to produce aversions that lasted for many years. Onset of aversions was most common between ages 6 and 12, when the prevalence rate reached 30%; it then fell steadily to a low of 6% after age 60. A better understanding of taste aversions may help improve conditioned aversion procedures in the treatment of alcoholism and obesity. (21 ref)—*Journal abstract*.

4903. Gladstone, Roy & Palazzo, Richard. (Oklahoma State U of Agriculture & Applied Science) **Empirical evidence for reversibility by inversion.** *Developmental Psychology*, 1974(Nov), Vol 10(6), 942-948.—The State U nonconservers to give correct reversal judgments of height and amount (volume) was tested with the water conservation problem. Ss were 72 children, 24 from each of the following age groups: 3-yr-olds, 4-yr-olds, and 5-yr-olds. Each child answered each question 8 times (8 trials). Results show that the ability to give correct height- and amount-reversal judgments increased with trials, and correct height judgments increased with age. The Genevan school explains such results by positing a capacity for empirical reversibility in nonconservers in contrast to a capacity for logical reversibility in conservers. It is maintained that the data from this task do not justify the postulation of 2 different kinds of reversal capacities.—*Journal abstract*.

4904. Hale, Gordon A. & Piper, Richard A. (Educational Testing Service, Princeton, NJ) **Effect of pictorial integration on children's incidental learning.** *Developmental Psychology*, 1974(Nov), Vol 10(6), 847-851.—Conducted 2 experiments to examine 192 8-, 11-, and 14-yr-old children's incidental learning with the central and incidental pictorial elements in each stimulus (a) presented as separate entities (standard condition), (b) depicted together in an action relation (2 types—weak action and strong action), or (c) depicted together in a

static relation. Following a learning task in which attention to a single element in each stimulus was required, incidental learning was measured by having the S indicate the incidental feature associated with each central component. Results show that incidental learning was higher with the action than the standard materials, but the developmental trend in these scores was little affected by pictorial integration. While extending the generality of previous incidental learning results, these data contrast with evidence showing an increase with age in the effects of action portrayal on intentional learning of pictorial associations.—*Journal abstract.*

4905. Hale, Gordon A. & Stevenson, Edward E. (Educational Testing Service, Princeton, NJ) **The effects of auditory and visual distractors on children's performance in a short-term memory task.** *Journal of Experimental Child Psychology*, 1974(Oct), Vol 18(2), 280-292.—Assessed 144 5- and 8-yr-old children's performance in a short-term memory task under 2 auditory and 2 visual distraction conditions, as well as with no extraneous stimuli present. Performance under distraction was inferior to that under nondistraction, but the degree of difference was roughly the same at ages 5 and 8, indicating little developmental change in the effects of distraction over this age range. Other findings included differences in the effectiveness of the distractors used and evidence that the Ss adapted somewhat to the influence of extraneous stimulation. (16 ref)—*Journal abstract.*

4906. Hall, James W. (Northwestern U, School of Education) **Experimentally acquired associations in memory encoding by preschoolers.** *Psychonomic Science*, 1972(Oct), Vol 29(2), 113-114.—25 preschool children (mean age = 3 yrs, 7 mo) were given extensive paired-associate (PA) training in which response terms were highly familiar words and stimulus terms were words semantically related to response terms but relatively unfamiliar to the Ss. Subsequent recognition memory (RM) performance indicated, by an analysis of false recognitions, that the newly acquired associations functioned during the encoding of the RM items (i.e., the PA response terms occurred as implicit associative responses to the PA stimulus terms presented for learning). The feasibility of using an entirely verbal PA task with children as young as 3 yrs also was demonstrated.—*Journal abstract.*

4907. Hallahan, Daniel P.; Kauffman, James M. & Ball, Donald W. (U Virginia) **Effects of stimulus attenuation on selective attention performance of children.** *Journal of Genetic Psychology*, 1974(Sep), Vol 125(1), 71-77.—Studied 108 children in Grades 1, 5, and 7 to determine whether (a) attenuation of irrelevant information on a selective attention task would result in increased selective attention and (b) a developmental increase in selective attention would be replicated with the use of a different procedure of data analysis than has been used previously. Results do not indicate that stimulus attenuation had any effects. This result is discussed in terms of its relevance to fading techniques in discrimination training studies. There was a developmental increase in selective attention which was most pronounced from the 5th- to the 7th-grade Ss. (19 ref)—*Journal abstract.*

4908. Hamel, B. R. (Free U Amsterdam, Netherlands) **Children from 5 to 7: Some aspects of the number concept.** Rotterdam, Netherlands: Rotterdam University Press, 1974. ix, 91 p.—Reports 6 experiments on the development of the Piagetian number concept and the transition from nonconservation to conservation of quantity in young children. Issues involved in the validity of training experiments and longitudinal research on concept acquisition are also examined. (3½ p ref)

4909. Hammer, Madeline & Turkewitz, Gerald. (Graduate School & University Ctr, City U New York) **A sensory basis for the lateral difference in the newborn infant's response to somesthetic stimulation.** *Journal of Experimental Child Psychology*, 1974(Oct), Vol 18(2), 304-312.—Examined 27 female newborn infants' cardiac response to stimulation of the left and right perioral region. Cardiac acceleration occurred significantly more frequently to stimulation of the right than to stimulation of the left. Ipsilateral head turning also occurred more reliably to stimulation of the infant's right side than to stimulation of his left side. Evidence of reliable lateral differences in cardiac acceleration responses even under conditions in which the effects of lateral differences in head turning were removed suggest that laterally differentiated cardiac responsiveness is not merely a function of increased motor activity consequent upon stimulation of the infant's right side, but also reflects a difference in sensitivity at the infant's 2 sides as well. (17 ref)—*Journal abstract.*

4910. Hass, Wilbur A. & Wepman, Joseph M. (Shimer Coll) **Dimensions of individual difference in the spoken syntax of school children.** *Journal of Speech & Hearing Research*, 1974(Sep), Vol 17(3), 455-469.—Language produced by 180 5-13 yr olds on a story-telling task was analyzed in terms of 57 variables. Factor analysis revealed 5 dimensions of syntactic usage: general fluency, embeddedness, finite verb structure, noun phrase structure, and qualified speech. The embeddedness dimension was the only one with a sizable relation to age. (38 ref)

4911. Hollos, Marida. **Growing up in Flathill: Social environment and cognitive development.** Oslo, Norway: Universitetsforlaget, 1974. 166 p.—Presents a comparative study of social roles and environmental factors in intellectual development based on tests conducted with 3 groups of Norwegian children from 3 different social milieus. One of these groups, the children from Flathill, an isolated Norwegian farm community, is discussed in detail based on the author's own experiences with them. (3½ p ref)

4912. Hoving, Kenneth L.; Morin, Robert E. & Konick, Dorothy S. (Kent State U) **Age related changes in the effectiveness of name and visual codes in recognition memory.** *Journal of Experimental Child Psychology*, 1974(Oct), Vol 18(2), 349-361.—In the 1st of 3 studies 48 college, 3rd-grade, and kindergarten Ss were able to determine that 2 stimuli presented 700 msec apart were the same more quickly if they were visually identical than if they shared the same name. If 3,000 msec elapsed between stimulus presentations, 3rd graders and college Ss responded at the same rate in making both types of matches, whereas kindergarten Ss continued to respond

more quickly in making visual matches. In Study 2, a warning signal, presented 500 msec prior to the 2nd stimulus, reduced reaction times (RT) at both interstimulus intervals, but no significant differences in making visual and name matches occurred. In Study 3 32 1st-graders, responding either with or without a warning signal, responded like the older Ss in Study 1. The warning signal again reduced RT at both intervals. —*Journal abstract.*

4913. Ingram, David. (U British Columbia, Vancouver, Canada) **The relationship between comprehension and production.** In R. L. Schiefelbusch & L. L. Lloyd (Eds), *Language perspectives: Acquisition, retardation, and intervention*. Baltimore, MD: University Park Press, 1974. xv, 670 p \$14.50.—Proposes that comprehension precedes production as a linguistic universal of acquisition. It is suggested that confusion on this point has resulted from lack of definition of terms and that current research supports rather than contradicts this view. (2 p ref)

4914. Jensen, Arthur R. (U California, Inst of Human Learning, Berkeley) **Cumulative deficit: A testable hypothesis?** *Developmental Psychology*, 1974(Nov), Vol 10(6), 996-1019.—Discusses theoretical issues and the methodological problems involved in establishing the progressive decrement phenomenon in relation to the relevant research on disadvantaged groups, especially American blacks. In this group in particular there is no methodologically adequate evidence in the literature for a progressive decrement in IQ or other mental measurements. The present study with over 8,000 black and white elementary school children used differences between younger and older siblings, which satisfies more rigorous methodological requirements for the detection of progressive decrement than have existed in previous studies. A significant age decrement was found in Lorge-Thorndike Verbal IQ but not in Nonverbal IQ among blacks, although the mean white-black difference was similar for Nonverbal and Verbal IQ. (31 ref)—*Journal abstract.*

4915. Kajita, Masami & Nakano, Yasuhito. [Study of the development of performance and learning type in paired-associate learning.] (Japn) *Japanese Journal of Educational Psychology*, 1973(Sep), Vol 21(3), 160-170.—Administered 2 independent paired-associate learning tasks to 83 5-11 yr old children. Task 1 consisted of 6 stimulus pictures and 3 response colors, and Task 2 consisted of 9 pictures and 4 colors. Ss who did not reach learning criterion after 15 trials in Task 1 were eliminated for Task 2. E observed the learning types of each performance, and classified into 2 categories: S-R and E-R. Results indicate that older children used the rules of inclusion and exclusion more efficiently, and therefore reached the learning criterion faster than younger children ( $p < .01$ ). (English summary)—S. Choe.

4916. Kastenbaum, Robert. (U Massachusetts, Boston) **Childhood: The kingdom where creatures die.** *Journal of Clinical Child Psychology*, 1974(Sum), Vol 3(2), 11-14.—Challenges the view still held by most adults that children are innocent of the concepts of death. This view is maintained because it protects adults, not children. Much of children's play and conversation is death-oriented. Children may be aware of death as early as age

2 and may go through several stages of conceptualization. It is concluded that children never live in a world apart from death but "are engaged in making a series of discoveries that adults might count themselves privileged to shares." (16 ref)—A. Krichev.

4917. Kern, Stephen. (Northern Illinois U) **Freud and the discovery of child sexuality.** *History of Childhood Quarterly: The Journal of Psychohistory*, 1973(Sum), Vol 1(1), 117-141.—Disputes Freud's claim of being the first to recognize the regular existence of normal sexual feelings in childhood, arguing that every stage of psychosexual development had been recognized before Freud. His contribution was to integrate this information. (75 ref)

4918. Koocher, Gerald P. (Children's Hosp Medical Ctr, Developmental Evaluation Clinic, Boston, MA) **Conversations with children about death: Ethical considerations in research.** *Journal of Clinical Child Psychology*, 1974(Sum), Vol 3(2), 19-21.—Discusses some special problems which must be dealt with when researching children's reactions to death and dying. It is suggested that proper planning eliminates most potential problems and that talking about death is less painful than not talking about it. It is concluded that such research is necessary and beneficial.

4919. Kroes, William H. (US Public Health Service, Cincinnati, OH) **Concept shift and the development of the concept of class in children.** *Journal of Genetic Psychology*, 1974(Sep), Vol 125(1), 119-125.—A total of 60 kindergarten and 1st- and 2nd-grade girls were presented with 3 tasks: concept-shift, sort, and hierarchization. To check for reliability of performance, Ss were given a retest from 5 to 10 days after the 1st session, with the use of the same tasks but with slightly altered stimuli. Performance on all 3 tasks for both sessions was quite consistent; an invariance of order in task performance was found from sort to concept-shift to hierarchization. Without exception, Ss who failed a task also failed the higher-order task(s); and passing a task meant passing the lower-order task(s). Implications in relation to Piaget's theory of development of classificatory skills are given.—*Journal abstract.*

4920. Liberman, Isabelle Y.; Shankweiler, Donald; Fischer, F. William & Carter, Bonnie. (U Connecticut, School of Education) **Explicit syllable and phoneme segmentation in the young child.** *Journal of Experimental Child Psychology*, 1974(Oct), Vol 18(2), 201-212.—Suggests that phoneme segmentation is particularly difficult and more difficult than syllable segmentation. Direct evidence of a developmental ordering of syllable and phoneme segmentation abilities in the young child is presented. Using a task which required 135 preschool, kindergarten, and 1st-grade children to tap out the number of segments in spoken utterances, it was found that, though ability in both syllable and phoneme segmentation increased with grade level, analysis into phonemes was significantly harder and perfected later than analysis into syllables. The relative difficulties of the different units of segmentation are discussed in relation to reading acquisition. (25 ref)—*Journal abstract.*

4921. Maurer, Adah. **Intimations of mortality.** *Journal of Clinical Child Psychology*, 1974(Sum), Vol 3(2), 14-17.

—Reports a conversation with nursery school mothers about their children and the concept of death.

4922. McCall, Robert B.; Appelbaum, Mark I. & Hogarty, Pamela S. **Developmental changes in mental performance.** *Monographs of the Society for Research in Child Development*, 1973, Vol 38(3, Serial No 150), 83 p. —Investigated patterns of IQ change, using data from the Fels Longitudinal Study. According to that study, normal middle-class children changed an average of 28.5 IQ points between 2½ and 17 yrs of age, and 1 in 7 changed by more than 40 points. 80 Ss who had relatively complete IQ records (maximum of 17 tests) between 2½ and 17 yrs were clustered into 5 groups which represented different patterns of IQ change over age. These profiles were relatively simple linear or quadratic trends and not random fluctuations about a constant value. Major inflection points occurred at 6 and 10 yrs. It was not obvious that these patterns were simple products of repeated testing or of the changing nature of the IQ test. Ss in the 5 IQ profile clusters had parents who differed in the extent to which they attempted to accelerate their child's development and in the severity of punishments they administered. These parental correlates appeared to hold up even when parental education and IQ as well as the general level of the child's IQ were statistically controlled. Given the assumptions prompted by these data, the changing nature of environmental circumstances during the childhood years for a given individual may be as potent in changing IQ as the difference between family environments.—A. Barclay.

4923. Menyuk, Paula. (Boston U, School of Education) **Early development of receptive language: From babbling to words.** In R. L. Schiefelbusch & L. L. Lloyd (Eds), *Language perspectives: Acquisition, retardation, and intervention*. Baltimore, MD: University Park Press, 1974. xv, 670 p \$14.50. —Reviews studies of early perception and language production. Data on mother-child communication interactions are examined, and lines of research are suggested to acquire more complete data on the infant's perception of linguistic structural properties and his comprehension of the function of these properties. (41 ref)

4924. Millis, Willard E. & Witte, Kenneth L. (U Arkansas) **Mediation in young children's paired-associate learning.** *Bulletin of the Psychonomic Society*, 1974(Sep), Vol 4(3), 203-205.—Tested 4-, 6-, and 8-yr-old children ( $n = 12$  in each age group) with a forward chaining (A-B, B-C, A-C) mediation paradigm. Each list was comprised of 6 pictorial stimulus-response pairs. All associations were acquired in the laboratory via a study-test method involving a recognition task on the test trials. The lists were constructed such that positive transfer was expected for 2 stimulus-response pairs on the 3rd list (mediated facilitation), negative transfer was expected for 2 other pairs (mediated interference), and neither positive nor negative transfer was expected for the remaining 2 pairs (control). Analyses of correct responses during List III indicated (a) positive, but not negative, transfer; and (b) no age differences in positive transfer. (15 ref)—*Journal abstract*.

4925. Morehead, Donald M. & Morehead, Ann. (California State U, Hayward) **From signal to sign: A**

**Piagetian view of thought and language during the first two years.** In R. L. Schiefelbusch & L. L. Lloyd (Eds), *Language perspectives: Acquisition, retardation, and intervention*. Baltimore, MD: University Park Press, 1974. xv, 670 p \$14.50. —Provides a structural view of thought and language during the 1st 2 yrs. Piaget's genetic theory is presented and compared to some aspects of N. Chomsky's general theory of language. Piaget's theory of cognitive development is also described, and recent studies which consider linguistic development prior to and including the onset of syntax are discussed within a Piagetian framework. (3 p ref)

4926. Morse, Philip A. (U Wisconsin, Madison) **Infant speech perception: A preliminary model and review of the literature.** In R. L. Schiefelbusch & L. L. Lloyd (Eds), *Language perspectives: Acquisition, retardation, and intervention*. Baltimore, MD: University Park Press, 1974. xv, 670 p \$14.50. —Presents a model suggesting that current data can be better understood and future research more intelligently guided if the development of both linguistic and microgenetic coding in the infant is considered. (6 p ref)

4927. Nelson, Katherine. (Yale U) **Structure and strategy in learning to talk.** *Monographs of the Society for Research in Child Development*, 1973, Vol 38(1-2, Serial No 149), 136 p.—Reports the results of a longitudinal study of the acquisition of 1st words by 18 children 1-2 yrs old and discusses them in terms of an interaction model of the language-learning process. The 1st 50 words acquired by each S were analyzed in terms of grammatical form, content, and semantic structure. In general, the Ss began by naming objects exhibiting salient properties of change whether as the result of the child's own action (e.g., ball) or independent of it (e.g., car). They learned words of all major grammatical form classes and tended to differentiate small concept domains—e.g., food words or animals—from the beginning. An interaction model that interrelates the child's preverbal concepts, his acquisition strategies, and parental-acceptance patterns is presented as a framework for understanding these findings. Acquisition histories of individual Ss illustrate the way in which these factors interact.—A. Barclay.

4928. Nigl, Alfred J. & Fishbein, Harold D. (U Cincinnati) **Perception and conception in coordination of perspectives.** *Developmental Psychology*, 1974(Nov), Vol 10(6), 858-866.—Conducted 3 experiments, in an attempt to empirically describe the relative development of perceptual and conceptual understanding of projective relationships between objects and to explain a heuristic model of the cognitive processes involved in coordination of perspective tasks. Ss were a total of 330 4-12 yr olds. The results of Exps I and II indicate that the ability to relate perceptually and conceptually left-right and back-front relationships simultaneously emerged between the ages of 4½ and 5½ yrs, but by age 5½ perception was more advanced than conception. On tasks emphasizing perceptual understanding, performance approached asymptote at about age 9, but for tasks emphasizing conceptual understanding, performance was well below asymptote at age 12. In addition, on the latter tasks, the greatest performance increases occurred between the ages of 9 and 11, suggesting that a developmental shift occurs during that age range. The

results of all experiments are consistent with a model which identifies "extraction" of spatial relationships from the stimulus array and from the choice stimuli and "comparison" and "matching" of the images derived from extraction as the fundamental processes involved in both the perceptual and conceptual aspects of coordination of perspectives. (21 ref)—*Journal abstract.*

4929. Palermo, David S. (Pennsylvania State U, Lab for the Study of the Symbolic Processes) **Still more about the comprehension of "less."** *Developmental Psychology*, 1974(Nov), Vol 10(6), 827-829.—32 3-4 yr old children were asked to indicate "Which one has less?" in 4 different contexts. Results indicate that performance was the same in all contexts indicating that "more" is acquired before "less" and that those children who do not know "less" treat it as a synonym of "more." Differing results of previous studies cannot be attributed to the type of materials to which the comparative judgments are applied.—*Journal abstract.*

4930. Piaget, Jean. **The origins of intelligence in children.** (Trans M. Cook). New York, NY: International Universities Press, 1952. xi, 419 p.—Presents an analysis of the biological, sensorimotor, and cognitive aspects of the development of intelligence in children. Topics include the functional invariants and biological organization of intelligence, elementary sensorimotor adaptations (e.g., use of reflexes), and sensorimotor and practical intelligence and the theories of intelligence (e.g., the theories of grouping, assimilation, and association).

4931. Pollio, Marilyn R. & Pollio, Howard R. (U Tennessee) **The development of figurative language in children.** *Journal of Psycholinguistic Research*, 1974(Jul), Vol 3(3), 185-201.—174 children in Grades 3, 4, and 5 were asked to complete 3 tasks in an attempt to determine their ability to use figurative language. Results for a "composition" task show that children produced a greater number of frozen than novel figures and that the absolute level of such usage decreased over grades. A "multiple sentences" task reveals that children produced more frozen than novel figures and that both showed a marked increase over grade. A "comparisons" task indicates that figurative language increased over grade, and that for this task children used more novel than frozen figures. Taken in conjunction with earlier work, these data suggest that children are able to use figurative language well before they can explain the exact nature of the relationship linking elements of the figure. In Piagetian terms, this implies that children use figurative language in the stage of concrete operations but cannot explain such usage until the stage of formal operations.—*Journal abstract.*

4932. Roberts, Jean & Engel, Arnold. (US DHEW, Health Resources Administration, Div of Health Examination Statistics, Rockville, MD) **Family background, early development, and intelligence of children 6-11 years: United States.** *Vital & Health Statistics, Series 11*, 1974(Aug), No 142, 42 p.—Presents national estimates of the prevalence of selected congenital or other early developmental health problems and describes the relationship of selected aspects of family background, infant health status, and early developmental history to the intellectual development and maturity of noninstitution-

alized 6-11 yr olds in the US, based on findings from the national Health Examination Survey of 1963-1965. A probability sample of 7,119 children were studied. Measures of intellectual development were the short form of the WISC (Block Design and Vocabulary) and the modified Goodenough-Harris Human Figure Drawing tests (HFD). Among other findings, data show that the relationship between intellectual development and academic achievement of the mother was as strong as that previously found for this group with the educational level of the father and that the IQ of children on both measures decreased consistently as the number of other live children in the family increased. (73 ref)—*Journal summary.*

4933. Schiefelbusch, R. L. & Lloyd, L. L. (Eds.). (U Kansas, Bureau of Child Research) **Language perspectives: Acquisition, retardation, and intervention.** Baltimore, MD: University Park Press, 1974. xv, 670 p. \$14.50.

4934. Schlesinger, I. M. (Hebrew U Jerusalem, Israel) **Relational concepts underlying language.** In R. L. Schiefelbusch & L. L. Lloyd (Eds.), *Language perspectives: Acquisition, retardation, and intervention.* Baltimore, MD: University Park Press, 1974. xv, 670 p. \$14.50.—Discusses methodological issues in the investigation of relational concepts underlying children's language, focusing on the relation between linguistic and cognitive development. A careful examination of their interaction is expected to lead to a better understanding of child development. (32 ref)

4935. Siegel, Linda S. (McMaster U, Hamilton, Ontario, Canada) **Development of number concepts: Ordering and correspondence operations and the role of length cues.** *Developmental Psychology*, 1974(Nov), Vol 10(6), 907-912.—The development of ordering and correspondence operations, under varying degrees of the presence of length cues to number, was studied in 91 preschool children aged 3-5 yrs. Results show that ordering operations, as measured by a relative magnitude task, preceded the development of correspondence concepts. Many-to-one correspondence did not clearly develop before one-to-one correspondence. When length was positively correlated with number, performance improved on tasks involving judgments of comparative size, but did not improve where judgments of equality were required. When length and number cues were negatively correlated, performance was significantly retarded. The findings are interpreted in terms of the young child's difficulty in separating and coordinating the dimensions of length and number.—*Journal abstract.*

4936. Smiley, Ellen E. (City Coll, City U New York) **The acquisition of behavioral chains.** *Journal of Experimental Child Psychology*, 1974(Oct), Vol 18(2), 190-200.—Conducted 3 experiments with a total of 38 4-yr-old children to study some conditions which facilitate the acquisition of behavioral chains in the context of marking and naming tasks. In Exp I Ss were required to respond overtly to the internal components of the chain. In Exp II an aversive contingency was imposed following errors. In Exp III instructions were added at the beginning of training. Results show that (a) requiring Ss to mark and name the correct stimuli on each trial increased the accuracy of performance, (b) introducing

time-out contingent on incorrect responses depressed the error rate, and (c) adding instructions concerning a pending change in the experimental task resulted in a lower error rate following withdrawal of the instructional stimuli. (24 ref)—*Journal abstract*.

4937. Spradlin, Joseph E. (U Kansas, Bureau of Child Research) **Discussion summary: Development of receptive language.** In R. L. Schiefelbusch & L. L. Lloyd (Eds), *Language perspectives: Acquisition, retardation, and intervention*. Baltimore, MD: University Park Press, 1974. xv, 670 p \$14.50.—Critically reviews articles by P. Menyuk (see PA, Vol 53:Issue 3) and R. F. Cromer (see PA, Vol 53:Issue 3) on receptive language.

4938. Tallmer, Margot; Formanek, Ruth & Tallmer, Jill. (Hunter Coll, City U New York) **Factors influencing children's concepts of death.** *Journal of Clinical Child Psychology*, 1974(Sum), Vol 3(2), 17-19.—Hypothesized that the awareness of death as universal is a function of age, that the understanding of irreversibility is not demonstrated until age 10, and that children of lower socioeconomic status would have a more adequate conception of death. 199 3-9 yr olds were administered a questionnaire dealing with animate and inanimate concept acquisition, 3 Thematic Apperception Test cards, and 5 sentence completion items. 110 parents were individually interviewed concerning their explanations to their children about death. Results indicate the validity of the hypothesis.—*A. Krichev*.

4939. Tindall, Robert C. & Ratliff, Richard G. (U Wyoming) **Interaction of reinforcement conditions and developmental level in a two-choice discrimination task with children.** *Journal of Experimental Child Psychology*, 1974(Oct), Vol 18(2), 183-189.—540 1st, 4th, and 8th graders, equally divided by sex, performed a 2-choice discrimination task under 1 of 3 reinforcement conditions: reward (R) for correct responses, punishment (P) for incorrect responses, or reward and punishment (RP) for correct and incorrect responses. Half the Ss were tested by a male E; half, by a female E. Across all developmental levels, learning was superior in the P group. Complex interactions involving sex of S and E underline the importance of organismic variables in discrimination learning and in specifying parameters of reinforcer effectiveness.—*Journal abstract*.

4940. Townsend, David J. (Montclair State Coll) **Children's comprehension of comparative forms.** *Journal of Experimental Child Psychology*, 1974(Oct), Vol 18(2), 293-303.—Tested 72 3.5-5.5 yr old children on their comprehension of the terms *taller*, *shorter*, *more*, and *less* in 5 types of sentences: truncated, explicit standard, expanded explicit standard, 2-dimensional 2nd-clause subject noun, and 2-dimensional 2nd-clause subject pronoun. Many Ss performed poorly on *less* and *shorter* in truncated sentences; the presence of explicit comparative cues did not improve these Ss' performance. Ss who performed perfectly on truncated sentences still had difficulty understanding 2-dimensional comparisons, especially those with a 2nd-clause subject pronoun. These Ss interpreted only the 1st clause of the 2nd-clause subject pronoun sentences. (16 ref)—*Journal abstract*.

4941. Umansky, Richard. (Children's Hosp Medical Ctr, Northern California Regional Child Development Ctr, Oakland) **Effect of a hand sock on prehension in**

**infancy.** *Developmental Psychobiology*, 1974(Sep), Vol 7(5), 407-419.—In 67 4-12 mo old human infants a briefly applied hand sock frequently resulted in marked prehensile disuse of the socked arm (SA) in excess of the sock's mechanical restriction. Most Ss failed to reach with the SA for midline objects on a majority of trials while continuing to use the unsocked arm (UA). The onset of disuse was rapid, as was resumption of use after sock removal. The SA disuse was attributed to the effect of excess contactual input from the SA. Younger Ss often appeared not to recognize the option to attempt prehension with the SA, and older ones were capable at times of deliberate disuse of the arm and could reverse existing patterns of SA disuse. Older Ss also displayed (a) better awareness of the handicapping effects of the sock in the framework of an improved concept of arm structure and function and (b) better adaptive and compensatory responses including substitute use of the UA. Data suggest a general transition from peripheral to central control of prehensile intention during the 2nd half of the 1st year. (23 ref)—*Journal abstract*.

4942. Wickens, Christopher D. (U Illinois) **Temporal limits of human information processing: A developmental study.** *Psychological Bulletin*, 1974(Nov), Vol 81(11), 739-755.—Presents a schematic model of the human information processing system, and within this framework discusses differences between adults and children in information processing limits. It is tentatively concluded that some irreducible maturational differences in processing rate are present, along with differences due to nonprocessing factors of incentive, motivation, attentiveness, and practice. The following areas of investigation of rapid information processing are discussed as they relate to reported or potential developmental research: tachistoscopic recognition, visual search, stimulus familiarity, stimulus sequential effects, choice reaction time, and central channel limitations. Tentative conclusions are drawn concerning possible loci in the processing model of age differences in processing rate capacity. (65 ref)—*Journal abstract*.

4943. Winer, Gerald A. & Kronberg, Debra D. (Ohio State U) **Children's responses to verbally and pictorially presented class-inclusion items and to a task of number conservation.** *Journal of Genetic Psychology*, 1974(Sep), Vol 125(1), 141-152.—Presented verbal and pictorial class-inclusion questions to 24 children in kindergarten through Grade 6, and found evidence indicating that the purely verbal form of the question was less difficult than the pictorial form. A comparison of the development of class-inclusion behavior and conservation indicates that conservation developed at a younger age and at a faster rate than did class-inclusion behavior. Results are interpreted in terms of the competence-performance distinction.—*Journal abstract*.

### Emotional & Personality Development

4944. Anthony, E. James. (Washington U, Medical School) **The syndrome of the psychologically invulnerable child.** In E. J. Anthony & C. Koupernik (Eds), *The child in his family: Children at psychiatric risk: III*. New York, NY: John Wiley & Sons, 1974. xxi, 547 p.—Discusses various aspects of invulnerability and offers

steps that can be taken to make children relatively invulnerable to the stresses of life. (16 ref)

4945. **Bamber, James H.** (Queen's U Belfast, Northern Ireland) **The fears of adolescents.** *Journal of Genetic Psychology*, 1974(Sep), Vol 125(1), 127-140.—Investigated the self-reported fears and selected personality characteristics of 1,112 adolescents, using the Fear Survey Schedule and the Eysenck Personality Inventory. Analysis of the results indicates that there were considerable sex differences and to a lesser extent differences between intellectual, socioeconomic, and age groups. Comparisons are made with other relevant studies, and possible explanations are discussed. (25 ref)—*Journal abstract*.

4946. **Berger, David F.** (State University Coll New York, Cortland) **The reaction to frustration of middle- and lower-class children.** *Journal of Experimental Child Psychology*, 1974(Oct), Vol 18(2), 269-279.—In 2 experiments, 49 4-6 yr old white children from lower and middle socioeconomic backgrounds were exposed separately to the same operant analog of the A. Amsel "double alley" procedure. 2 measures of responding, latency of press and pressing rate, were taken following frustration and reward of prior responding. Middle-class Ss responded slower, in both measures, on nonrewarded compared to rewarded trials, a reversal of the more frequently observed frustration effect (FE). The lower-class Ss showed the usual FE, shorter response latencies following frustrative nonreward. The FE did not occur with the rate measure. Class differences in perceived locus of control of reinforcement and maximizing vs response patterning behavior in 3-choice probability learning tasks are discussed. (24 ref)—*Journal abstract*.

4947. **Ferreira, G. V.** [Experiencing as psychopedagogic category.] (Afri) *Suid-Afrikaanse Tydskrif vir die Pedagogiek*, 1974(Jul), Vol 8(1), 51-73.—Presents a phenomenological discussion of the concept of "experiencing" as a mode of actualization of becoming and learning in the psychic life of the child. Experiencing is viewed as the intentional, continuing act of moving toward and meeting reality which leads to knowledge (both preconceptual and conceptual). It is suggested that learning and becoming are similar in their actualization by experience. Because the experiencing of the child is a clarifying process aimed at developing the psychic structures of becoming and learning, it is concluded that experiencing should be included as a psychoeducational category. (38 ref)—*English summary*.

4948. **Jackson, Dorothy W.** (Ohio State U) **Stage factors relating alienation and self-role diffusion.** *Journal of Vocational Behavior*, 1974(Oct), Vol 5(2), 269-274.—Conducted a study, controlling for age, sex, and vocational commitment of 290 adolescents (ages 17-19 and 20-22), to determine the relationship between self- and social alienation attitudes and the identity-role crisis of the adolescent stage. D. W. Jackson's DJ Social-Self-Alienation Scale was administered to all Ss. Specific subscale differences due to age and sex for social alienation were found. Younger adolescents expressed greater self-alienation than older males, who were significantly more self-satisfied than both younger and older females and younger males. The hypothesis that self-alienation reflects conflict and dissatisfaction emerg-

ing from identity-role discrepancies during the adolescent stage of psychosocial development, and that it would decrease with vocational commitment, was supported for males but not females. (16 ref)—*Journal abstract*.

4949. **Kaufman, Gershen.** (Michigan State U, Counseling Ctr) **The meaning of shame: Toward a self-affirming identity.** *Journal of Counseling Psychology*, 1974(Nov), Vol 21(6), 568-574.—Considers that shame becomes inevitably bound up with the process of identity formation which underlies man's striving for self, for valuing, and for meaning. The experience of shame is a fundamental sense of being defective as a person, accompanied by fear of exposure and self-protective rage. The shame-inducing process involves one significant person breaking the interpersonal bridge with another. Original shame inducement occurs prior to language development; it is precipitated by parental failure to respond appropriately to a child's needs and by parental anger toward the child. The process of restoring the severed interpersonal bridge enables one to transcend shame and begin to develop a self-affirming identity.—*Journal abstract*.

4950. **Kokenes, Barbara.** (Millersville State Coll) **Grade level differences in factors of self-esteem.** *Developmental Psychology*, 1974(Nov), Vol 10(6), 954-958.—Investigated the construct validity of the Coopersmith Self-Esteem Inventory. Factor analyses were performed using approximately 1,500 students in public schools in each of Grades 4-8. 3 factors emerged in the grade-level analyses that were related to the Self subscale proposed by S. Coopersmith. 2 factors represented negative attitudes toward the self, while 1 factor represented positive attitudes. Items that loaded into these factors were moderately congruent with the subscale items. 2 factors emerged related to the Home subscale. Items that loaded into these factors were highly congruent with the subscale items. 2 factors expressing bipolar attitudes emerged that were related to the School subscale. The items that loaded into these factors were moderately congruent with the subscale items. One factor emerged that expressed positive attitudes toward the self derived from peers. This factor was related to the Peer subscale through a moderate amount of common items. Grade-level differences were observed in the comparative amount of variance accounted for by factors, as well as the occurrence of factors.—*Journal abstract*.

4951. **Koocher, Gerald P.** (Children's Hosp Medical Ctr, Developmental Evaluation Clinic, Boston, MA) **Emerging selfhood and cognitive development.** *Journal of Genetic Psychology*, 1974(Sep), Vol 125(1), 79-88.—Designed a study to provide empirical support for viewing personality development from a cognitive framework. With controls established for IQ and socioeconomic status, 75 6-15 yr olds were classified by level of cognitive functioning according to Piaget's system. Measures of self-concept, other concept, and ideal self were obtained, and differences were compared within and across groups. Intergroup differences show the ideal-self ratings increasing in uniformity and positive value as Ss moved beyond the preoperational

level of cognitive functioning. No significant sex differences were found.—*Journal abstract.*

4952. Masler, Ernest G. **The subjective perception of two aspects of time: Duration and timelessness.** *International Journal of Psycho-Analysis*, 1973, Vol 54(4), 425-429.—Suggests that infants tend to form "timeless" groupings of similar perceptions, such as "bad" or frustrating impressions of the mother. As the ego matures, this tendency gives way to the recognition that complex objects may change as time passes. However, traces of this grouping tendency or similar habits are found in psychoanalytic practice, primitive cultures, and elsewhere. Of particular interest is the immature, countertherapeutic belief that to change is to die.—C. T. Sullivan.

4953. Mitchell, John J. (U Alberta; Edmonton, Canada) **Moral dilemmas of early adolescence.** *School Counselor*, 1974(Sep), Vol 22(1), 16-22.—Considers that the moral dilemmas of early adolescence arise from the interaction between the stress generated by personal-internal growth and conflicts from social-external growth. The discussion focuses on dilemmas of sexual behavior, independence, conscience, double standards, and conformity. Counselors are encouraged to identify (a) factors inherent in adolescent growth requirements, (b) deficiencies within the adolescent, and (c) deficiencies within the environment. The first requires the counselor to give encouragement to the client, while the other 2 may require counseling for the client.—A. S. Helge.

4954. Nowicki, Stephen & Duke, Marshall P. (Emory U) **A preschool and primary internal-external control scale.** *Developmental Psychology*, 1974(Nov), Vol 10(6), 874-880.—Attempted to construct a preschool and primary form of an internal-external control scale that would be comparable to already completed forms for older Ss. On the basis of construct validation procedures, certain requirements were established for the new measure. After pilot work, yielding a 26-item cartoon format, the scale was administered to 240 5-8 yr olds. Data reflecting achievement, interpersonal distance, and social desirability were also gathered. Results indicate that the test met internal and external validity requirements. (24 ref)—*Journal abstract.*

4955. Pawlicki, Robert E. (State University Coll New York, Oswego) **Locus of control and the effectiveness of social reinforcers.** *Journal of Genetic Psychology*, 1974(Sep), Vol 125(1), 153-159.—Tested the hypothesis that the developmental change in the effectiveness of social reinforcement is related to changes in locus of control. 146 Ss in Grades 3, 4, 6, and 7 responded to the Locus of Control Scale for Children and to a simple game measuring the effectiveness of either praise-connoting or information-connoting social reinforcers. Results do not indicate a developmental change in the effectiveness of various types of social reinforcers, but show a consistent superiority in the effectiveness of information connoting social reinforcers at each grade level. This contradiction of previous research is discussed in terms of task complexity and dependent measures. The data also reveal a developmental trend of increasing feelings of control over the environment with increased maturity. (15 ref)—*Journal abstract.*

4956. Provence, Sally. (Yale U, Child Study Ctr, Child Development Unit) **Some relationships between activity and vulnerability in the early years.** In E. J. Anthony & C. Koupornik (Eds), *The child in his family: Children at psychiatric risk: III*. New York, NY: John Wiley & Sons, 1974. xxi, 547 p.—Presents 4 case studies that suggest that the child's capacity to be active in relation to the external world is an essential component of psychological development. The assumption is that such activity is both essential to and an indicator of psychic differentiation and of many aspects of early ego development.

4957. Raphael, Beverley. (Broughton Hall Psychiatric Clinic, Leichhardt, NSW, Australia) **Youth in a world of change.** *Australian & New Zealand Journal of Psychiatry*, 1974(Jun), Vol 8(2), 131-137.—Describes adolescent responses to 3 areas of life change or crisis. It is proposed that these responses may reflect and accentuate patterns of response to the adolescent developmental crisis. 22 recently bereaved adolescents showed denial, anger, and possibly withdrawal and were often threatened by the new roles into which they were forced by their fathers' deaths, particularly the oedipal aspects of these roles. Of 22 adolescent girls experiencing their 1st pregnancy, 11 showed evidence of some emotional disorder: 17 girls seeking termination of pregnancy were evaluated. Denial, rationalization, and ambivalent feelings were marked. It is concluded that these 3 areas have potential for preventive intervention in the form of specific ego support. Such intervention would be aimed at decreasing the incidence of subsequent health impairment in those at risk.—*Journal abstract.*

4958. Shotter, John. (U Nottingham, England) **Acquired powers: The transformation of natural into personal powers.** *Journal for the Theory of Social Behaviour*, 1973(Oct), Vol 3(2), 141-156.—Describes the process whereby personal powers are derived from natural powers. Specifically, the topic is what goes on between and within a child and his mother during that part of his early development which results in him being transformed from a natural agent—a child of nature—into an individual personality—a child of culture. The issue of whether personal powers are acquired or innate is discussed. Psychological symbiosis in the child is detailed, as is the development of play behavior. It is concluded that human beings have no personal powers at birth, but gain them in negotiated interaction with those who already possess them. (17 ref)—R. S. Albin.

4959. Yates, Gregory C. (U Adelaide, SA, Australia) **Influence of televised modeling and verbalization on children's delay of gratification.** *Journal of Experimental Child Psychology*, 1974(Oct), Vol 18(2), 333-339.—Studied voluntary delay of gratification in 56 9-yr-old children 4 wks prior to, immediately after, and 4 wks subsequent to exposure to 1 of 4 televised films. The modeling group observed an adult female model exemplify high-delay behavior. The persuasion group observed the model verbalize good reasons for waiting. The persuasion-modeling group observed the model exemplify high-delay behavior and verbalize reasons for waiting. Ss in each of the treatment groups emitted more delay choices on the posttest than control group Ss who observed the model exhibit neutral behavior. The greatest magnitude of change occurred when modeling

and persuasive cues were combined. Treatment effects were still in evidence for the modeling and the persuasion-modeling groups after a period of 4 wks.—*Journal abstract.*

### Social Behavior & Family Relations

4960. Abramson, Paul R. & Abramson, Seth D. (U Connecticut) **A factorial study of a multidimensional approach to aggressive behavior in black preschool age children.** *Journal of Genetic Psychology*, 1974(Sep), Vol 125(1), 31-36.—A multidimensional aggression scale developed by P. Abramson et al (1972) containing 34 variables of aggression was used to score the doll-play responses of 123 black preschool-age children. 6 factors were extracted on the basis of the amount of total variance contributed by each factor and the number of loadings exceeding .50. To assist in verbal reference these factors were labeled as follows: Factor 1, Violent Aggression Toward the Family; Factor 2, Violent Aggression by the Family; Factor 3, Aggression by the Self; Factor 4, Aggression Directed Toward the Self; Factor 5, Assertion Directed Toward Others; and Factor 6, Assertion Directed Toward the Family. The data support the contention that aggression can be conceptualized along several dimensions. (16 ref)—*Journal abstract.*

4961. Aldrich, C. Knight. **Youth's fulfillment of adult prophecies.** *Australian & New Zealand Journal of Psychiatry*, 1974(Jun), Vol 8(2), 127-129.—Posits that the quickness of youth's response to social change makes parents and other adults nervous and triggers the expectation that a change in youthful manners will lead inevitably to a change in morals. Since this expectation can become a self-fulfilling prophecy, adults can create the problems they seek to avoid if they communicate to their children their expectations of antisocial behavior. It is argued that, to counterbalance the sanctions of a permissive society, youth needs adult confidence in its capacity to set its own limits. If adults have confidence in youth in a world of change, youth will have confidence in itself. (15 ref)—*Journal abstract.*

4962. Allen, Vernon L. & Allen, Patricia S. (U Wisconsin, Madison) **On the attractiveness of forbidden objects.** *Developmental Psychology*, 1974(Nov), Vol 10(6), 871-873.—Toys were ranked for attractiveness by 15 preschool and 21 4th-grade children. After the initial ranking, the S was told that he could not play with one of the toys. Each toy was subsequently ranked a 2nd time. Results show a strong decrease in the attractiveness of the forbidden toy by preschoolers, but an increase in attractiveness was exhibited by 4th graders. Results suggest that a perceived association between an object's being forbidden and its attractiveness may be learned through the course of socialization.—*Journal abstract.*

4963. Anthony, E. James. (Washington U, Medical School) **Children at risk from divorce: A review.** In E. J. Anthony & C. Koupernik (Eds), *The child in his family: Children at psychiatric risk: III*. New York, NY: John Wiley & Sons, 1974. xxi, 547 p.—Examines the clinical liabilities for the children of divorced parents and the extent to which these liabilities can be modified by appropriate interventions.

4964. Bach, George R. & Goldberg, Herb. (Inst of Group Psychotherapy, Los Angeles, CA) **Creative aggression.** Garden City, NY: Doubleday, 1974. 407 p. \$8.95.—Demonstrates the grave damage to mental health that can result from suppression of natural anger and aggression and presents case histories which reveal the dangerous hostility exuded by "nice" parents, spouses, teachers, bosses, and psychotherapists. It is shown how the constructive use of aggression can remove artificiality from interpersonal relationships and open the way for real contact and intimacy. (6 p ref)

4965. Barnett, Mark A. & Bryan, James H. (Northwestern U) **Effects of competition with outcome feedback on children helping behavior.** *Developmental Psychology*, 1974(Nov), Vol 10(6), 838-842.—80 2nd- and 5th-grade boys played a bowling game within either a competitive or noncompetitive atmosphere. Within the competition conditions, the children were randomly assigned outcomes (win, tie, or lose) and were given feedback accordingly. Each child was subsequently given the opportunity to donate to a charity. While competition with feedback was found to decrease altruism, one important limiting factor was found to be the individual's outcome within the situation. (20 ref)—*Journal abstract.*

4966. Biller, Henry B. (U Rhode Island) **Paternal deprivation: Family, school, sexuality, and society.** Lexington, MA: D. C. Heath, 1974. xi, 226 p.—Presents an analysis of the various forms of paternal deprivation and their effects, the influence of fathering on cognitive functioning and school adjustment, how inadequate fathering can contribute to the development of personal, sexual, and social problems, biological and sociocultural perspectives on paternal deprivation and sex-role functioning, and paternal deprivation and mother-child relationships. (37 p ref)

4967. Bulum, Nissan. (U Minnesota) **An investigation of the word order parameter of a parent-child verbal interaction in a relatively free order language.** *Language & Speech*, 1974(Apr-Jun), Vol 17(2), 182-186.—A number of investigators have assumed that the relatively free word order of a given language was the relatively free word order which the child encountered during his language acquisition period. This study investigated the word order of a Hebrew speaker's verbal interaction with (a) his 2-yr-old daughter and (b) an adult. Results show that the father used a relatively free word order in his verbal interaction with the adult and a fairly rigid word-order in his verbal interaction with his child. Some possible interpretations are discussed.—*Journal abstract.*

4968. Campbell, Dugal. (Queen's U, Kingston, Ontario, Canada) **Sucking as an index of mother-child interaction.** In J. F. Bosma (Ed), *Oral sensation and perception: Development in the fetus and infant: Fourth symposium*. Washington, DC: US Government Printing Office, DHEW Pub No (NIH) 73-546, 1973. xix, 419 p. \$8.55.

4969. Cicirelli, Victor G. (Purdue U) **Relationship of sibling structure and interaction to younger sib's conceptual style.** *Journal of Genetic Psychology*, 1974(Sep), Vol 125(1), 37-49.—Investigated the effects of the older sibling's aid in an object-sorting task on the younger sibling's conceptual style. 160 sibling pairs from

2-child families were sampled from 16 subgroups defined by the following factors: grade level of younger sibling (kindergarten or 2nd grade), age spacing between siblings (2 or 4 yrs), sex of younger sibling, and sex of older sibling. For half the pairs, the younger sibling sorted alone; for the remainder, the older sibling aided and the children's interaction was recorded. Children aided by siblings used descriptive style less than children who worked alone; children aided by siblings 4 yrs older used inferential style more than children aided by siblings 2 yrs older; children with opposite-sex siblings used relational style more than children with same-sex siblings. Certain sibling interaction behaviors were related to more mature conceptual style. (19 ref) —*Journal abstract.*

4970. Dale, Philip S. (U Washington) **Hesitations in maternal speech.** *Language & Speech*, 1974(Apr-Jun), Vol 17(2), 174-181.—Investigated the possibility that a significant source of segmentation information concerning the syntactic structure of sentences might be present in hesitation placement in maternal speech. 6 mothers were recorded speaking to their younger children (2-3½ yrs old) and to their older children (5-8 yrs old). Hesitations occurred more often at sentence boundaries in speech to younger children. However, using 3 distinct definitions of phrase boundary, no tendency was found for hesitations to occur more often at phrase boundaries in speech to younger children.—*Journal abstract.*

4971. DePalma, David J. (Loyola U, Chicago) **Effects of social class, moral orientation, and severity of punishment on boys' moral responses to transgression and generosity.** *Developmental Psychology*, 1974(Nov), Vol 10(6), 890-900.—In 2 experiments with a total of 128 2nd- and 3rd-grade boys, the effects of social class, moral orientation, and severity of punishment on moral responses to transgression and generosity were investigated. In Exp I, a modified version of J. Aronfreed's task (see PA, Vol 38:2542), the response measures were the self-critical and reparative responses on the transgression trial, the self-critical responses prior to this trial, and the number of candies removed by the S during the task. In Exp II, the S was asked if he wished to donate any of his candy from Exp I to a "needy" child. Results indicate a differential effect of punishment treatment on the responses of the various moral orientation Ss. The flexible moral orientation Ss punished themselves less and donated more candy than the rigid Ss across the punishment conditions. The data suggest that the flexible moral orientation Ss may be more "mature" and "internalized" than the rigid orientation Ss. (30 ref) —*Journal abstract.*

4972. Dunn, Patrick P. (U Wisconsin, La Crosse) **Fathers and sons revisited: The childhood of Vissarion Belinskii.** *History of Childhood Quarterly: The Journal of Psychohistory*, 1974(Win), Vol 1(3), 389-407.—Describes the close relationship between V. Belinskii and his father, which was uncharacteristic of 19th century Russian families, and speculates on the relationship between traditional Russian child rearing and the conditions leading to the 1917 revolution. (4 p ref)

4973. Gottfried, Nathan W. & Seay, Bill. (Louisiana State U) **Early social behavior: Age and sex baseline data from a hidden population.** *Journal of Genetic*

*Psychology*, 1974(Sep), Vol 125(1), 61-69.—Studied the influences of age and sex on early social behavior in 37 3-5 yr olds in a day-care setting and 16 5-yr-olds in a Head Start center; most of the Ss were black. With the use of a standard observational category system, individuals were observed while in a 15-min play session in 3-child groups homogeneous as to age and sex. Results for 14 object-directed and 9 peer-social categories indicate that males and older children engaged more frequently in peer-social activity. However, no pattern of age or sex effects was found for object-directed behavior. Of special importance were the higher scores for verbalization for boys in both samples.—*Journal abstract.*

4974. Grandy, Thomas G. & Stahmann, Robert F. (U Iowa) **Types produce types: An examination of personality development using Holland's theory.** *Journal of Vocational Behavior*, 1974(Oct), Vol 5(2), 231-239.—Tested J. L. Holland's hypothesis that parents encourage the development of their own personality types (realistic, investigative, artistic, social, enterprising, and conventional) in their offspring. Data were collected by personal interviews from 507 college freshmen at a large midwestern university. Parent's personality types (occupations) were compared to offsprings' personality types (expressed occupational choices) using the Kolmogorov-Smirnov 1-sample test to determine whether the comparisons were due to chance. Results indicate that relationships existed between the personality types of fathers and sons, fathers and daughters, and mother and daughters, but not mothers and sons.—*Journal abstract.*

4975. Hardgrove, Carol & Warrick, Louise H. (U California, San Francisco) **"How shall we tell the children?"** *American Journal of Nursing*, 1974(Mar), Vol 74(3), 448-450.—Presents a communications model for parents to use in telling their children about the death of an expected baby. The model is based upon principles from communication and learning theories. Children's reactions to death are related to parental attitudes and to the developmental stage of the child. Children observe and imitate parental responses to death. Parents who openly use the model, communicate their grief, and explore their children's understanding and feelings about death will develop effective ways of coping with death. A child's reaction to death follows a developmental sequence: (a) fear of loss of parental love, (b) fear of his own death, and (c) feelings of survivor guilt. Interview techniques for nursing assessments and interventions in a family system confronted with death are discussed.—R. G. Gibson.

4976. Jayanagaraja, Dr. **The child in the family.** *Child Psychiatry Quarterly*, 1974(Apr), Vol 7(2), 11-13.—Discusses the child in the family, the parental role, and the emotional set-up and development of this interaction in India. The stages of parenthood and childhood are detailed.

4977. Jensen, Larry & Buhanan, Karl. (Brigham Young U) **Resistance to temptation following three types of motivational instructions among four-, six-, and eight-year-old female children.** *Journal of Genetic Psychology*, 1974(Sep), Vol 125(1), 51-59.—A total of 30 Ss were given 3 types of motivational instructions prior to a resistance to temptation test. 4-yr-old Ss deviated less under fear or punitive oriented instructions than under

reward or empathy oriented conditions, but 6-yr-olds deviated less under promised reward. 8-yr-olds performed as well or better when motivated by more intrinsic empathy-oriented instructions. All manipulations were more effective than the nurturance-nurturance withdrawal operation used in previous experiments. The latter results were interpreted as demonstrating the importance of external sanctions on children's moral behavior. It is concluded that the employment of either direct or indirect sanctions promotes obedience to the rules among young female children. It is suggested that resistance to temptation among female children may first be governed by a fear of punishment, expand to include a desire for a reward, and then progress to a more intrinsic motivation, or at least to a hedonism which results in satisfaction to another.—*Journal abstract.*

4978. Kerckhoff, Alan C. & Huff, Judith L. (Duke U) **Parental influence on educational goals.** *Sociometry*, 1974(Sep), Vol 37(3), 307-327.—Used interview data from 76 12th-grade and 67 9th-grade boys and their parents to determine whether parent-child agreement on goals can be accepted as evidence of parental influence. It is concluded that (a) parent-child agreement cannot be viewed as a wholly spurious basis for imputing influence, although any simple agreement measure tends to overstate the amount of influence involved; (b) agreement measures based on the child's report of the parent's goals lead to different outcomes than those based on the parent's own report; (c) the child's report of the parent's goal reflects the child's projection of his own goals and criteria of goal-setting onto his parents; and (d) evidence of direct goal transmission from parent to child is stronger among the older boys, but a paternal influence in the form of the son's modeling his father appears to be stronger among the younger boys. Agreement on goals did not vary with the quality of the parent-child relationship. (15 ref)—*Journal abstract.*

4979. Kern, Stephen. (Northern Illinois U) **Explosive intimacy: Psychodynamics of the Victorian family.** *History of Childhood Quarterly: The Journal of Psychohistory*, 1974(Win), Vol 1(3), 437-461.—Questions the traditional image of the typical Victorian family as stable, protective, and peaceful. Based on an examination of family pressures and sexual fears, the Victorian family is seen as a source of anxiety and conflict leading to excessive intimacy and interdependence. (3 p ref)

4980. Leiderman, P. Herbert & Leiderman, Gloria F. (Stanford U, Medical School) **Familial influences on infant development in an East African agricultural community.** In E. J. Anthony & C. Koupemnik (Eds), *The child in his family: Children at psychiatric risk: III*. New York, NY: John Wiley & Sons, 1974. xxi, 547 p.—Studied the relationship between psychological test performance, familial, economic, and demographic variables, and child-rearing practices in 67 infants and their mothers. Results indicate that (a) familial economic level was related to the "average level" of infant test performance and not the "rate" of development, (b) caretaking behaviors varied with the economic level of the family, (c) infant caretaking involved multiple "mothering," and (d) the mother's presence was positive-

ly associated with the rate of psychological development during the infant's 1st yr.

4981. Leiderman, P. Herbert. (Stanford U, Medical School) **Mothers at risk: A potential consequence of the hospital care of the premature infant.** In E. J. Anthony & C. Koupemnik (Eds), *The child in his family: Children at psychiatric risk: III*. New York, NY: John Wiley & Sons, 1974. xxi, 547 p.—Studied the effects of early mother-infant interaction in groups of mothers of prematures who had early contact with their infants, mothers of prematures who were separated from their infants, and mothers of full-term infants. Findings indicate that full-term mothers smiled more at their infants and maintained more ventral contact with them and that maternal self-confidence was lower in the separated group. It is suggested that mothers of prematures are particularly at risk when deprived of contact with their infants in the immediate postpartum period.

4982. Moore, Nancy V.; Everson, Carolyn M. & Brophy, Jere E. (U Texas, Austin) **Solitary play: Some functional reconsiderations.** *Developmental Psychology*, 1974(Nov), Vol 10(6), 830-834.—Observed solitary play in kindergartners to investigate the Sex  $\times$  Birth Order interaction noted in 2 previous studies by R. Herron and B. Sutton-Smith (1971) and by L. Laosa and J. Brophy (1972). The sample included 26 firstborn males, 16 firstborn females, 36 later-born males, and 36 later-born females. The expected Sex  $\times$  Birth Order interaction was not replicated. However, the data reveal that contrary to traditional views, most solitary play observed was indicative of independence and maturity rather than immaturity or dependency. The only children who showed immature solitary play patterns as a group were twins. Boys and girls showed similar patterns, although the girls showed more educationally oriented solitary play.—*Journal abstract.*

4983. Moss, Howard A. (NIMH, Child Research Branch, Bethesda, MD) **Communication in mother-infant interaction.** In L. Krames, P. Pliner & T. Alloway (Eds), *Nonverbal communication*. New York, NY: Plenum Press, 1974. x, 212 p. \$14.95.—Traces the developmental role of crying behavior during the early months of life. It is noted that different types of cries can be discriminated. The general effect of crying on maternal behavior, differences in maternal response, and the mother's potential for shaping crying behavior seem to be important and prepotent factors reflecting both the structure and the growth of this early communication system. (17 ref)

4984. Muensterberger, Werner. (State U New York, Downstate Medical Ctr, Brooklyn) **Some reflections on multiple mothering, cross-culturally.** *Psychosocial Process*, 1974(Spr), Vol 3(1), 57-71.—Discusses the effects of multiple mothering on the ability to maintain stable relationships and the implications for day care. Using information provided by a Thai student about child-rearing practices, an anthropological study of 2 Tahitian communities, and observations of 2 individuals in therapy, it is concluded that multiple mothering produces unstable relationships. (18 ref)

4985. Murphy, Henry B. (McGill U, Montreal, Quebec, Canada) **Long-term foster care and its influence on adjustment to adult life.** In E. J. Anthony & C.

Koupernik (Eds), *The child in his family: Children at psychiatric risk: III*. New York, NY: John Wiley & Sons, 1974. xxi, 547 p.—Studied the influences of foster home care in 199 former and 50 current foster home children. Results indicate that "suburban location" was most associated with poor adult adjustment in the former foster child. While current Ss had a better identification with their foster homes than the urban-placed, were better accepted by the foster parents' relatives, and showed more signs of personality integration, they showed more signs of immaturity and neurosis and were poorer at solving concrete problems. (19 ref)

4986. Myers, Wayne A. (Cornell U, Medical Ctr, New York) **The primal scene: Exposure to parental intercourse.** *Medical Aspects of Human Sexuality*, 1974(Sep), Vol 8(9), 156-165.—Presents a psychoanalytically-oriented discussion of ancillary factors which may enhance or mitigate the effects of early primal scene (i.e., parental intercourse) observations on the young child. 6 of these factors are identified and related to the child's behavior after exposure: the child's age and state of ego development, stage of psychosexual development, frequency and chronicity of exposure, the exact nature of the observation, immediate parental response to the episode, and the long-range parental response. Various interpretations of the scene by the child are discussed, including the perception of the sexual encounter as an aggressive act. Frequent exposure is much more psychologically harmful and traumatic than a single, inadvertent exposure. A case history of exposure to the primal scene is presented, and suggestions for both parents and therapists in handling the situation are included.—*L. Gorsey*.

4987. Pareek, Udai & Dixit, Narendra. (Indian Inst of Management, India) **Personal correlates of cooperative game behaviour.** *Psychologia: An International Journal of Psychology in the Orient*, 1974(Jun), Vol 17(2), 94-98.—Used the Maximizing Difference Game to study cooperative behavior. The game is played dyadically with the players not visible to each other. Ss were preadolescent, 20 boys and 20 girls. 23 independent variables were employed. Results indicate that 3 of the independent variables correlated positively with the dependent variable at a significant level, and 2 of them correlated significantly in a negative direction. (25 ref)—*R. D. Nance*.

4988. Pareek, Udai & Dixit, Narendra. (Indian Inst of Management, Ahmedabad) **An analysis of cooperation and competition amongst preadolescents.** *Indian Journal of Social Work*, 1974(Apr), Vol 35(1), 73-85.—Administered to 150 preadolescent school children a Cooperative and Competitive Disposition Inventory and a Cooperative and Competitive Proneness Inventory. Ss also participated in 2-person games where each S wants either to maximize the difference in gain between partner and self, or to play so that the partner gets equal points. The variables measured included cooperation, competition, cooperative disposition, competitive disposition, cooperative proneness, competitive proneness, trust, trustworthiness, forgiveness, repentance, retaliation, and exploitation. Relationships between the different variables are discussed and suggestions are given for further studies.—*I. W. Kidorf*.

4989. Post, Barbara & Hetherington, E. Mavis. (U Wisconsin, Madison) **Sex differences in the use of proximity and eye contact in judgments of affiliation in preschool children.** *Developmental Psychology*, 1974(Nov), Vol 10(6), 881-889.—Investigated sex differences in preschool children's use of nonverbal cues in judgments of affiliation in 2 experiments. Ss were a total of 40 male and 40 female 3-6 yr olds. Results of Exp I show that although both 4-yr-old boys and girls used proximity cues in judging liking, only girls showed an increase in the accuracy of use of this cue by age 6. At age 4 neither boys nor girls were functioning above chance in their use of eye contact cues in judgments of affiliation, and again girls alone showed improvement by age 6. Exp II demonstrates that discrimination training involving the proximity cue facilitated the correct use of this cue in the judgments of 4-yr-old girls but not in boys. (35 ref)—*Journal abstract*.

4990. Provence, Sally. (Yale U, Child Study Ctr) **A program of group day care for young children.** *Psychosocial Process*, 1974(Spr), Vol 3(1), 7-13.—Discusses problems that arose when young children were separated from their parents in a day care center. Measures used to alleviate the effect of separation are described.

4991. Ransh, Harold L.; Barry, William A.; Hertel, Richard K. & Swain, Mary A. (U Massachusetts, Amherst) **Communication conflict and marriage.** San Francisco, CA: Jossey-Bass, 1974. xii, 250 p.—Presents ways to study the interactions of married couples in conflict-laden contexts, using a technique called "improvisations." Among the topics explored within 6 interaction categories (cognitive, resolving, reconciling, appealing, rejecting, and coercing) are orientation toward marriage, sex differences, constructive and destructive conflict, pregnancy, and childbirth. (11 p ref)

4992. Steward, Margaret S. & Steward, David S. (U California, Medical School, Davis) **Effect of social distance on teaching strategies of Anglo-American and Mexican-American mothers.** *Developmental Psychology*, 1974(Nov), Vol 10(6), 797-807.—Examined the variable of social distance between teacher and learner by observing the pattern of interaction between mothers and their own preschool sons, boys from a similar background, and boys from a different ethnic and social class background. Ss were 30 3-yr-old Mexican-American and 30 3-yr-old Anglo-American boys. Anglo-American and Mexican-American mothers from middle and lower classes were videotaped as they taught a cognitive and a motor task to each of 3 children. The Parent Interaction Code was employed to analyze the teaching loop behavior. Programmatic and instructional variables were different but stable for each ethnic group across social distance; patterns of feedback and child response shifted significantly across social distance. (30 ref)—*Journal abstract*.

4993. Stinnett, Nick; Farris, Joe A. & Walters, James. (Oklahoma State U) **Parent-child relationships of male and female high school students.** *Journal of Genetic Psychology*, 1974(Sep), Vol 125(1), 99-106.—Compared the perceptions of 499 11th and 12th grade males and females concerning selected aspects of parent-child relationships. Significant differences were found in perceptions of males and females concerning each of the

following: source of most parental discipline during childhood, degree of praise received during childhood, source of most affection during childhood, degree to which mother found time to do things together with respondent as a child, and source of greatest parental influence in determining the kind of person the respondent is. (22 ref)—*Journal abstract*.

4994. Tuddenham, Read D.; Brooks, Jane & Milkovich, Lucille. (U California, Berkeley) **Mothers' reports of behavior of ten-year-olds: Relationships with sex, ethnicity, and mother's education.** *Developmental Psychology*, 1974(Nov), Vol 10(6), 959-995.—Mothers' descriptions of their 9-, 10-, and 11-yr-old children were secured by means of a behavior inventory of 100 items, to be sorted into "true," "not true," and "uncertain" categories. Findings are reported for 2,212 whites, 641 blacks, 117 Orientals, and 79 Chicanos from an urban, largely middle-class sample, broken down by ethnicity, sex of child, and in the case of whites and blacks, by education of the mother. Comparisons with 7 other studies, both American and British, show noteworthy agreement in problem prevalence, despite major differences in samples and in methods of investigation. (16 ref)—*Journal abstract*.

4995. Wallerstein, Judith S. & Kelly, Joan B. (U California, School of Social Welfare, Berkeley) **The effects of parental divorce: The adolescent experience.** In E. J. Anthony & C. Koupornik (Eds), *The child in his family: Children at psychiatric risk: III*. New York, NY: John Wiley & Sons, 1974. xxi, 547 p.—A study of 131 adolescents indicates that following parental divorce, many young people live through an acutely painful experience. This psychological trauma, although time-limited for most, is marked by a rapid acceleration and telescoping of normative adolescent perceptions, conflicts, preoccupations, and responses. (28 ref)

4996. Ward, Charles D.; Castro, Angela & Wilcox, Anne H. (U Maryland) **Birth-order effects in a survey of mate selection and parenthood.** *Journal of Social Psychology*, 1974(Oct), Vol 94(1), 57-64.—A survey of 139 married faculty members at a large state university confirmed the hypothesis that persons tend to marry others of the same birth order as themselves. Results also indicate that firstborn Ss desired fewer children than those who were later born, couples in which the respondent's spouse was firstborn rather than later born actually had fewer children, and the survey questionnaires were returned sooner when the respondent's spouse was firstborn than when later born. An interpretation based on the more socially responsible character of firstborns is suggested for the results.—*Journal abstract*.

4997. Whiteman, Martin; Brook, Judith S. & Gordon, Ann S. (Columbia U, School of Social Work) **Children's motivational perception as related to the instrumentality and effect of action.** *Developmental Psychology*, 1974(Nov), Vol 10(6), 929-935.—On the basis of F. Heider's (1958) balance conceptions, a model was developed for specifying relations between the perceived properties of an act (its instrumentality and its consequentiality) and the intentionality attributed to the act. 129 1st-, 4th-, and 6th-graders made intentionality judgments of actions described in 10 pairs of stories, each pair made up of contrasting actions varying in

instrumentality and/or consequentiality. The older Ss adhered more closely to the naive psychological model both in intentionality choice and in the reasons for their choice. The 1st-graders had more difficulty judging intentionality on the basis of an act's instrumentality as compared to its consequentiality.—*Journal abstract*.

### Adult Development & Aging

4998. Amster, Leslie E. & Krauss, Herbert H. (Hunter Coll, City U New York) **The relationship between life crises and mental deterioration in old age.** *International Journal of Aging & Human Development*, 1974(Win), Vol 5(1), 51-55.—Examined the relationship between mental deterioration in old age and recent life history. A family member or close friend completed the Geriatric Schedule of Recent Experience for each of 25 mentally deteriorated and 25 normal elderly women. Results show a positive relationship between mental deterioration and the magnitude and number of life crises.—*Journal abstract*.

4999. Antonucci, Toni. (Syracuse U) **On the relationship between values and adjustment in old men.** *International Journal of Aging & Human Development*, 1974(Win), Vol 5(1), 57-69.—Hypothesized that values should reflect the ontogenetic development of the individual, and that a person should develop values that are appropriate to his role, development, and function within the society. 40 white middle-class males were given the Havighurst Life Satisfaction Scale and several values to be rated on a semantic differential. It was shown that adjusted old men considered work-related values to be much less important than did unadjusted men. Comparison of the present older sample with a middle-aged sample revealed that hedonistic values were much more important to the older individuals than to the middle-aged sample. (40 ref)—*Journal abstract*.

5000. Beller, Suha & Palmore, Erdman. (Duke U, Ctr for the Study of Aging & Human Development) **Longevity in Turkey.** *Gerontologist*, 1974(Oct), Vol 14(5, Pt 1), 373-376.—Studied 48 individuals aged over 90 yrs and a control group of 108 younger Ss (mean age = 36 yrs) in Turkey. Results show longevity was associated with blood types P<sub>1</sub> and Le(a-b-), good health, being male, normal height and weight, simple diets with little meat, no cigarette smoking, vigorous physical activity, marriage and sexual activity, social activity, and a positive view of life. (17 ref)

5001. Bromley, D. B. (U Liverpool, England) **The psychology of human ageing.** (2nd ed). Harmondsworth, England: Penguin, 1974. 441 p. \$2.95.

5002. Brotman, Herman B. (US DHEW, Administration on Aging, Washington, DC) **Who are the aging?** In E. W. Busse & E. Pfeiffer (Eds), *Mental illness in later life*. Washington, DC: American Psychiatric Assn, 1974. vi, 301 p. \$7.

5003. Comfort, A. (Ctr for the Study of Democratic Insts, Santa Barbara, CA) **Sexuality in old age.** *Journal of the American Geriatrics Society*, 1974(Oct), Vol 22(10), 440-442.—Reminds geriatricians that many elderly people are still capable of experiencing sexual pleasure. Since sexual experiences can have generally favorable effects, such experiences should be encouraged under appropriate circumstances. Sexuality in the aged should not be rigidly suppressed as it is at present in most nursing homes and other institutions.—*Journal abstract*.

5004. Cutter, Fred. (VA Central Research Unit, Los Angeles, CA) **Coming to terms with death: How to face the inevitable with wisdom and dignity.** Chicago, IL: Nelson-Hall, 1974. xii, 307 p. \$8.95.—Presents an analysis of the experience of death, including the causes of nonacceptance as well as possible solutions to the anguish of acceptance. Characteristics of American attitudes toward dying are discussed, and suggestions for developing mature and confident attitudes toward an inevitable experience are presented. (4% p ref)

5005. Denney, Nancy W. (U Kansas) **Classification criteria in middle and old age.** *Developmental Psychology*, 1974(Nov), Vol 10(6), 901-906.—In Exp I, 32 middle-aged and 32 elderly Ss were presented with the Conceptual Styles Test. A  $2 \times 2$  (Age  $\times$  Sex) analysis of variance on the percentage of complementary responses obtained on this test reveals that Age and the Age  $\times$  Sex interaction were significant. The middle-aged men gave significantly fewer complementary responses than the other 3 groups. It is suggested that these results reflect sex differences in the course of cognitive development which may result from the differential experiences and life-styles of adult males and adult females. To investigate the effect of one of the most apparent differences between the experiences of middle-aged men and middle-aged women—occupation—the performance of 10 professional and 10 nonprofessional men and 10 professional and 10 nonprofessional women was compared in Exp II. A  $2 \times 2$  (Sex  $\times$  Type of Occupation) analysis of variance on the percentage of complementary responses given on the Conceptual Styles Test yielded only 1 significant effect. Nonprofessionals gave significantly more complementary responses than professionals. (16 ref)—*Journal abstract.*

5006. Eysenck, Michael W. (U London, Birbeck Coll, England) **Age differences in incidental learning.** *Developmental Psychology*, 1974(Nov), Vol 10(6), 936-941.—Examined the effects of age and of incidental-learning tasks on recall of a categorized word list. Ss were 50 18-30 yr old college students and 50 55-65 yr old teachers. The control groups were instructed to remember the words; incidental-learning groups performed orienting tasks, but were not informed that they would have to recall the words. 2 orienting tasks required that Ss process the meaning of the words; the other 2 orienting tasks did not involve semantic processing. Analysis of the free-recall data indicates that the semantic processing tasks led to much greater recall and organization of recall than the nonsemantic orienting tasks. In recall, there was a significant interaction between age and orienting task, with old Ss only manifesting incidental learning that was inferior to young Ss, whose orienting task involved semantic processing. The findings indicate that the presence or absence of an age-related decrement in incidental learning is predictable from the depth of processing of the incidentally acquired material. (23 ref)—*Journal abstract.*

5007. Fillenbaum, Gerda G. & Maddox, George L. **Work after retirement: An investigation into some psychologically relevant variables.** *Gerontologist*, 1974(Oct), Vol 14(5, Pt 1), 418-424.—Information obtained from a highly select group of 37 healthy, financially secure male university faculty retirees indi-

cates that nearly all worked for pay after retiring. Continued working did not seem to be contingent upon the ready availability of jobs but was related to a personal dislike of retirement, intention to work after that event, active preretirement involvement in work, and the presence of younger friends who were working. It is suggested that work after retirement can be conceptualized as due to a mutually reinforcing interaction among the variables examined. (21 ref)—*Journal abstract.*

5008. Gerontological Society & American Geriatrics Society. (Washington, DC) **Program: 27th Annual Meeting of the Gerontological Society with the American Geriatrics Society, Portland Hilton Hotel, Portland, Oregon, October 28-November 1, 1974.** *Gerontologist*, 1974(Oct), Vol 14(5, Pt 2), 101 p.—Presents the program of events and abstracts of papers presented at the annual meeting of the Gerontological Society in the areas of biological sciences, clinical medicine, psychological and social sciences, and social research, planning, and practice.

5009. Hultsch, David F. & Bortner, Rayman W. (Pennsylvania State U, Div of Individual & Family Studies) **Personal time perspective in adulthood: A time-sequential study.** *Developmental Psychology*, 1974(Nov), Vol 10(6), 835-837.—2 measures of personal time perspective were obtained from 1,247 adults using a time-sequential data collection strategy. 2 cross-sectional studies, separated by 1 yr, were conducted to test for the effects of age and time of measurement. Data analyses yielded significant main effects due to ages for both dependent measures. Main effects due to Time of Measurement, Sex, and all interactions were nonsignificant. The findings suggest that differences in personal time perspective during adulthood are related to age rather than sociocultural change during the year.—*Journal abstract.*

5010. Kalish, Richard A. & Reynolds, David K. (Graduate Theological Union, Berkeley, CA) **Widows (view death): A brief research note.** *Omega: Journal of Death & Dying*, 1974(Sum), Vol 5(2), 187-192.—Interviewed 37 pairs of widows and nonwidows, matched for age, ethnicity, and education, about their expectations and preferences concerning death, funerals, belief in immortality, and appropriate behavior for widows and widowers. The role of widowhood had little or no effect on attitudes about death.

5011. Kinsbourne, Marcel. (Duke U, Medical Ctr, Center for the Study of Aging & Human Development) **Cognitive deficit and the aging brain: A behavioral analysis.** *International Journal of Aging & Human Development*, 1974(Win), Vol 5(1), 41-49.—Cross-sectional comparisons were performed between young and old S groups matched for socioeconomic status and vocabulary score on Raven's Coloured Progressive Matrices, an incomplete figure recognition test (IFR), and a measure of auditory letter span (ALS). The elderly group's performance was inferior on all 3 measures, but least so on the ALS, for which they were able to use their overlearned knowledge of English spelling patterns. Deficit on the unfamiliar "right-hemispheric" IFR was fully accounted for by deficit on Matrices. This loss on a test of cerebrally localizable process (IFR) and on a nonlocalizable test presumably indicative of diffuse

neuronal depletion (Matrices) were comparable in extent, suggesting that basically homogeneous cerebral atrophy in aging equally affects focally and diffusely organized cerebral processes. Where previously acquired "structure" can be invoked (ALS), test performance is better preserved. (41 ref)—*Journal abstract*.

5012. Kogan, Nathan. (New School for Social Research) **Categorizing and conceptualizing styles in younger and older adults.** *Human Development*, 1974, Vol 17(3), 218-230.—Compared the classification behavior of 200 male and female college students with that of 168 healthy, well-educated older males and females (mean age = 71 yrs). Object-sorting and photo-sorting (male and female faces) procedures were employed. On measures of categorizing style—conceptual differentiation and compartmentalization—older adults were, respectively, lower and higher than college students. On measures of conceptualizing style—categorical—inferential, analytic—descriptive, and relational—thematic— younger adults exhibited stronger preferences for the 1st 2, and older adults for the 3rd. 5 content categories for sorting human faces were derived: physical, age, psychological, demographic, and preferential. No systematic age or sex differences for sorting male photos were obtained. For female photos, however, age and sex differences were observed. On the whole, the results fail to confirm other published evidence maintaining that aging is marked by conceptual deficits or a regressed mode of cognitive functioning. (28 ref)—*Journal abstract*.

5013. Levinson, Daniel J. et al. (Yale U) **The psychosocial development of men in early childhood and the mid-life transition.** In D. F. Ricks, A. Thomas & M. Roff (Eds), *Life history research in psychopathology: III*. Minneapolis, MN: University of Minnesota Press, 1974. x, 383 p.

5014. Medvedev, Zhores A. (National Inst for Medical Research, London, England) **Caucasus and Altay longevity: A biological or social problem?** *Gerontologist*, 1974(Oct), Vol 14(5, Pt 1), 381-387.—Despite intensive research, no scientific explanations have been found to account for the exceptional longevity claimed for residents of various regions of the USSR. It is suggested that the extreme longevity claimed for certain groups of Soviet citizens appears to be neither a medical nor a biological problem, but rather a complex social problem which has developed for many social, cultural, traditional, local, and political reasons.

5015. Monk, Abraham & Cryns, Arthur G. (State U New York, School of Social Policy & Community Services, Buffalo) **Predictors of voluntaristic intent among the aged: An area study.** *Gerontologist*, 1974(Oct), Vol 14(5, Pt 1), 425-429.—Investigated the correlative connection between stated interest in community volunteer work and a number of social and demographic variables descriptive of 180 aged individuals in a white, ethnic working-class neighborhood of Buffalo, New York. Cross-tabulation of the questionnaire responses and subsequent multiple regression analysis identified a cluster of 6 attributes which could best predict such voluntaristic intent: age, education, belief in self's capacity to serve others, interest in senior citizen activity, scope of social interests, and home ownership. Because the study was limited to general attitudes, actual participation in volunteer programs or

activities could not be predicted.—*Journal abstract*.

5016. Nowlin, John B. (Duke U, Medical School, Ctr for the Study of Aging & Human Development) **Physical changes in later life and their relationships to mental functioning.** In E. W. Busse & E. Pfeiffer (Eds), *Mental illness in later life*. Washington, DC: American Psychiatric Assn, 1974. vi, 301 p. \$7.

5017. Pfeiffer, Eric. (Duke U, Ctr for the Study of Aging & Human Development) **Sexuality in the aging individual.** *Journal of the American Geriatrics Society*, 1974(Nov), Vol 22(11), 481-484.—Notes that sexual activity may continue to play a significant role in the life of the elderly person. At age 68 about 70% of men still regularly partake in sexual activity, and even at age 78 about 25% are sexually active. For men, the married state is not a necessary factor, whereas for women it makes all the difference. Very few unmarried older women report regular sexual activity because of the unavailability of a sanctioned sexual partner. Sexual expression requires privacy, an aspect of life often neglected for the aged. The physician should take these needs into consideration when counseling or when planning programs to improve the quality of life in the later years.—*Journal abstract*.

5018. Sheley, Joseph F. (U Massachusetts, Amherst) **Mutuality and retirement community success: An interactionist perspective in gerontological research.** *International Journal of Aging & Human Development*, 1974(Win), Vol 5(1), 71-80.—Interviews with 40 male residents of a retirement community indicate that satisfaction with life in such a community is tied to the mutuality of background, life style, and interests operating within the community.

5019. Smith, Anderson D. (Georgia Inst of Technology, School of Psychology) **Response interference with organized recall in the aged.** *Developmental Psychology*, 1974(Nov), Vol 10(6), 867-870.—Examined the effects of adult age on response interference with organized recall, using a total of 185 females in 3 age groups: 20-39, 40-59, and 60-80 yrs. Differential response interference was not found in this experiment. While the effect of response interference was found in all age groups and while age did produce differences in the overall level of recall performance, the Age  $\times$  Response Interference interaction failed to reach significance. Results are discussed in terms of several explanations of response interference both with discrete recall of single items and with organized recall.—*Journal abstract*.

5020. Thompson, Larry W. (Duke U, Medical School) **Psychological changes in later life.** In E. W. Busse & E. Pfeiffer (Eds), *Mental illness in later life*. Washington, DC: American Psychiatric Assn, 1974. vi, 301 p. \$7.

## CULTURAL INFLUENCES AND SOCIAL ISSUES

### Culture & Ethnology & Race Relations & Religion

5021. Bacon, Margaret K. (Rutgers State U, Livingston Coll, New Brunswick) **The dependency-conflict hypothesis and the frequency of drunkenness: Further evidence from a cross-cultural study.** *Quarterly Journal of Studies on Alcohol*, 1974(Sep), Vol 35(3-A), 863-876.

—In a previous cross-cultural study by M. K. Bacon et al (1965), the extent of drinking and drunkenness in 110 preliterate societies correlated negatively with the degree of indulgence in infancy and tolerance of dependent behavior in adulthood and positively with pressures toward achievement and self-reliance in childhood. In a reanalysis of data from 53 societies a combined measure of pressures toward achievement in childhood and diffusion of nurturance (based on the number of adults available to care for the children's dependency needs) correlated positively with frequency of drunkenness. In 38 societies, the association between frequency of drunkenness and diffusion of nurturance, pressures toward achievement in childhood and dependence in adulthood accounted for 46% of the total variance. Findings support the dependency-conflict hypothesis that frequency of drunkenness is related to societal customs that limit the indulgence of dependence in infancy, emphasize demands for achievement in childhood, and limit dependent behavior in adulthood. (24 ref)—*Journal abstract*.

5022. Bahr, Howard M. & Chadwick, Bruce A. (Brigham Young U) **Conservatism, racial intolerance, and attitudes toward racial assimilation among whites and American Indians.** *Journal of Social Psychology*, 1974(Oct), Vol 94(1), 45-56.—Explored the relationship between conservatism and attitudes of racial tolerance and acceptance among 122 native Americans and approximately 356 whites, using the Wilson-Patterson Conservatism Scale. Results show that conservatism was inversely related to educational attainment, directly related to age, somewhat more evident among females than males, and not related to income. Factor analysis revealed 4 readily interpretable dimensions of conservatism among the whites—family and motherhood, religious, racial, and radical counterculture factors—but only 2 clearly interpretable factors among the Indians—religious and radical counterculture factors. The anticipated greater conservatism of the Indians did not appear; their cumulative conservatism scores were comparable to those of whites. There was a racial difference in the relation between conservatism and racial intolerance; among whites the conservatives were most likely to give intolerant responses about Indians, but among Indians there was no relationship between conservatism and antiwhite sentiments. Results suggest that whites with intolerant feelings about Indians do want Indians to "join the mainstream" of American society, but reject the possibility of close association with Indians for their own children.—*Journal abstract*.

5023. Ball, Donald W. (U Victoria, British Columbia, Canada) **What the action is: A cross-cultural approach.** *Journal for the Theory of Social Behaviour*, 1972(Oct), Vol 2(2), 121-143.—Discusses the tendency of persons to deliberately seek out and immerse themselves in situations with an element of risk, uncertainty, gain or loss, and even injury and danger. The literature on decision-making, social psychology, and sociology is reviewed with reference to the relation between action and its sociocultural locations. The hypothesis is offered that the type of action in a sociocultural unit is a function of regularly perceived risk in the environment, and data are presented to support this idea. Campus activism, delin-

quency, and drugs and sex are discussed as social problems explicable in terms of this hypothesis. Thus, risk-taking is seen as one of the factors involved in these problems. (62 ref)—*R. S. Albin*.

5024. Berman, Alan L. (American U, Counseling Ctr) **Belief in afterlife, religion, religiosity and life-threatening experiences.** *Omega: Journal of Death & Dying*, 1974(Sum), Vol 5(2), 127-135.—Administered demographic questionnaire and the Belief in Afterlife Scale to 396 undergraduates. Ss were also asked for estimates of current religiosity and whether they had ever faced an experience which threatened imminent or inevitable death. Findings show that the experience of a death threat had no effect on belief in a life after death. Such a belief was, however, related to an interaction among religion and religious activity. It is concluded that while religious activity does not serve as a defense against an experienced stress reaction at the time of stress, the later recall and report of life-threatening experiences occurs less frequently among religious than nonreligious Ss. (25 ref)—*Journal abstract*.

5025. Brand, Elaine S.; Ruiz, Rene A. & Padilla, Amado M. (Avila Coll) **Ethnic identification and preference: A review.** *Psychological Bulletin*, 1974(Nov), Vol 81(11), 860-890.—A review of the literature reveals that until recently, studies of ethnic identification and preference have usually found a preference for majority-group members by both majority- and minority-group Ss. Results have also shown a concomitant disparaging of minority-group members by Ss. The literature is reviewed by the major methodologies employed in ethnic preference research. These methodologies include the following: attitudes as measured by ranking scales, preferences for photographs or line drawings of individuals from various ethnicities, choices of dolls of varied skin and hair colors, cross-ethnic comparisons on personality assessment devices, analysis of sociometric interactions, observation of intergroup behavior, attitude bias in disguised measures, and measurement of automatic changes. The review also summarizes 9 variables (e.g., S's age and skin color) that appear to influence a respondent's identification and preference. It is concluded that (a) multiple measures of ethnic preference should be obtained from respondents, (b) a host of ethnicities besides whites and blacks should be investigated to determine ethnic specific and universal factors associated with ethnic esteem, and (c) description and/or control should be established for those factors that appear to influence strongly the respondent's ethnic identification and preference. (6 p ref)—*Journal abstract*.

5026. Brislin, Richard W. (East-West Ctr, Honolulu, Hawaii) **The Ponzo illusion: Additional cues, age, orientation and culture.** *Journal of Cross-Cultural Psychology*, 1974(Jun), Vol 5(2), 139-161.—Tested the ecological hypothesis used to explain the Ponzo illusion, which states that because the converging lines indicate distance, there is an unconscious inference that "the top line must be longer since it is further away." 420 3-22 yr old Ss from Guam and Pennsylvania were administered various forms of the Ponzo illusion. Results generally support the ecological hypothesis, especially if the importance of various illusion forms and responses from specific age groups is accepted. The major plausible rival

hypothesis to the ecological explanation—the interpretation of 2-dimensional cues—is also discussed. (27 ref)—*Journal abstract.*

5027. Davidson, Graham R. (U Queensland, St Lucia, Australia) **Linguistic determinants of choice-reaction time among Aborigines and white Australians.** *Journal of Cross-Cultural Psychology*, 1974(Jun), Vol 5(2), 199-211.—30 Aboriginal and 30 white Australian adolescent males (mean age = 15 yrs) classified stimuli along a specifically Aboriginal or a moiety dimension of dual organization and along a color dimension. A  $2 \times 2$  randomized factorial design was used with simple reaction time as the covariate. Results show that Aborigines had significantly greater choice matching-response times (CRTs) on both CRT tasks. A significant Culture  $\times$  Task interaction was found which was in the opposite direction to the suggestion that moiety classification would favor Aborigines in a CRT task. Codability was slightly related to CRT for the white Australian group. (28 ref) *Journal abstract.*

5028. Gluckman, Laurie K. **Transcultural consideration of homosexuality with special reference to the New Zealand Maori.** *Australian & New Zealand Journal of Psychiatry*, 1974(Jun), Vol 8(2), 121-125.—Postulates that homosexuality in both male and female was unknown in pre-European New Zealand but that it has become relatively common with increasing contact with European culture. The reasons for this are discussed, justifying the conclusion that such homosexuality is socially and culturally determined. (22 ref)

5029. Goodman, Felicitas D. (Denison U) **Disturbances in the Apostolic Church: A trance-based upheaval in Yucatán.** In F. D. Goodman, J. H. Henney & E. Pressel, *Trance, healing, and hallucination: Three field studies in religious experience*. New York, NY: John Wiley & Sons, 1974. xxiii, 388 p.—Describes the outbreak of a "crisis cult," events leading up to it, and its aftereffects from the viewpoint of a participant-observer. A new model is proposed to explain the culture change, trance behavior, and supernatural premise elements of the reported phenomena.

5030. Goodman, Felicitas D.; Henney, Jeannette H. & Pressel, Esther. (Denison U) **Trance, healing, and hallucination: Three field studies in religious experience.** New York, NY: John Wiley & Sons, 1974. xxiii, 388 p.

5031. Gorsuch, Richard L. & Aleshire, Daniel. (Texas Christian U, Inst of Behavioral Research) **Christian faith and ethnic prejudice: A review and interpretation of research.** *Journal for the Scientific Study of Religion*, 1974(Sep), Vol 13(3), 281-307.—Studies of the association between Christianity and ethnic prejudice indicate that moderately active church members were prejudiced, but highly active members were as tolerant as nonmembers. The more intrinsically religious, nonfundamentalistic, and theologically discriminating persons were also more tolerant. These conclusions held regardless of when the studies were conducted, from whom the data came, the region where the data were collected, or the type of prejudice studied. It appeared that holding a strong value position which allowed one to stand outside of the value traditions of society at large was crucial in adopting a nonprejudiced position and was typical of both nonreli-

gious and highly religious people. (112 ref)—*Journal abstract.*

5032. Hardy, Alister. (Manchester Coll, Religious Experience Research Unit, Oxford, England) **Anthropology, parapsychology and religion.** *Parapsychology Review*, 1974(Sep-Oct), Vol 5(5), 14-17.—Proposes that primitive religion, rather than being derived from magic or animism as some earlier anthropologists thought, may represent the discovery of an extrasensory power shared among mankind. In giving primitive man strength, religion would encourage him in a way of life with survival value. Based on the anthropological studies of R. R. Marett, it is suggested that the idea of the Holy may be parapsychological in nature. Anthropologists should be open to such possibilities and approach them experimentally.—P. F. Grim.

5033. Henney, Jeannette H. (Capital U) **Spirit-possession belief and trance behavior in two fundamentalist groups in St Vincent.** In F. D. Goodman, J. H. Henney & E. Pressel, *Trance, healing, and hallucination: Three field studies in religious experience*. New York, NY: John Wiley & Sons, 1974. xxiii, 388 p.—Discusses and analyzes phenomena among the Shakers and the Streams of Power, 2 religious cults, and compares them to similar religious groups in the Caribbean.

5034. Jeffries, Vincent & Tygart, Clarence E. (California State U, Northridge) **The influence of theology, denomination, and values upon the positions of clergy on social issues.** *Journal for the Scientific Study of Religion*, 1974(Sep), Vol 13(3), 309-324.—A study of 321 randomly selected pastors of 5 denominations in the Los Angeles metropolitan area revealed that theological position was a better predictor of opinions and activities concerning major social issues than denominational affiliation or extrareligious values. This finding is contrary to B. Johnson's (1967) speculative rejection of the theology as a major source of pastors' political commitments.

5035. Jones, John & Shea, John. (U Papua & New Guinea, Port Moresby) **Conservatism measures in Papua New Guinea.** *Journal of Cross-Cultural Psychology*, 1974(Jun), Vol 5(2), 172-183.—Used a modification of Wilson and Patterson's Conservatism Scale, which uses a "catch-phrase" approach, to 97 university students in Papua New Guinea. Results were compared with data collected in 1968 by Wilson and Patterson in New Zealand. Problems of equating New Zealand and Papua New Guinea political affiliation in an effort to gauge Ss' conservatism led to the use of church attendance and divergent thinking abilities as external criteria. Degree of European contact, rapid social change, and homogeneity of religious experience may help account for the unexpected positive but nonlinear relationship obtained between high divergent thinking and high conservatism scores.—*Journal abstract.*

5036. Klaus, Rudi & Bass, Bernard M. (U Rochester) **Group influence on individual behavior across cultures.** *Journal of Cross-Cultural Psychology*, 1974(Jun), Vol 5(2), 236-246.—Studied cultural differences in the effects of group conformity pressures on individual attitudes and behavior. The responses of managers from 13 different countries who participated in group management training programs around the world were analyzed. Results

indicate that West German and Swiss managers were particularly high in conformist-type response patterns, while British and Austrian managers ranked lowest in conformity among the countries represented. Japanese managers exhibited a complex pattern with a noticeable anticonformist tendency, a finding that has been reported in previous research.—*Journal abstract.*

5037. Korte, Charles. (Vassar Coll) **The role of racial information in the completion of interracial acquaintance chains.** *Journal of Social Psychology*, 1974(Aug), Vol 93(2), 305-306.—C. Korte and S. Milgram (see PA, Vol 44:12489) previously found a high completion rate for acquaintance chains started by whites when the target person was white vs black. Results of the present study rule out the explanation that lower completion rate to blacks was due to lack of information as to the target person's race; in fact, white "starters" reached black targets more readily than white targets.

5038. Kugelmass, Sol; Liebllich, Amia & Bossik, Dorit. (Hebrew U, Jerusalem, Israel) **Patterns of intellectual ability in Jewish and Arab children in Israel.** *Journal of Cross-Cultural Psychology*, 1974(Jun), Vol 5(2), 184-198.—Tested a total of 82 Arab children in kindergarten and Grade 1 on an Arabic translation of the Wechsler Preschool and Primary Scale of Intelligence. The subtest profiles were compared to those of a relevant subsample of the Israeli Jewish normative national sample. The pattern for the Arab rural samples was distinctly different from that of the Jewish ethnic subsamples. These findings, which were based on the mean score analysis, were supplemented by a more extensive analysis based on the total distribution of scores. Correlational configurations of the 2 samples, however, revealed a certain invariance of the structure. The findings are related to those of previous studies. (25 ref)—*Journal abstract.*

5039. Larsen, Knud S. (Oregon State U) **A scale measuring attitudes toward black and white integration.** *Journal of Social Psychology*, 1974(Oct), Vol 94(1), 111-113.—Describes the development of a Likert-type scale measuring attitudes toward black-white integration. 100 items were selected from a larger pool, with the use of criteria for good attitude scale statements. After item analysis, 20 items were retained having part-whole correlations greater or equal to .56. The reliability and validity study showed a corrected split-half correlation coefficient of .85, and moderate validity coefficients.—*Journal abstract.*

5040. Lüscher, Kurt K.; Ritter, Verena & Gross, Peter. **Early child care in Switzerland.** *Early Child Development & Care*, 1973, Vol 3(2, Mono 4), 89-210.—Surveys Switzerland's child-rearing attitudes and practices from a sociological viewpoint. Among topics discussed are the training of child-care workers, the nature of the family, socialization techniques, and current child development research.

5041. May, Gerald G. **The psychodynamics of spirituality.** *Journal of Pastoral Care*, 1974(Jun), Vol 28(2), 84-91.—Clergymen and other psychotherapists have difficulty incorporating spirituality into their work and in dealing openly with it, perhaps because spirituality, considered as a basic human drive, is subject to psychodynamic influences which may be either healthy

or destructive. Evidences of society's need for increased spiritual experience, and "taboo" aspects of spirituality are discussed. Inadequate spiritual training for clergymen is seen as being a result of personal and societal defenses against spirituality. It is suggested that more honest, critical appraisal is needed to lay a groundwork for spiritual development.—*B. Smith.*

5042. Miller, Gary H. & Agnew, Neil. (York U, Counseling & Development Ctr, Downsview, Ontario, Canada) **The Ledermann model of alcohol consumption: Description, implications and assessment.** *Quarterly Journal of Studies on Alcohol*, 1974(Sep), Vol 35(3-A), 877-898.—Examined the mechanics of the S. Ledermann model of the consumption of alcoholic beverages and its adequacy as a descriptive and predictive tool. The model may be useful to approximate consumption in different populations, but it is inadequate to predict changes within 1 population when mean consumption changes. Deficiencies of the model are discussed with statistics from France, Sweden, and Canada. (16 ref)

5043. Muir, Donald E. (U Alabama) **Through the school-house door: Trends in integration attitudes on a deep-South campus during the first decade of desegregation.** *Sociology & Social Research*, 1974(Jan), Vol 58(2), 113-121.—4 surveys of 3,586 white undergraduates' attitudes conducted at 3-yr intervals reflect an increasing acceptance of blacks and approval of desegregation in all areas. While blacks are accepted as political and economic equals, they are not accepted as roommates, social intimates, or dates. Results indicate a rapidly decreasing social distance between races and a rejection of racial roles once the setting has been politically neutralized.—*R. V. Heckel.*

5044. Pressel, Esther. (Colorado State U) **Umbanda trance and possession in São Paulo, Brazil.** In F. D. Goodman, J. H. Henney & E. Pressel, *Trance, healing, and hallucination: Three field studies in religious experience.* New York, NY: John Wiley & Sons, 1974. xxiii, 388 p.—Examines the behavior of individuals who are trance mediums. Case histories are presented and analyzed. An hypothesis is suggested that Umbanda represents a religious innovation related to socioeconomic changes in Brazil during the last 50 yrs.

5045. Pruyser, Paul W. (Menninger Foundation, Topeka, KS) **Between belief and unbelief.** New York, NY: Harper & Row, 1974. xvii, 301 p. \$10.—Presents a phenomenological analysis of religious belief, emphasizing how both religious belief and its rejection are states of alienation based on conflicting views of society. Various existential themes, including mystery, options, fantasy vs reality, and "Providence," are explored in relation to their function as ways of dealing with life themes. (14 p ref)

5046. Ramirez, Manuel & Price-Williams, Douglass R. (U California, Riverside) **Cognitive styles of children of three ethnic groups in the United States.** *Journal of Cross-Cultural Psychology*, 1974(Jun), Vol 5(2), 212-219.—Administered the rod-and-frame test to 60 Anglo-American, 60 Mexican-American, and 60 black 4th graders attending Catholic parochial schools. Results show that blacks and Mexican-Americans scored in a significantly more field-dependent direction than Anglo-Americans. Females in all 3 groups were more field

dependent than males. Results confirm previous findings that members of groups which emphasize group identity and respect for family and religious authority, and which are characterized by shared-function family and friendship groups, tend to be field-dependent in cognitive style. In contrast, members of groups which encourage questioning of convention and an individual identity, and which are characterized by formally organized family and friendship groups, tend to be more field independent.—*Journal abstract.*

5047. Saffady, William. (Wayne State U) **Fears of sexual license during the English Reformation. *History of Childhood Quarterly: The Journal of Psychohistory*, 1973(Sum), Vol 1(1), 89-97.**—Argues that in 16th century England unconscious factors were involved in the resistance to Anabaptists and Sacramentarians which were based on the anxiety provoked by the threat of releasing repressed instincts. (48 ref)

5048. Solnit, Albert A. (Yale U, Child Study Ctr) **A summing up of the Dakar conference: "Care for your children as you wish them to care for your grandchildren."** In E. J. Anthony & C. Koupennik (Eds), *The child in his family: Children at psychiatric risk: III*. New York, NY: John Wiley & Sons, 1974. xxi, 547 p.—Summarizes conference discussions on anthropological theories of family function and structure; world views of urbanization; biochemical cycles and linkages of biogenic amines; the child's resiliency, resources, vulnerabilities, and risks; and an awareness of ever-changing societal and cultural forces and patterns.

5049. Taylor, Donald M. & Jaggi, Vaishna. (McGill U, Montreal, Quebec, Canada) **Ethnocentrism and causal attribution in a south Indian context. *Journal of Cross-Cultural Psychology*, 1974(Jun), Vol 5(2), 162-171.**—30 Hindu adults in India read paragraphs describing socially desirable or undesirable behavior performed by ingroup (Hindu) or outgroup (Muslim) members. Ss were then asked to attribute the behavior to internal or external causes. It was found that Ss made internal attributions when ingroup members performed socially desirable acts and external attributions for undesirable acts. The converse was true for attributions made when the same behavior was performed by Muslims. Results are discussed in terms of the importance of attribution theory principles for studying prejudice and the relationship between attitudes and behavior. (16 ref)—*Journal abstract.*

5050. Trivedi, Harshad R. & Malhotra, Prabha. **Magical significance of perinatal beliefs and practices in rural Delhi. *Indian Journal of Social Work*, 1974(Apr), Vol 35(1), 35-40.**—Presents folk beliefs and practices relating to childbirth, compiled from various agricultural and nonagricultural castes. Both pre- and postnatal customs are included. A theoretical framework is given, as are ways of analyzing some of the trends of the beliefs.

5051. Turnbull, Colin M. (Virginia Commonwealth U) **Normality and tribal society.** In E. J. Anthony & C. Koupennik (Eds), *The child in his family: Children at psychiatric risk: III*. New York, NY: John Wiley & Sons, 1974. xxi, 547 p.—Describes the child-rearing practices of 2 African tribes to illustrate the hypothesis that cultural factors affect a society's concept of normality.

5052. Turner, Barbara F. & Turner, Castellano B. (U Massachusetts, Amherst) **Evaluations of women and men among black and white college students. *Sociological Quarterly*, 1974(Sum), Vol 15(3), 442-456.**—L. Rainwater's 1966 assertion that blacks have low self-evaluations because they receive more negative evaluations from other blacks than whites receive from other whites is challenged here by reference to P. Heiss and S. Owens's 1972 evidence that negative self-evaluation among blacks is limited to work-related traits. Substantial support was found for the major hypotheses that, compared to whites, blacks would report more negative evaluation of "most men" but not of "most women" (since the provider role is traditionally ascribed primarily to men), and that the more negative evaluation of "most men" by blacks would be limited to work-related traits. Data were obtained from 59 black and 82 white freshmen at a large university. (23 ref)—*Journal abstract.*

5053. Waters, John J. James Otis, Jr.: **An ambivalent revolutionary. *History of Childhood Quarterly: The Journal of Psychohistory*, 1973(Sum), Vol 1(1), 142-150.**—Discusses Otis's reactions to authority in childhood and their similarities to his reaction to British rule in the 1760s. (33 ref)

### Social Issues & Social Processes

5054. Abramowitz, Stephen I. (Vanderbilt U, Interuniversity Psychological & Counseling Ctr) **Personality, the sociocultural environment, and student political activism: Toward a field theory of social behavior. *Journal of Psychology*, 1974(Sep), Vol 88(1), 103-112.**—Assessed the suitability of a field-theoretical, social psychological model for understanding student political activism. 95 undergraduates provided information on their political involvements and also on certain personality dispositions and social environments which are implicated in the theoretical literature as conducive to them. Both the individual difference and the sociocultural predictor constellations explained an appreciable amount of variation in the political activity criteria. Evidence was then adduced to support the field-theoretical position that personality and social environment variables account for supplementary rather than overlapping segments of the variation in campus unrest. The results call into question the appropriateness of unidimensional or unidisciplinary approaches to understanding the activism phenomenon and suggest the likely futility of intervention programs based on them. They reinforce previous findings consistent with a field-theoretical explanation of complex social behavior. (29 ref)—*Journal abstract.*

5055. Adamek, Raymond J. (Kent State U) **Abortion, personal freedom, and public policy. *Family Coordinator*, 1974(Oct), Vol 23(4), 411-419.**—Discusses the recent success of the abortion "reform" movement in the US and its relationship to the American value system. A review of the arguments and data pro-abortionists have utilized to establish present policy suggests that this rather extreme solution to personal and social problems has been adopted without adequate evidence as to its necessity, efficacy, or desirability. Some alternate perspectives and solutions are suggested.—*Journal abstract.*

5056. Aldridge, Delores P. (Emory U) **Problems and approaches to black adoptions.** *Family Coordinator*, 1974(Oct), Vol 23(4), 407-410.—Discusses some misconceptions about the adoption of black children and adoptions by black families. It is considered that the real problem is not with the black children or the potential black parents, but rather with agencies in the field of adoption. Social agencies need to devise new and different approaches for becoming more responsive to the needs of black children. Policies and practices of these agencies should be refocused and combined with the reorientation and training of the staff members in the culture of black families. An economic investment in new approaches to adoption is vital.—*Journal abstract.*

5057. Babad, Elisha Y. (Hebrew U Jerusalem, School of Education, Israel) **SES differences in effects of brief social satiation.** *Journal of Psychology*, 1974(Sep), Vol 88(1), 153-164.—2 previous studies which supported a cognitive interpretation of the social deprivation-satiation effect with middle-class children were replicated with lower-class Ss. In Exp I 40 middle-class and 40 lower-class 3rd graders were given a social deprivation or a satiation treatment, followed by a binary discrimination test given either by the same or by another E. In Exp II 74 middle-class and 74 lower-class Ss were given information about their E's "reinforcing habits" prior to the treatment, and both treatment and test were given by the same E. It was found that for middle-class samples, the deprivation-satiation effect was person-specific, not generalizable from one E to another; the informational input caused a deprivation-satiation-like effect and modified the effect of actual treatments on subsequent performance. The lower-class Ss reacted mostly to the most immediate, salient, and concrete aspects of the situation. The intangible reinforcing stimulus word "good" was an effective reinforcer for them, but only a nonsignificant trend toward a deprivation-satiation effect was observed, with no person-specificity. The informational input had no effect on the performance of the lower-class children. (26 ref)—*Journal abstract.*

5058. Bakshis, Robert et al. (Illinois State U) **"Meanings" toward death: A TST strategy.** *Omega: Journal of Death & Dying*, 1974(Sum), Vol 5(2), 161-179.—Describes a new method for operationalizing attitudes toward death using the Twenty Statements Test format. A theoretical rationale and empirical data are presented. Responses to the "What is Death?" question were obtained from 79 nurses. 17 categories were generated from a content analysis of these responses. Coding reliability checks produced substantial agreement. Ss expressed varied and contradictory meanings toward death which included religious and nonreligious as well as favorable and unfavorable attitudes. The strategy appears appropriate for tapping the social, symbolic, and contradictory meanings of death. (38 ref)—*Journal abstract.*

5059. Barlett, Dorothy L.; Drew, Pamela B.; Fahle, Eleanor G. & Watts, William A. (U California, Berkeley) **Public exposure to a presidential campaign appeal.** *Public Opinion Quarterly*, 1974(Sum), Vol 38(2), 264-270.—Examines the hypothesis that during political campaigns people seek information that reinforces their own position and avoid dissonant or challenging information.

Explanations are offered for conflicting data in regard to the hypothesis, and results of a study conducted prior to the 1972 presidential election are reported.

5060. Bejerot, Nils & Maurice-Bejerot, Carol. (Inst Karolinska, Sweden) **[Methods of studying prevalence and incidence of drug abuse.]** (Fren) *Toxicomanies*, 1974(Apr-Jun), Vol 7(2), 123-134.—Briefly describes different methods used to study the frequency of drug abuse and discusses the advantages and disadvantages of each. The detection and interpretation of injection marks is a particularly useful method that can be employed to follow the course of an epidemic. (French summary) (55 ref)

5061. Brody, Eugene B. (U Maryland, Medical School, Baltimore) **Mental health and population control.** *MH*, 1974(Win), Vol 58(1), 12-14.—Proposes that clearly defined Federal science policies need to be integrated with clearly defined Federal responsibility for the public health if adequate and humane answers are to be found for curbing human population growth. Systematic examination of this issue by mental health leaders is urged.

5062. Brown, Don W. (U California, Riverside) **Adolescent attitudes and lawful behavior.** *Public Opinion Quarterly*, 1974(Spr), Vol 38(1), 98-106.—Tested the hypothesis that constrained orientation toward law is a function of individual salience toward law. A stratified sample of 261 adolescents (grades 7-12) responded to a salience toward law scale. Results show high negative correlations between criterion measures of salience toward law and noncompliance with the law, and vice versa. (18 ref)

5063. Brunswick, Ann F. & Tarica, Carol. (Columbia U, School of Public Health) **Drinking and health: A study of urban black adolescents.** *Addictive Diseases*, 1974, Vol 1(1), 21-42.—Data from a representative sample of 659 12-17 yr old black boys and girls indicate that drinkers were more likely to report 16 out of 51 health problems. The linkage between drinking and poor health was most notable among younger boys and older girls. Drinkers worried more and reported more sleep disturbance. In multivariate analysis, smoking was the strongest predictor of drinking for boys, and early pregnancy was the strongest predictor for girls. A combination of life-style behavior, psychosomatic problems, and worries explained 40% of the variance in boys' drinking and 30% in girls' drinking.—*Journal abstract.*

5064. Cairns, Leonard G. & Bochner, Stephen. (U Sydney, NSW, Australia) **Measuring sympathy toward handicapped children with the "lost-letter" technique.** *Australian Journal of Psychology*, 1974(Aug), Vol 26(2), 89-91.—300 stamped and addressed letters were "lost" in public places. The manipulation consisted of varying the addresses on the envelopes, there being 5 experimental and 1 control condition, each with an *n* of 50. In the experimental conditions, the letters were addressed to groups concerned with the welfare of handicapped children, whereas the control was simply the Children's Aid Group. The response rate in 4 of the 5 experimental conditions was greater than in the control condition, thereby providing evidence for the predictive validity of the "lost-letter" technique.—*Journal abstract.*

5065. Carlin, Albert S. & Post, Robin D. (U Washington) **Drug use and achievement.** *International Journal of the Addictions*, 1974, Vol 9(3), 401-410.—Interviewed 226 20-41 yr old Ss about their goals, educational experiences, and current occupational status. Ss were classified according to frequency of marihuana use and extent of experience with other hallucinogenic drugs. Data show that both marihuana use and hallucinogenic experience are inversely related to employment, successful completion of school, and present enrollment in school. Years of education completed varied inversely with the amount of marihuana used and previous psychedelic drug experience. Ss with no previous marihuana experience tended to express more achievement goals and fewer vague or absent goals than Ss who had used marihuana. Goal setting varied as a function of the decision to use drugs rather than the amount of drugs used. Implications for the existence of an "amotivational" syndrome in drug users are discussed.—L. Gorsey.
5066. Chapman, Clyde & Risley, Todd R. (U Kansas) **Anti-litter procedures in an urban high-density area.** *Journal of Applied Behavior Analysis*, 1974(Fal), Vol 7(3), 377-383.—Notes that in urban high-density areas, litter has become an increasingly obvious and pervasive problem. In the present study, repeated measures of the amount of litter on randomly selected yards in an urban low-income housing project were used to evaluate the effectiveness of a series of antilitter procedures directed at the 132 4-13 yr old children residing in the project. Paying children for volume of trash collected resulted in only a small decrease in the number of litter pieces present. Paying them for cleaning assigned yards markedly decreased the level of litter in all sampled yards. Thus, children can be employed to maintain a clean neighborhood in spite of the rapid accumulation of new litter in urban yards.—*Journal abstract.*
5067. Chaubey, Nageshwar P. & Sinha, Durganand. (U Allahabad, India) **Risk-taking and economic development.** *International Review of Applied Psychology*, 1974(Apr), Vol 23(1), 55-61.—Administered to 40 rural Ss Chaubey's (1962) opinion questionnaire, which consists of 8 risky situations in a rural context. Results substantiate the hypothesis of a close association between moderate risk-taking and rapid economic development. In a related study, a close relationship was found between achievement motivation and intermediate risk-taking; the same result has been obtained by others. In developing countries like India, a willingness to accept power, to use new things, to control population, and to take up challenging jobs are the most essential requirements of rapid economic development. However, caution is expressed against generalizing these results.—L. A. Ostlund.
5068. Clark, Terry N. **Community power and decision-making.** *Current Sociology*, 1972, Vol 20(2), 6-56.—Reviews recent trends in the study of community power and decision-making based on references in I. P. Leif's (1972) extensive annotated bibliography (see PA, Vol 53:Issue 2). An important tendency during the past decade has been to see the community in the context of more general theoretical frameworks and not as a closed system. (French summary)
5069. Connor, John W. (California State U, Sacramento) **Acculturation and changing need patterns in Japanese-American and Caucasian-American college students.** *Journal of Social Psychology*, 1974(Aug), Vol 93(2), 293-294.—To assess the degree of acculturation among Japanese-Americans, Edwards Personal Preference Scale scores were compared for Japanese-American college students, Caucasian students, and Edwards's 1952 normative college sample. Results indicate that while some acculturation had taken place among the Japanese-Americans, their scores still expressed a significantly higher need for order, affiliation, abasement, and nurturance and a significantly lower need for intraception, change, and heterosexuality than those of the Caucasian student sample.
5070. Cormier, Dollard. (U Montreal, Quebec, Canada) **[Personal inhibitions in the transfer from cannabis to hard drugs.]** (Fren) *Toxicomanies*, 1974(Apr-Jun), Vol 7(2), 135-145.—Discusses similarities between users of hard drugs and users of soft drugs, such as cannabis, that would facilitate or prevent transfer from one kind of drug to the other. In particular, the social insecurity characteristic of cannabis users seems to inhibit the use of hard drugs. The relevance of the concepts of self-perception and self-actualization is also considered. Soft and hard drug users are not identical and only the more disturbed members of the 1st group turn towards hard drugs. (French summary)—*English summary.*
5071. Cunningham, William H.; Cunningham, Isabella C. & English, Wilke D. (U Texas, Graduate School of Business, Austin) **Sociopsychological characteristics of undergraduate marijuana users.** *Journal of Genetic Psychology*, 1974(Sep), Vol 125(1), 3-12.—Studied 547 undergraduates to determine if marihuana users could be successfully differentiated from nonmarihuana users on the basis of 8 sociopsychological, 10 demographic, and 4 behavioral variables. Results indicate that marihuana smokers were less conservative, more cosmopolitan, more politically discontent, less dogmatic, less status conscious, less socially responsible, and less fundamental than nonsmokers of marihuana. Marihuana smokers also had fathers with higher-status occupations, families with higher social class positions in the community and more expensive homes, and mothers with less outside employment, and were less religiously oriented than nonsmokers. There was a positive relationship between the use of marihuana and the use of amphetamines, barbiturates, hallucinogens, heroin, and cocaine. It is suggested that individuals who have tried marihuana are more likely to experiment with stronger drugs than are individuals who have not tried the drug. (16 ref)—*Journal abstract.*
5072. Davidson, F.; Etienne, M. & Piesset, J. (INSERM, Medico-Social Research Div, Paris, France) **Medico-social survey of 662 drug users (April 1971-May 1972).** *Bulletin on Narcotics*, 1973(Oct-Dec), Vol 25(4), 9-32.—Studied 662 drug users as to their travels abroad, difficulty in contacting a treatment center, changes in drug usage, hospitalizations, suicide attempts, etc.
5073. Davies, Martin. **Social inquiry for the courts: An examination of the current position in England and Wales.** *British Journal of Criminology*, 1974(Jan), Vol 14(1), 18-33.—Argues that the growth of presence

social inquiry reporting has been associated with the concept of individualized sentencing. The use of such reports is seen as one of the most important penal developments of the 20th century, reflecting the increasing involvement of the probation service in the sentencing process. (22 ref)

5074. Erskine, Hazel. **The polls: Fear of violence and crime.** *Public Opinion Quarterly*, 1974(Spr), Vol 38(1), 131-145.—Reviews the 1965-1973 trends in public opinion about crime, social protest, and racial unrest. Data are presented according to geographic region, sex, education, age, family income, religion, political affiliation, size of community, occupation, polling organization, and other variables.

5075. Fillmore, Kaye M. (Rutgers State U, Ctr of Alcohol Studies, New Brunswick) **Drinking and problem drinking in early adulthood and middle age: An exploratory 20-year follow-up study.** *Quarterly Journal of Studies on Alcohol*, 1974(Sep), Vol 35(3-A), 819-840.—Measured problem drinking and the quantity and frequency of drinking in a stratified sample of 109 men and 97 women 20 yrs after they were originally studied as undergraduates. It is concluded that although there is a strong tendency toward moderate drinking with increased age, early problem drinking is significantly associated with the existence of problem drinking 20 yrs later. (15 ref)

5076. Glenn, Norval D.; Ross, Adrean A. & Tully, Judy C. (U Texas, Austin) **Patterns of intergenerational mobility of females through marriage.** *American Sociological Review*, 1974(Oct), Vol 39(5), 683-699.—A comparison, based on data from 4 US national surveys (1966, 1968, 1970, and 1972), of female mobility through marriage with male mobility through occupational attainment indicates (a) no tendency toward hypergamy not explained by the favorable balance of upward over downward mobility among males, (b) a weaker relationship of origin to destination among females, (c) a pronounced male mobility advantage among middle-origin persons, and (d) substantially more downward mobility into the manual-farm class by females than by males. Although data indicate in general that the American status structure is more fluid than the male mobility data alone would indicate, there apparently is a condition of relative stasis among middle-origin females. (25 ref)—*Journal abstract*.

5077. Green, Robert L.; Smith, Gloria S.; Gunnings, Thomas S. & McMillan, Joseph H. (Michigan State U, Coll of Urban Development) **Black athletes: Educational, economic, and political considerations.** *Journal of Non-White Concerns in Personnel & Guidance*, 1974(Oct), Vol 3(1), 38 p.—Discusses the history of black athletic protest, specifically the Big Ten Athletic Conference protest of 1972, the status of black athletes in recent college athletic programs, job and social discrimination against black athletes, and how this discrimination operates against black students in academic and interpersonal relationships. Implications for counseling blacks, the effectiveness of Equal Opportunity Employment and Affirmative Action programs, and data from a survey of black athletes in the Big Ten Conference are also examined.

5078. Greene, Bernard L.; Lee, Ronald R. & Lustig, Noel. (U Illinois, Abraham Lincoln School of Medicine) **Conscious and unconscious factors in marital infidelity.** *Medical Aspects of Human Sexuality*, 1974(Sep), Vol 8(9), 97-105.—Discusses some reasons given by patients for marital infidelity and some possible motivations for their behavior. Psychodynamics of the partner's reactions are also examined. 5 common motives that patients give when asked why they were unfaithful are identified and discussed: sexual frustration, curiosity, feelings of revenge or boredom, and a need for acceptance and recognition from another person. 3 major groups of unconscious motives are also considered: those involving severe psychiatric disturbance, those involving an immature personality, and those associated with neurotic conflicts. Cases are presented to illustrate these motivations, and suggestions for counseling and therapy are noted.—*L. Gorsey*.

5079. Grindstaff, Carl F. (U Western Ontario, London, Canada) **Public attitudes and court dispositions: A comparative analysis.** *Sociology & Social Research*, 1974(Jul), Vol 58(4), 417-426.—Compared attitudes toward sanctions for criminal offenses of 1,000 Canadian Ss with court sentences for personal crimes, property crimes, and crimes without victims. Results indicate that the public provides more severe punishment for crimes than are meted out by courts, suggesting a lack of value consensus between courts and public opinion.—*Journal abstract*.

5080. Grossman, Jan C.; Goldstein, Ronald & Eisenman, Russell. (Philadelphia State Hosp, North Unit, PA) **Undergraduate marijuana and drug use as related to openness to experience.** *Psychiatric Quarterly*, 1974, Vol 48(1), 86-92.—Administered a battery of tests (including the Personal Opinion Survey, the California F Scale, Manifest Anxiety Scale, the Crowne-Marlowe Social Desirability Scale, and an acquiescent response set test) to 316 college students who also reported their use of marihuana and other drugs. All reports and tests were anonymous. With increased frequency of marihuana usage, creativity and adventuresomeness scores increased significantly, while authoritarianism scores decreased significantly. Males were significantly heavier users than females, and Jews were heavier users than Protestants or Catholics. (16 ref)—*Journal abstract*.

5081. Hartnoll, Richard & Mitcheson, Martin. (Drug Research Project, Medical Research Council, London, England) **Attitudes of young people towards drug use.** *Bulletin on Narcotics*, 1973(Apr-Jun), Vol 25(2), 9-24.—Surveys studies of young people's attitudes toward drugs. Among school children a more positive attitude towards amphetamine, the most commonly used drug, is prevalent. However LSD and opiates are named as harmful by school children as well as by other users. Drug users think of themselves as "interesting" people and may look upon drugs as additional "enrichment." Users are seriously misinformed about drugs. Users are more precocious in their behavioral development. In general, the drug culture frowns upon "heavy" use. LSD and cannabis are favored in the "underground" culture and amphetamines are rejected. Drugs are part of modern life, and proper education, by credible authori-

ties, as part of the health curriculum in schools will help reduce drug abuse.—A. S. Kulkarni.

5082. Heimstra, Norman W. & McFarling, Leslie H. (U South Dakota) **Environmental psychology**. Monterey, CA: Brooks/Cole, 1974. 210 p. \$7.50.—Presents an overview of the major concepts, theories, and research concerns in environmental psychology, the relationship between man's behavior and his physical environment. Topics include aspects of the built environment (e.g., buildings, cities, and rooms), behavior and the natural environment, and the environment as a source of threat. (10 p ref)

5083. Heinrich, Hanns C. (Gesamthochschule Siegen, Huttental-Weidenau, W Germany) [Verbal attitudes and actual behavior.] (Germ) *Zeitschrift für Experimentelle und Angewandte Psychologie*, 1974, Vol 21(1), 62-79.—Reviews the literature of attitude research with emphasis on empirical studies that contrast attitudes with actual behavior. Positive and negative correlations between attitudes and behavior are reported with approximately equal frequency in the literature. A number of variables are discussed which could interfere between attitudes and actual behavior. (English and French summaries) (43 ref)—W. J. Koppitz.

5084. Hirose, Hirotada. (U Tokyo, Inst of Journalism, Japan) **The structure of political culture in Japan**. *Japanese Psychological Research*, 1974(May), Vol 16(1), 8-21.—Results of a nationwide survey in Japan were used to examine the structure of political culture. 8 political scales were constructed, and several statistical techniques were applied to the data. 3 dimensions of Japanese political culture were identified—cognition toward the political system, behavioral and affective involvement with politics, and political ins-outs. 5 patterns of individuals in the structure of Japan's political culture were found: cognitive-normal, innovative, normal-somewhat-dissatisfied, conformist, and outsider types. (20 ref)—*Journal abstract*.

5085. Hood, Albert B. & Hodges, Richard T. (U Iowa, Div of Counselor Education) **The effect of a serious crime upon attitudes toward resident hall security**. *Journal of College Student Personnel*, 1974(Sep), Vol 15(5), 352-356.—Administered a questionnaire on residence hall security and security-related behavior (e.g., under what situations do students lock their doors) to 36 male and 38 female undergraduates before and 35 male and 33 undergraduates 2 wks after a brutal campus murder. Data indicate that students perceived the murder as an isolated event with little personal significance or implications. No significant differences in security attitudes and behaviors were found between Ss living in open visitation floors and those living in limited or closed floors or between residents of high and low traffic areas.—L. Gorsey.

5086. Inciardi, James A. & Newman, Sandy C. (U Miami, Medical School) **Adolescent attitudes towards drug use: A cross-sectional view of two generations**. *Addictive Diseases*, 1974, Vol 1(1), 117-130.—Discusses data on attitudes toward drug use obtained from statewide surveys conducted in 1973 with 15,400 persons above 14 yrs of age. Data were analyzed according to 5 specific age groups: 14-17, 18-24, 25-34, 35-49, and over 50 yrs. Data suggest that although contemporary

adolescents exhibit attitudes more liberal than those of society as a whole, somewhat higher proportions of positive orientations toward drug use are reflected by the young adults (18-24 yr olds) of the early 1970s. Statistics on the percentages of agreement-disagreement with 11 statements about drug usage are presented. Consensus estimates indicate that the population as a whole viewed the nonmedical use of drugs in a problematic context, although neither of the younger groups shared true positive consensus of opinion toward the use of drugs.—L. Gorsey.

5087. Inkeles, Alex & Smith, David H. (Stanford U) **Becoming modern: Individual change in six developing countries**. Cambridge, MA: Harvard University Press, 1974. xi, 437 p. \$15.—Conducted extensive interviews with over 6,000 men in 6 countries in an attempt to define what makes men modern and to assess the contribution of man's work experience to making him modern. The research design and sample structure, the development of an overall attitude-value-behavioral scale of modernity, data on the correlates and causes of modernization, and the social significance of individual modernization are discussed. (4½ p ref)

5088. Iyengar, Shanto. (Kansas State U) **Magnifying relationships between attitudinal variables using panel analysis**. *Public Opinion Quarterly*, 1974(Spring), Vol 38(1), 90-97.—Analyzed the advantages of panel research in identifying 2 types of respondents: stayers, who did not change over time, and movers, who changed randomly. Results of the 34-mo study comparing movers and stayers with regard to political criterion measures showed significant correlations between own stand and criterion measures of voting punctuality, age at which party identification took place, and index of political salience.—M. K. Phifer.

5089. Josephson, Eric. (Columbia U, School of Public Health) **Adolescent marijuana use, 1971-1972: Findings from two national surveys**. *Addictive Diseases*, 1974, Vol 1(1), 55-72.—Compared findings from 2 national surveys of 12-17 yr olds, one conducted with 498 Ss in May 1971 and the other conducted with 779 Ss in April 1972. Data show that there was no change between 1971 and 1972 in the proportions of adolescents reporting that they had ever used marihuana (15% in both years). There was also no change in the reported amount of past use. Ss from the West were twice as likely to have tried marihuana as Ss in the South; the West was the only region to have an increase in the proportion of users—from 23% in 1971 to 33% in 1972. Ss 16 and 17 yrs of age were in 1971 10 times and in 1972 7 times as likely to have used the drug as younger Ss (12 and 13 yrs old). Girls reported almost as much marihuana use as boys. More frequent users were more likely to live in metropolitan areas, to be from relatively high income families, and to have used other mood-altering drugs. Detailed data on these patterns and on the use of alcohol and cigarettes are also reported.—L. Gorsey.

5090. Kelley, Jonathan. (Yale U) **The politics of school busing**. *Public Opinion Quarterly*, 1974(Spring), Vol 38(1), 22-39.—Analyzed opinions of 1,352 non-Negro respondents toward school busing. Busing attitudes were correlated with racism, amount of education, geographic

region, socioeconomic status, and political preference. (43 ref)

5091. Kellum, Barbara A. (U Southern California) **Infanticide in England in the later Middle Ages.** *History of Childhood Quarterly: The Journal of Psychohistory*, 1974(Win), Vol 1(3), 367-388.—Examines new evidence on the causes and consequences of infanticide in late medieval England. It is contended that the motivation could not have been economic pressures alone; a widespread infanticidal component may have been present in the medieval personality. (6 p ref)

5092. Kirkpatrick, R. George. (U Oklahoma) **Moral indignation and repressed sexuality: The sociosexual dialectics of antipornography crusades.** *Psychoanalytic Review*, 1974(Spr), Vol 61(1), 141-149.—Conducted structured and unstructured interviews with 85 leaders of antipornography crusades, 51 leaders of civil libertarian opposition to such activity, and 47 members of 2 control groups. Interview data support the hypotheses that antipornography crusaders are predominantly lower-middle-class; that crusaders are more nearly lower-middle-class than the other groups; and that crusaders are more highly suppressive of sexuality, more intolerant of deviant behavior, and more ready to inflict punishment than are comparison groups. Implications relevant to the Freudian-Marxist view of man are alluded to and the consequences for society inferred when the basic human functions of hunger and sex are suppressed. (22 ref)—B. Smith.

5093. Klein, Stanley. (Western Connecticut State U) **The final mystery.** Garden City, NY: Doubleday, 1974. 85 p. \$3.95.—Discusses the meaning of death in ancient times and in different cultures and how researchers, physicians, and surgeons have attempted to prolong life.

5094. Knoke, David. (Indiana U) **A causal synthesis of sociological and psychological models of American voting behavior.** *Social Forces*, 1974(Sep), Vol 53(1), 92-101.—Estimated a path model of the presidential vote involving social variables, party identification, issue orientations, and candidate evaluations using samples of voters from the 1964 ( $N = 1,571$ ) and 1968 ( $N = 1,673$ ) elections. Results show that social effects on voting behavior are channeled almost completely through party identification, which has the largest direct effect on the vote. Indirect effects of party identification through candidate evaluations are considerably larger than through issue orientations. The models for both years reveal similar effects, although issues and candidates were more important determinants of the vote in 1964.—*Journal abstract.*

5095. Knowles, Lyle & Poorkaj, Houshang. (Pepperdine U) **Attitudes and behavior on viewing sexual activities in public places.** *Sociology & Social Research*, 1974(Jan), Vol 58(2), 130-135.—Studied attitudes of 1,644 adults toward viewing sexually explicit activities in public entertainment facilities, and the relationship of these attitudes to the frequency with which the Ss reportedly attended such activities within the previous year. Although a positive association was found between permissiveness and viewing participation, inconsistent behavioral and attitudinal trends appeared with respect to more explicit activities and attendance. (16 ref)—*Journal abstract.*

5096. Kojak, George. (Harborview Community Mental Health Ctr, Group & Individual Treatment Section, Seattle, WA) **The American community in Bangkok, Thailand: A model of social disintegration.** *American Journal of Psychiatry*, 1974(Nov), Vol 131(11), 1229-1233.—Suggests that the high prevalence of psychopathology (as measured by the number of marital problems and emotional problems of adolescents requiring professional care) noted in the American community in Bangkok, Thailand, during 1971-1972 was related to social disintegration. Comparison with a relatively integrated American community in Japan reveals a strikingly lower prevalence of psychopathology.

5097. Langer, William L. (Harvard U) **Infanticide: A historical survey.** *History of Childhood Quarterly: The Journal of Psychohistory*, 1974(Win), Vol 1(3), 353-365.—Traces the history of infanticide as a method of disposing of deformed or sickly infants and of population control. (4 p ref)

5098. Laplante, Jacques. (U Ottawa, Ontario, Canada) **[The use of drugs seen in the light of interaction.]** (Fren) *Toxicomanies*, 1974(Apr-Jun), Vol 7(2), 155-166.—Discusses transcultural studies showing that attitudes toward drug users depend on societal attitudes and customs. An objective approach to this problem would involve comparing the drug user to a normal man and assessing the extent of deviance. A subjective approach is recommended, involving description of the user as a person interacting with those around him. (French summary) (26 ref)—*English summary.*

5099. Lehnen, Robert G. & Koch, Gary G. (U Houston) **Analyzing panel data with uncontrolled attrition.** *Public Opinion Quarterly*, 1974(Spr), Vol 38(1), 40-56.—Analyzed 3-wave panel data collected during the 1968 presidential election campaign in Florida and North Carolina on the basis of partial candidate preference information available from some respondents and complete information obtained from others. A supplemented marginals model based on the general linear approach to categorical data analysis is extended to the situation involving incomplete time data. The final statistical models show no politically significant effects associated with the campaign (time) on the level of citizens' preferences for Hubert Humphrey, Richard Nixon, or George Wallace for 7 race and occupation classifications.—*Journal abstract.*

5100. Lemon, Nigel. (U Sussex, Brighton, England) **Training, personality and attitude as determinants of magistrates' sentencing.** *British Journal of Criminology*, 1974(Jan), Vol 14(1), 34-48.—Studied the sentencing behavior of 33 male and 22 female British magistrates, predominantly middle and upper class. The untrained group (26 Ss) were recently appointed and had about completed Stage 1 of training. The trained group (29 Ss) had completed Stage 2 training and had had at least 1 yr of experience on the bench. During a 2-hr interview each S listened to 3 tape-recorded simulated cases, indicated the sentence in each case, and gave the reasons for imposing it. Measures of the personality factor of concreteness/abstractness, and of attitudes to the law and punishment were also obtained. Results indicate various possible direct and indirect interlocking effects of personality, attitudes, and experience on the sentencing.

ing behavior of magistrates, and the implications of these findings are discussed with special reference to the 1-yr training program for magistrates.—D. R. Evans.

5101. Levenson, Hanna. (Texas A&M U) **Participation in antipollution activities and complexity of judgments about environmental degradation.** *Journal of Social Psychology*, 1974(Oct), Vol 94(1), 147-148.—In 2 studies with 77 sociology students and 96 other adult Ss, C. Hovland and M. Sherif's research (1953) was replicated in investigating the hypotheses that (a) when given a fixed number of categories, people who are more involved in antipollution activities will concentrate their placement of items concerning pollution into a small number of categories and will be highly discriminating in accepting terms at their own end of the scale, and (b) when given an unrestricted number of categories, people who are more involved will sort issue statements into significantly fewer piles than less involved people. Results indicate that Ss spaced their items more evenly over the 11 categories and placed more items in the extreme categories; the 2nd hypothesis was not confirmed.—M. E. Pounsel.

5102. Liska, Allen E. (Central Michigan U) **Attitude-behavior consistency: Reply to Magura.** *American Sociological Review*, 1974(Oct), Vol 39(5), 762-763.—Responds to S. Magura's (see PA, Vol 53:Issue 3) criticisms of the author's suggestions for a classification of attitude-behavior research. Support for the 3 components of the classification is presented, and the forms used to present the various conceptualizations of consistency and interaction in attitude-behavior studies are clarified.

5103. Loftin, Colin & Hill, Robert H. (Brown U) **Regional substructure and homicide: An examination of the Gastil-Hackney thesis.** *American Sociological Review*, 1974(Oct), Vol 39(5), 714-724.—2 studies of regional variation in US homicide rates by S. Hackney (1969) and R. D. Gastil (1971) have been interpreted as verifying the hypothesis that high levels of interpersonal violence which characterize the Southern region result largely from cultural factors independent of situational variables. The present author argues that their estimates are based on poor measurement and are biased in the direction of the culture of violence hypothesis. (29 ref)

5104. Magura, Stephen. (Rutgers State U) **A comment on "attitude-behavior consistency . . ."** *American Sociological Review*, 1974(Oct), Vol 39(5), 761-762.—Considers that A. E. Liska's (see PA, Vol 52:10083) suggestion for a threefold classification of attitude-behavior research is actually composed of only 2 elements, since his consistency and interaction conceptualizations are identical. Liska's interaction model is nothing but an additive model with a negative sign.

5105. Mantell, David M. (Wheeler Affiliates, Plainville, CT) **Doves vs hawks: Guess who had the authoritarian parents?** *Psychology Today*, 1974(Sep), Vol 8(4), 56-62.—Interviewed 25 draft resisters and 25 Green Berets. The resisters came from higher socioeconomic class homes and had better educated parents than the Green Berets. The parents of the Green Berets demanded obedience and compliance while those of the resisters offered rational explanations of actions and views. The Green Berets tended to adopt their parents' views with

little thought while the resisters carefully considered their commitments. Other differences are described which further strengthen the conclusion that the willingness to use violence is a product of an authoritarian home life in childhood.—E. J. Posavac.

5106. Murtagi, P. K. (D. G. Ruparel Coll, Bombay, India) **Attitude change: Impact of training for democracy.** *Indian Journal of Social Work*, 1974(Apr), Vol 35(1), 47-56.—Administered a scale measuring antidemocratic and fascist tendencies, based on the California Fascism Scale, to 25 young adults 20-30 yrs old in a training in democracy program, both before and after training. Among the findings were that antidemocratic tendencies were lower after training. The influence of the training was greatest in reducing militancy, conservatism, and reactionary tendencies, moderate in reducing criminality, violence, and desire to suppress democratic ideas, and lowest in changing unfavorable attitudes towards minorities.—I. W. Kidorf.

5107. Nelson, Stephen D. (U Michigan, Inst for Social Research) **Nature/nurture revisited I: A review of the biological bases of conflict.** *Journal of Conflict Resolution*, 1974(Jun), Vol 18(2), 285-335.—Considers that biologically oriented approaches to the study of human conflict have thus far been limited largely to the study of aggression. A sample of the literature on this topic is reviewed, drawing upon 4 major approaches: comparative psychology, ethology, evolutionary-based theories, and human physiology. More sophisticated relationships between so-called "innate" and "acquired" determinants of behavior are discussed, along with the proper relevance of animal behavior studies for human behavior. Unless contained in a comprehensive theory which includes social and psychological variables, biologically oriented theories (although often valid within their domain) offer at best severely limited and at worst highly misleading explanations of complex social conflicts. A list of several positive contributions of these biological approaches is presented. (5 p ref)—*Journal abstract*.

5108. Nutt, Roberta L. & Sedlacek, William E. (U Maryland, Counseling Ctr) **Freshman sexual attitudes and behavior.** *Journal of College Student Personnel*, 1974(Sep), Vol 15(5), 346-351.—Administered an anonymous questionnaire to 752 college freshmen on sexual behavior and attitudes. Data were analyzed according to sex and whether Ss had had sexual intercourse. Results show less of a gap between behavior and attitudes than in previous studies. Ss who had had sexual experience had more liberal personal and ideal sexual codes and held stronger beliefs that contraceptive availability does not increase promiscuity and that abortions should be available without parental consent than Ss with no sexual experience. Males held more liberal personal and ideal codes, were less likely to know any homosexuals, and were more likely to think that homosexuals need psychological help than females. There were no significant Sex  $\times$  Sexual Experience interactions. Factor analysis yielded 2 factors accounting for 85% of the variance, one which loaded with items dealing with S's sexual identity and the other dealing with sexual codes and personal expectations.—L. Gorsey.

5109. O'Keefe, Timothy. (Florida Technological U) **Sometime allies: The mass media and drug abuse**

education.] (Fren) *Toxicomanies*, 1974(Apr-Jun), Vol 7(2), 91-121.—Discusses the role of mass communication in drug abuse education. The usefulness of mass media in controlling drug abuse and suggestions for more effective use of such approaches are considered. The chief influence of the media appears to be reinforcement of attitudes previously acquired through the other, more persuasive, methods of communication. (French & English summaries) (38 ref)—R. L. Cook.

5110. O'Leary, Virginia E. (Oakland U) **Some attitudinal barriers to occupational aspirations in women.** *Psychological Bulletin*, 1974(Nov), Vol 81(11), 809-826.—Presents a review of the literature on those attitudinal barriers which may interact to inhibit the woman worker from engaging in the kinds of achievement-directed behavior necessary to ensure her promotion into managerial positions. Some of these factors (e.g., societal sex role stereotypes and attitudes toward competency in women) are external to the woman herself but may create barriers to her job-related aspirations. Internal factors include fear of failure, low self-esteem, and role conflict as well as perceived consequences and incentives for engaging in achievement-related behaviors. Implications for further research and application of these findings are discussed. (122 ref)—*Journal abstract*.

5111. Olshavsky, Richard W. & Summers, John O. (Indiana U, Graduate School of Business) **A study of the role of beliefs and intentions in consistency restoration.** *Journal of Consumer Research*, 1974(Jun), Vol 1(1), 63-70.—Studied the relationships among beliefs, knowledge, intentions, and behavior of 108 undergraduate and graduate cigarette smokers. Ss were administered a 3-part questionnaire: Section 1 contained 103 beliefs which could serve as reasons for continued smoking; Section 2 consisted of 25 questions on various characteristics of the smoker, his smoking pattern, and his future intentions regarding smoking; and Section 3 tested the Ss' knowledge of the specific health dangers of cigarette smoking. Results suggest that consistency was restored by stating an intention to quit or by espousing beliefs, some of which evidenced factual or reasoning distortions. (19 ref)—*Journal abstract*.

5112. Osborne, J. Grayson; Powers, Richard B. & Anderson, Emmett G. (Utah State U of Agriculture & Applied Science) **A lottery to stop littering.** *Psychology Today*, 1974(Aug), Vol 8(3), 65-66.—Compared the effectiveness of moral exhortations against littering with 2 incentive programs: (a) payment of \$.25 per filled litter bag and (b) one chance per filled litter bag to win \$20. While only .4% of the visitors to the experimental site participated in the programs, both programs significantly decreased the litter. The lottery approach is cheaper than the payment plan, is easily administered, and could help keep parks clean inexpensively.—E. J. Posavac.

5113. Pierce, Charles H. & Risley, Todd R. (U Waterloo, Faculty of Human Kinetics & Leisure Studies, Ontario, Canada) **Recreation as a reinforcer: Increasing membership and decreasing disruption in an urban recreation center.** *Journal of Applied Behavior Analysis*, 1974(Fal), Vol 7(3), 403-411.—It is presumed that recreation activities have a variety of functions for people, from tension reduction to citizenship development; however, a recreation activity's most empirically

obvious function is as a reinforcer. The present 2 experiments with black 7-25 yr olds demonstrate how 2 recurrent problems of urban recreation programs—recruitment of members and reduction of disruptive behaviors within the program—can be handled simply by contingently adjusting the amount of time the recreation activities are available. When extra time in the recreation center was provided to those youths who brought new members, dramatic increases in membership were achieved. When the closing time for each evening's recreation program was publicly moved forward by a few minutes for each offense, disruptive behaviors were nearly eliminated. It is concluded that recreation used as a reinforcer can improve the basic operation of a recreation center and might similarly enhance other presumed and desired functions of recreation. (21 ref)—*Journal abstract*.

5114. Pizer, Stuart A. & Travers, Jeffrey R. (Harvard U) **Psychology and social change.** New York, NY: McGraw-Hill, 1975. ix, 180 p. \$4.95.—Presents a discussion of the processes and effects of social change in individuals, small groups, institutions (specifically, prisons and mental hospitals), and society (emphasizing contemporary socialization practices and their effects on children). (7½ p ref)

5115. Plant, Martin A. & Reeves, Charles E. (U Southampton, England) **The group dynamics of becoming a drug taker.** *Interpersonal Development*, 1973-1974(Aug), Vol 4(2), 99-106.—2 independent British studies examined the group dynamics of drug use in 2 geographical areas. The 2 respondent samples of 122 and 200 Ss, respectively, were located by a nonrandom method called "snowballing." Many of those interviewed were young, unmarried, and living away from their parental homes. Some were females, and most had used several types of drugs. Evidence indicates that most of those observed and interviewed became drug takers through group processes (i.e., by peer pressure and the encouragement of close associates) rather than as a result of individual pathology. Users became drug takers as a positive affirmation of values and behavior. Again, as influenced by group forces and social roles, membership of drug-taking coteries was often temporary or sporadic. (15 ref)—*Journal abstract*.

5116. Podmore, David & Chaney, David. (U Aston, Management Ctr, Birmingham, England) **Educational experience as an influence on "modern" and "traditional" attitudes: Some evidence from Hong Kong.** *Journal of Social Psychology*, 1974(Oct), Vol 94(1), 139-140.—On 11 attitude statements, it was hypothesized that young people in Hong Kong with (a) some secondary education would be relatively "modern" compared with those without secondary education, (b) some higher education would be relatively "modern" compared with those without higher education, and (c) an education exclusively in Anglo-Chinese schools would be relatively "modern" compared with those with an education exclusively in Chinese schools. Results confirm hypotheses.

5117. Rokeach, Milton. (Washington State U) **Change and stability in American value systems, 1968-1971.** *Public Opinion Quarterly*, 1974(Sum), Vol 38(2), 222-238.—Employed the Rokeach Value Survey to measure the

values in an area probability sample of 2,839 adult Americans over the 3-yr period 1968-1971. Most values remained stable, but some underwent significant change. Increasing in importance were values of world peace, beauty, equality, mature love, and a logical approach to problem solving. Declining in importance were the values of a comfortable life, personal accomplishment, family security, social recognition, and cleanliness. To determine whether the changes were manifested in all segments of American society, the value rankings were broken down on the basis of sex, race, income, education and age. (19 ref)—*M. K. Phifer.*

5118. Rosen, R. A.; Werley, H. H.; Ager, J. W. & Shea, F. P. (Wayne State U) **Health professionals' attitudes toward abortion.** *Public Opinion Quarterly*, 1974(Sum), Vol 38(2), 159-173.—Presents results of a 1971 survey of attitudes toward abortion of 20,000 health professionals. Medical students and social work professionals were most favorable toward abortion; nursing faculty members and Catholic health professionals were least favorable. The chief reason given for favoring abortion was protection of the health of the mother; those not in favor stressed the importance of preserving life after conception.—*M. K. Phifer.*

5119. Rosenberg, Janis S.; Kasl, Stanislav V. & Berberian, Rosalie M. (Yale U) **Sex differences in adolescent drug use: Recent trends.** *Addictive Diseases*, 1974, Vol 1(1), 73-96.—Identified sex differences in preferred illicit drugs and trends in use over time for large samples of junior and senior high school students ( $N = 8,700$ ). Current use and lifetime prevalence were anonymously reported by 2 comparable samples 1 yr apart. Between survey years the number of females who "ever used" a drug increased significantly for 9 out of 11 drug categories while the number of males increased in only 3 categories. "Current" usage remained fairly stable for both sexes. Although the females' overall use was more similar to the males' in 1971-1972 than in 1970-1971, the more recent data suggest the following preferences for certain drugs by sex: (a) More males than females had either "ever used" or were current users of alcohol, marihuana, hashish, glue, and heroin. (b) More females were current users of amphetamines and barbiturates. Variations due to grade in school, race, and school type are also reported. (25 ref)—*Journal abstract.*

5120. Ruitenbeek, Hendrik M. **The new sexuality.** New York, NY: New Viewpoints, 1974. 174 p. \$10.—Traces changing attitudes toward sexuality from Victorian times to the present. The idea that the so-called "perversions" belong to the wide variety of legitimate sexual experiences, the weakened role of the male in the American family, and the need for more research on sexuality and sexual behavior are discussed. (11 p ref)

5121. Sanders, Mark; Gustanski, Jerry & Lawton, Mike. (California State U, Northridge) **Effect of ambient illumination on noise level of groups.** *Journal of Applied Psychology*, 1974(Aug), Vol 59(4), 527-528.—Varied the ambient illumination level in a natural setting. Unobtrusive measures of the noise produced by groups of people gathering in the area revealed a significant ( $p < .001$ ) reduction in noise under the low-illumination condition.

5122. Schonberg, William B. (Muskingum Coll) **Modification of attitudes of college students over time:**

1923-1970. *Journal of Genetic Psychology*, 1974(Sep), Vol 125(1), 107-117.—Reports results of the 6th administration of the Pressey X-O Test (1927, Form B) to students at a midwestern university. This administration was designed to measure the effects that cultural events have had on modifying attitudes regarding wrongs, worries, and interests of college students from 1962 to 1970. The increasing liberalization in terms of "wrongs" that earlier investigators found continued to prevail, primarily for the younger classes. Also prevalent was the decreasing number of words marked as "wrongs" from freshman to senior year. Unlike earlier studies using this test, there was a consistent increase in the average number of items worried about for all of the 1970 groups. A downward trend was also observed from freshman to senior year. It is suggested that today's college students are more accepting regarding personal shortcomings, while at the same time are more demanding of society as a whole. They also felt more helpless and lonely than other generations tested and were more fearful of the actions of others.—*Journal abstract.*

5123. Schubert, Glendon. (U Hawaii) **The judicial mind revisited: Psychometric analysis of Supreme Court ideology.** New York, NY: Oxford University Press, 1974. xv, 183 p. \$9(cloth), \$4.95(paper).—Presents an analysis of policy development by the US Supreme Court from 1946 to 1969 in terms of the similarities, continuities, and differences in policies of the individual judges. Detailed comparisons of statistical analysis procedures (principal components, oblique factor, and smallest space analyses) for the same data matrices are presented, along with a proposed theory of political ideology based on psychological concepts, and representations of judicial ideal-points derived from multivariate computer analyses in a set of physical (Euclidean) models.

5124. Segal, Bernard. (Murray State U) **Drug use and fantasy processes: Criterion for prediction of potential users.** *International Journal of the Addictions*, 1974, Vol 9(3), 475-480.—Attempted to predict drug use by using a set of 14 predictor variables, derived from responses to B. Segal and G. Feger's Drug Use Survey and Imaginal Process Inventory, against 2 discrete criteria—ever used vs never used drugs. Ss were 330 undergraduates, 185 of whom had never used drugs and 145 who reported the use of drugs 1 or more times. Significant differences were found between the 2 groups on all 14 variables. Drug users revealed a greater frequency of daydreaming, frightened reactions to daydreams, visual imagery and thinking about the past in daydreams, curiosity in impersonal-mechanical events, and a greater interest in talking about fantasies. Nondrug users showed fewer of these tendencies, but reported more hostile daydreams and more daydreams dealing with interpersonal events. An analysis of hits and misses obtained by the discriminant equations indicated that 129 (70%) of the nondrug users were correctly predicted as to group membership.—*L. Gorsey.*

5125. Smart, Reginald G. & Whitehead, Paul C. (Addiction Research Foundation, Toronto, Ontario, Canada) **The uses of an epidemiology of drug use: The Canadian scene.** *International Journal of the Addictions*, 1974, Vol 9(3), 373-388.—Presents a review of the uses and findings of epidemiological studies of Canadian

drug use patterns. 6 purposes of epidemiological studies are identified: (a) to diagnose the health of the community, (b) to identify the workings of health services, (c) to determine the individual risks, (d) to depict the clinical picture and natural history of a medical problem, (e) to identify certain syndromes, and (f) to search for causes. Findings from studies conducted for each of these purposes are reviewed, and methodological issues are discussed. (40 ref)—*L. Gorsey.*

5126. Smart, Reginald G. & Whitehead, Paul C. **The prevention of drug abuse by lowering per capita consumption: Distributions of consumption in samples of Canadian adults and British university students.** *Bulletin on Narcotics*, 1973(Oct-Dec), Vol 25(4), 49-55.

5127. Smith, Thomas S. (U Rochester) **Aestheticism and social structure: Style and social network in the dandy life.** *American Sociological Review*, 1974(Oct), Vol 39(5), 725-743.—Discusses the dimensions of social aestheticism as part of a case study of the Regency milieu of Beau Brummell, the main figure of the dandy movement. To account for this pattern, the relationship between style and social structure is treated in terms of a theory of structural crystallization and decrystallization. (49 ref)

5128. Sorrentino, Richard M. & Vidmar, Neil. (U Western Ontario, London, Canada) **Impact of events: Short- vs. long-term effects of a crisis.** *Public Opinion Quarterly*, 1974(Sum), Vol 38(2), 271-279.—Examined short- and long-term effects of sudden, unexpected crisis events on public opinion. A 4-mo survey was conducted after a Canadian political crisis in 1970. Results indicate that (a) no conclusions regarding long-term effects of an event can be drawn unless long-term surveys are conducted, (b) opinions given during a crisis may not reflect underlying attitudes, and (c) variables such as sample fluctuation and extraneous events may influence the results.—*M. K. Phifer.*

5129. Souleff, M. I. (Cairo U, Arab Republic of Egypt) **Cannabis ideology: A study of opinions and beliefs centering around cannabis consumption.** *Bulletin on Narcotics*, 1973(Oct-Dec), Vol 25(4), 33-38.

5130. Strickland, Charles. (Emory U) **A transcendentalist father: The child-rearing practices of Bronson Alcott.** *History of Childhood Quarterly: The Journal of Psychohistory*, 1973(Sum), Vol 1(1), 4-51.—Discusses the educational theories of Bronson Alcott and their application to the rearing of Anna and Louisa May. (175 ref)

5131. Thompson, Kenrick S.; Clarke, Alfred C. & Dinitz, Simon. (Ohio State U) **Reactions to My-Lai: A visual-verbal comparison.** *Sociology & Social Research*, 1974(Jan), Vol 58(2), 122-129.—Contrasted the impact of photographic imagery with descriptive paragraphs in communicating information on the killing of civilians at My-Lai. Visual imagery produced more negative reactions. Among the 947, Ss Reserve Officer Training Corps respondents were less critical, except those Ss who viewed photographs who were more critical. Sex differences in judgments were also observed.—*R. V. Heckel.*

5132. Topper, Martin D. (Southern Methodist U) **Drinking patterns, culture change, sociability and Navajo "Adolescents."** *Addictive Diseases*, 1974, Vol 1(1), 97-116.—Discusses social and economic factors which account for considerable changes evident in

Navajo Indian drinking patterns since 1960. Many of these changes have occurred among young adults and adolescents. Drinking changes appear to have been caused by changes in agency towns on the reservation which occurred because of long-term developments in the reservation economy stemming from the 1920s, and from sharp increases in the amount of spending by all levels of government and private industry on the reservation. The cultural conflict between Navajo and white societies and between the young people and their parents are thought to account for many of the frustrations and pressures expressed in drinking. (24 ref)—*L. Gorsey.*

5133. Ulrich, Roger E. (Western Michigan U) **Toward experimental living.** *Behavior Modification Monographs*, 1973, Vol 2(1), 75 p.—Describes an experimental community established in Kalamazoo, Michigan, in 1968. Its negative and positive aspects are discussed and compared with conventional society. A questionnaire study among community members on such factors as the ownership of property and the sharing of duties is reported. The formation of cliques, stratification of the community, and various practical problems are discussed. Faults of the initial effort are summarized. Experiments with alternative life-styles are continuing.—*R. Hall.*

5134. Unger, Rhoda & Raymond, Beth. (Montclair State Coll) **External criteria as predictors of values: The importance of race and attire.** *Journal of Social Psychology*, 1974(Aug), Vol 93(2), 295-296.—To determine whether the appearance of youth reflects their value system, the Rokeach Value Survey was given to a total of 30 black and white young men classified as conventional or deviant on the basis of attire and hairstyle. Results show that appearance was related to value systems, although value differences occurred more as a function of race than attire.

5135. Veevers, J. E. (U Western Ontario, London, Canada) **Voluntary childlessness and social policy: An alternative view.** *Family Coordinator*, 1974(Oct), Vol 23(4), 397-406.—A review of research on voluntary childlessness suggests that there are at least 3 kinds of situations wherein social policies are formulated and enacted: the relationship between citizens and politicians in which pronatalist policies are expounded, the relationship between clients and professional counselors in which parenthood is advocated, and the relationship between patients and physicians in which access to fertility control is restricted. Involuntary parenthood contributes to population problems and may have deleterious consequences for the mental health of both parent and child. Some suggestions are outlined for counteracting pronatalist policies with alternative strategies for manipulating fertility decision-making. (37 ref)—*Journal abstract.*

5136. Wagner, Nathaniel N. (Ed.). (U Washington) **Perspectives on human sexuality: Psychological, social and cultural research findings.** New York, NY: Behavioral Publications, 1974. x, 517 p. \$14.95(cloth), \$6.95(paper).—Presents a collection of 23 empirical and discussion papers on sex differences and the development of sexuality, psychological factors in sexual behavior, cross-cultural perspectives on sexual behavior,

and sexual behavior in various populations (e.g., pregnant women and the elderly).

5137. Weiss, Carol H. (Columbia U, Bureau of Applied Social Research) **Where politics and evaluation research meet.** *Evaluation*, 1973, Vol 1(3), 37-45.—Describes constraints on program evaluation research arising from its political context. Typical differences in viewpoints between decisionmakers and researchers are discussed, and the implicit political attitude of evaluation research itself is analyzed. Several specific proposals for reform are offered.

5138. WHO Expert Committee on Drug Dependence. (Geneva, Switzerland) **WHO Expert Committee on Drug Dependence: Report.** *World Health Organization, Technical Report Series*, 1974, No 551, 89 p.—Presents the proceedings of the 1973 meeting of the World Health Organization (WHO) Expert Committee on Drug Dependence. Topics include the types of work performed by international bodies concerned with drug dependence, methods of prevention of problems associated with drug use, and recommendations for the international control of individual drugs.

5139. Wilson, Glenn D. & Lee, Hyun Soo. (Inst of Psychiatry, London, England) **Social attitude patterns in Korea.** *Journal of Social Psychology*, 1974(Oct), Vol 94(1), 27-30.—Investigated the structure of social attitude patterns of 356 Koreans and examined the appropriateness of the Wilson-Patterson Conservatism Scale to a non-European population. Principal components analysis revealed a general factor of Conservatism similar to that identified in various European cultures, although slightly diminished in importance. The subfactor pattern was sufficiently similar to previous results to allow meaningful scoring according to the standard scales. Low occupational status was associated with conservative attitudes of 4 major kinds—militarism—punitiveness, antihedonism, ethnocentrism, and religiosity. Females were more religious than males but less ethnocentric. Results confirm the universality of social attitude patterns and their associations with demographic variables.—*Journal abstract*.

5140. Winett, Richard A. (U Kentucky) **Behavior modification and social change.** *Professional Psychology*, 1974(Aug), Vol 5(3), 244-250.—Describes behavior modification techniques such as contingency systems, token economies, and behavioral analyses that can be effective instruments of social change. Practical applications are proposed for regulation of natural resources, traffic problems, effective school integration, environmental design, and study of comparative economies. A methodology for studying programs on the community level is proposed, with sequential rather than concurrent implementation of social programs providing the necessary multiple-baseline design. It is noted that such programs must be under citizen control to avoid possibility of coercion. (41 ref)—C. Wright.

5141. Yacenda, John A. (California State U, San Jose) **Knowledge and attitudes of college students about venereal disease and its prevention.** *Health Service Reports*, 1974(Mar), Vol 89(2), 170-176.—Developed a questionnaire on venereal disease (VD) and administered it to 156 men and 136 women undergraduates. The chief source of information about VD for this sample

appeared to have been the schools, along with various channels of self-learning (newspapers, radio, pamphlets, etc). Respondents who had had VD had considerable knowledge concerning it, but were confused about specific later complications. Divergent opinions about prevention and preventive methods were expressed, depending on sexual experience, current sexual activity, sex group, and knowledge of or experience with the disease. Results are given in detail, and the implications for VD education, clinics, and prevention programs are discussed. (16 ref)—R. S. Albin.

5142. Yorburg, Betty. (City Coll, City U New York) **Psychoanalysis and Women's Liberation.** *Psychoanalytic Review*, 1974(Spr), Vol 61(1), 71-77.—Examines psychoanalytic theories of penis envy and womb envy within the social context of the contemporary women's liberation movement. A Freudian theory of sexuality is seen to develop within the context of culture and under the influence of ideology and economic need.

5143. Zanna, Mark P. & Del Vecchio, Steven M. (Princeton U) **Viewer's political orientation and the appropriateness of TV newscaster behavior.** *Journal of Social Psychology*, 1974(Aug), Vol 93(2), 311-312.—Attempted to delineate the role of the TV newscaster from the viewers' perspective and to determine whether viewers' political orientations affect their definitions. Results show that liberals perceived criticizing and calling for change of governmental policy as more appropriate for newscasters than did conservatives. The impact on results of having a conservative administration in office is considered.

## SOCIAL BEHAVIOR AND INTERPERSONAL PROCESSES

5144. Argyle, Michael & Little, Brian R. (U Oxford, England) **Do personality traits apply to social behavior?** *Journal for the Theory of Social Behavior*, 1972(Apr), Vol 2(1), 1-35.—Describes theories of social behavior as they apply to persons vs situations and the variability between and among individuals. Personality is discussed as a constant pattern of behavior, as trait dispositions, as a person's cognitive system, as a series of unrelated stimulus-response links, and as the sum of role performances. The evidence is reviewed on whether or not social behavior can be usefully understood in terms of traits. The practice of ascribing characteristics such as assertiveness, sociability, hostility, etc, to an individual instead of to a sample of his behavior is questioned. The various models of personality are discussed from this viewpoint. (57 ref)—R. S. Albin.

5145. Middlebrook, Patricia N. (Central Connecticut State Coll) **Social psychology and modern life.** New York, NY: Alfred A. Knopf, 1974. xi, 626 p.—Presents a textbook in social psychology aimed at giving a research-oriented approach to contemporary, real-life problems. Among the topics included are social determinants of the self, personal experience and attitude formation, communication and social contact, aggression and social learning, altruism, patterns of interaction, and group functioning. (36 p ref)

5146. Rogers, Rosemarie. (Tufts U, Fletcher School of Law & Diplomacy) **Normative aspects of leisure time behavior in the Soviet Union.** *Sociology & Social Research*, 1974(Jul), Vol 58(4), 369-379.—Used an analysis of research reports by Soviet sociologists to identify norms on leisure behavior in the USSR. Preferred activities included reading, theater, concerts, literature readings, exhibits, museums and sports or art activities. Less popular were radio, TV, and movies. There appears to be recognition of what ought to be watched on TV, although there is some suggestion that, as in the US, actual behavior may not conform to this awareness. (22 ref)—R. V. Heckel.

5147. Saltzstein, Herbert D.; Klausner, Alene & Schiavo, R. Steven. (Herbert H. Lehman Coll, City U New York) **Social influence on perceptual judgments and responses.** *Journal of Social Psychology*, 1974(Oct), Vol 94(1), 123-135.—Tested the hypothesis that social modification of perceptual processes has occurred when the original social influence effect transfers to a different task, with a different E and in the absence of the influence agents. Such transfer was demonstrated with cross-modal-matching tasks. 41 female Ss produced relative magnitudes in the response modality to match relative magnitude in the stimulus modality. It was the judged distances between stimuli which were influenced. The original and transfer tasks shared the same stimulus modality (heaviness of weights) but differed in the response modality (duration of a tone and visual length). The transfer across response modalities suggests that it was the judgmental process rather than the overt response habit which was modified.—*Journal abstract*.

5148. Schoner, Bertram; Rose, Gerald L. & Hoyt, G. C. (Simon Fraser U, Burnaby, British Columbia, Canada) **Quality of decisions: Individuals versus real and synthetic groups.** *Journal of Applied Psychology*, 1974(Aug), Vol 59(4), 424-432.—Compared the quality of decisions on 3 economic problems for individuals, 2 forms of real 5-person groups, and 3 synthetic group-decision rules. A total of 185 undergraduates first made decisions as individuals or as group members and then participated in the opposite condition. Real groups with no previous exposure to the problems made better decisions than did groups whose members had previously made individual decisions on the same tasks, and made decisions superior to a plurality synthetic decision rule, but inferior to the "best man" or I. Lorge and N. Solomon's Model A rule (1955). Both types of real groups outperformed individuals. The relationship between decision quality and riskiness of decision alternatives varied in the 3 decision tasks. Real groups with no prior exposure to the task responded to the suggested risk norm more appropriately than did other decision-making units. (22 ref)—*Journal abstract*.

5149. Shotter, John. (U Nottingham, England) **Prolegomena to an understanding of play.** *Journal for the Theory of Social Behaviour*, 1973(Apr), Vol 3(1), 47-89.—Defines the activity called "play" and elucidates it as a concept. A framework of philosophical thought about man within which play is intelligible is provided. The classical stimulus-response theory of play is examined. The importance of rule-following as a part of human behavior is noted. It is concluded that whether an

activity is play or not depends on a retrospective evaluation i.e., on whether that activity is thought necessary to the conduct of life or not. Forms of play, games, play-therapy, and animal play are discussed. (47 ref)—R. S. Albin.

5150. Sutcliffe, Claud R. (U of the South) **Eliminating the biasing effects of social distance in cross-cultural survey research projects.** *Journal of Social Psychology*, 1974(Oct), Vol 94(1), 141-142.—Tested the hypothesis that the presence of an outside O in an interview would not lead to interview bias. Results of an interview with Arab peasants during which an American professor was present confirm the hypothesis.

5151. Watkins, Charles E. (U Texas, Austin) **An analytic model of conflict.** *Speech Monographs*, 1974(Mar), Vol 41(1), 1-5.—Presents a symbol set and mathematical notation for the representation of the terms of conflict theory ("message," "promise," "threat," etc) within an analytical model.

5152. Wheaton, Blair. (U Wisconsin, Madison) **Interpersonal conflict and cohesiveness in dyadic relationships.** *Sociometry*, 1974(Sep), Vol 37(3), 328-348.—Attempted to identify types and sources of conflict to illustrate how conflict can have both positive and negative effects on group cohesiveness. 2 types of interpersonal conflict, principled and communal (depending on the state of an assumed consensus over basic principles), and 2 sources of issues of conflict, internal and external, were studied using 102 female undergraduate dyads (roommates). Ss completed a questionnaire containing items from Seashore's Group Cohesiveness Index and 30 issues for which S gave her own opinion (agree-disagree on a 9-point scale) and estimated her roommate's opinion. Results suggest that principled conflict has a negative effect on cohesiveness and that communal conflict has a positive effect, producing higher levels of cohesiveness if there is not conflict at all. The predicted intensifying effect of the use of issues internal to a relationship did not generalize to both types, however, suggesting differences between principled and communal conflict. (15 ref)—*Journal abstract*.

### Group Dynamics & Interpersonal Communication

5153. Alcock, James E. (McMaster U, Hamilton, Ontario, Canada) **Cooperation, competition, and the effects of time pressure in Canada and India.** *Journal of Conflict Resolution*, 1974(Jun), Vol 18(2), 171-197.—Studied the effects of time limitations on bargaining behavior in 3 experiments with 20 male and 20 female dyads of Canadian undergraduates (Exp I), 20 male and 18 female dyads of Indian undergraduates (Exp II), and 24 dyads of Canadian male undergraduates (Exp III). Findings indicate that Canadian males reacted to time limits imposed by one of the bargainers in a manner consistent with the way North American males typically react to threat—by becoming very competitive and resisting yielding. When the time limits were imposed by E, however, this same group reacted cooperatively. Canadian females and Indians of both sexes were all relatively cooperative, regardless of the source of time limitation. Indian females, however, were more passive than the other groups. (37 ref)—*Journal abstract*.

5154. Alevy, Daniel et al. (Yale U) **Rationale, research, and role relations in the Stirling workshop.** *Journal of Conflict Resolution*, 1974(Jun), Vol 18(2), 276-284.—Criticisms of theory, design, and research connected with a workshop involving Catholics and Protestants from Belfast are assessed by the organizers and consultants responsible for the project. Differences in role and commitment are advanced as partial explanations for divergent assessments of the workshop.

5155. Altman, Irwin. (U Utah) **Reciprocity of interpersonal exchange.** *Journal for the Theory of Social Behaviour*, 1973(Oct), Vol 3(2), 249-261.—Discusses, as a central issue in the development of interpersonal relationships, the process by which people reciprocally reveal information and feelings to one another. The empirical and theoretical literature is reviewed, and a conceptual framework of the reciprocity phenomenon is proposed. Factors hypothesized to affect level of reciprocity include (a) stage of a social relationship, (b) level of topical intimacy, (c) situational considerations such as degree of commitment to a social relationship, and (d) personal and group composition factors. Further research is needed to analyze the underlying mechanisms, and to study shifts in reciprocity as a function of different antecedent conditions. (27 ref)—R. S. Albin.

5156. Barthol, Richard P. & Berry, Lilly. (U California, Los Angeles) **OB strikes out OD: An application of organization development in sports.** *Interpersonal Development*, 1973-1974(Aug), Vol 4(2), 85-98.—Describes the testing of an Organizational Development (OD) model with a college baseball team. Some suggested changes in the game violated Organized Baseball (OB) traditions and were rejected, but open communication and decision-making in T groups and meetings were viewed as personally valuable.

5157. Boehringer, G. H.; Zeruolis, V.; Bayley, J. & Boehringer, K. (Open U, Belfast, Northern Ireland) **Stirling: The destructive application of group techniques to a conflict.** *Journal of Conflict Resolution*, 1974(Jun), Vol 18(2), 257-275.—Presents a critique of 2 articles by L. W. Doob and W. J. Foltz (see PA, Vol 51:9724 and Vol 53:Issue 2) describing the conception and execution of a group dynamics workshop for Belfast inhabitants which took place in Scotland in 1972. The theoretical background, practical execution, and subsequent social and political impact of the workshop are assessed, and it is concluded that the goals of the exercise were ill-defined and mutually contradictory.

5158. Boles, Jacqueline & Garbin, Albino P. (Georgia State U) **The strip club and stripper-customer patterns of interaction.** *Sociology & Social Research*, 1974(Jan), Vol 58(2), 136-144.—Studied the social organization of the strip club by relating the effects of environmental and spatial factors on stripper-customer relationships. Data were derived from observations at 9 strip clubs in a large southeastern city, and interviews with 51 strippers at these clubs. Findings illuminate and support the idea that the interactions between strippers and customers are characterized by a counterfeiting of intimacy based on inauthentic relations. (17 ref)—*Journal abstract*.

5159. Bordow, Allan. (U New South Wales, Graduate School of Business, Kensington, Australia) **Aggression and support levels in the dyad: Clarification of a**

**balanced effect.** *Journal of Social Psychology*, 1974(Aug), Vol 93(2), 299-300.—Found a balanced effect between aggression and support usage when same-sex dyads played "Twenty Questions," supporting findings by E. F. Lundgren (see PA, Vol 49:1434) and C. N. Zimet and C. Schneider (1969). However, in opposition to the previous findings, there was an overall higher ratio of aggressive to supportive activity in the pairs.

5160. Buckley, W.; Burns, T. & Meeker, L. D. (U New Hampshire) **Structural resolutions of collective action problems.** *Behavioral Science*, 1974(Sep), Vol 19(5), 277-297.—Considers the general problem of achieving cooperation in human groups and in higher levels of social systems. Social situations are considered where cooperation is problematic because self-interest contradicts group or collective interest: the Prisoners' Dilemma game, the commons' problem, the collective action problem, and the problem of competitive panics. A structural framework and methodology using social system level concepts is introduced to characterize and analyze such problems. It is shown that the various cases have a common underlying structure. In the analysis emphasis is placed on the social context of the problematic situations and the social processes that structure human interaction and collective behavior. The social structuring and restructuring in groups of perceptions and evaluations, action possibilities, decision procedures, and likely interaction patterns of those involved are discussed. (37 ref)—*Journal abstract*.

5161. Burgoon, Judee K. & Burgoon, Michael. (U Florida, Div of Communication Studies) **Unwillingness to communicate, anomia-alienation, and communication apprehension as predictors of small group communication.** *Journal of Psychology*, 1974(Sep), Vol 88(1), 31-38.—Created a new 26-item scale to measure a construct labeled "unwillingness to communicate." The scale was used in conjunction with Dean's Alienation Scale, Srole's Anomia Scale, and the Personal Report of Communication Anxiety for College Students to predict small group interaction behavior. Ss were 283 college students. The scale was the best predictor of tension in the small group. The reliability, criterion-related validity, and potential utility of the scale are discussed. (16 ref)—*Journal abstract*.

5162. Cooper, Lee G. & Thomas, Kenneth W. (U California, Los Angeles) **Divergent perceptions of disagreement.** *Behavioral Science*, 1974(Sep), Vol 19(5), 336-343.—Disagreement in opinions is frequent among individuals in a group, as well as among parties at other levels of living systems. This often becomes evident during decision-making processes, as well as at other times. Such disagreement is predominately viewed as a single homogeneous construct and is used as such in a wide variety of research and action settings in the behavioral sciences. The present study, however, used multivariate individual differences analysis with data from 31 graduate management students to demonstrate that disagreement had systematically varying meaning for different individuals. Results underscore the distinction between disagreement as polarization and disagreement as evenly dispersed opinion. (17 ref)—*Journal abstract*.

5163. Doob, Leonard W. & Foltz, William J. (Yale U) **The impact of a workshop upon grass-roots leaders in Belfast.** *Journal of Conflict Resolution*, 1974(Jun), Vol 18(2), 237-256.—9 mo after 56 persons from the various communities of Belfast had attended a modified Tavistock National Training Laboratory (NTL) Workshop in Scotland, 40 of them were interviewed to determine the effect of that experience. Emphasis was placed upon the changes they had observed within themselves, the organizations they had planned during the workshop, and their own general effectiveness back in Belfast. Results are not clear-cut, but for everyone the workshop itself was an impressive event. Many reported that they had been helped as persons. For some participants the workshop facilitated elaboration or subsequent carrying out of plans of their own devising in spite of intimidation and the difficulties inherent within Northern Ireland. —*Journal abstract.*

5164. Gatton, Michael J. & Tyler, John D. (U North Dakota) **Nonverbal interview behavior and dependency.** *Journal of Social Psychology*, 1974(Aug), Vol 93(2), 303-304.—Observed the nonverbal responses of autonomous and dependent undergraduates to positive and negative interviewer-emitted nonverbal cues. Although Ss maintained more eye contact and smiled more during positive cues, the hypothesis that dependent Ss would be more sensitive to the interviewer's shift from positive to negative nonverbal cues was not supported.

5165. Gormally, James & Hill, Clara E. (American U, Counseling Ctr) **Guidelines for research on Carkhuff's training model.** *Journal of Counseling Psychology*, 1974(Nov), Vol 21(6), 539-547.—Discusses several methodological issues related to R. R. Carkhuff's human relations training model with an emphasis on developing research guidelines. The problems of unclear treatment and control procedures and the lack of placebo controls are presented, followed by measurement issues concerning the proper choice of response measures, limitations of present measures, and the use of rating scales. The issues of individual vs group assessment and training-group follow-up are considered. Each discussion of an issue is accompanied by research guidelines for evaluating the present literature and conducting further research. Several research suggestions are offered which might resolve logical gaps as well as extend the model. (53 ref)—*Journal abstract.*

5166. Greenwood, James G. (Ohio State U) **Opportunity to communicate and social orientation in imaginary reward bargaining.** *Speech Monographs*, 1974(Mar), Vol 41(1), 79-81.—Studied the effect of social orientation (cooperative or competitive) and communication opportunity (restricted, moderate, unrestricted) on bargaining. 84 undergraduates were paired, 7 pairs being assigned to each combination of conditions. The pairs, "row" and "column," were to reach agreement in selecting a cell in a  $2 \times 3$  matrix, representing a dollar sum. The optimum cell for row and column was different unless agreement was reached on splitting the pay-off of a selected cell. Agreement was reached significantly ( $p < .05$ ) more often when cooperative social orientation and unrestricted communication were combined. No other combinations or interactions were significant. —C. A. Sherrard.

5167. Grzelak, Janusz & Tyszk, Tadeusz. (Inst for Educational Research, Warsaw, Poland) **Some preliminary experiments on cooperation in N-person games.** *Polish Psychological Bulletin*, 1974, Vol 5(2), 81-91.—Conducted 4 preliminary experiments with high school students as Ss on cooperation in N-person (6-10) nonconstant-sum games to determine whether the frequency of cooperative actions (Strategy C) depended on the profitability of the choices involved, on information about outcome after each choice, on communication between partners, and on the mutual attitude of the partners; Ss were also able to use individual action strategy (Strategy D). Results show that (a) opportunities for communication between players increased the frequency of choices only in games of the Prisoner's Dilemma type in which the formation of a 2-3 person coalition made the C choice profitable, (b) cooperation level was higher in groups comprising Ss favorably disposed to each other than in groups with Ss without such disposition, and (c) level of cooperation did not affect information about the outcomes of each game. One of the weaknesses of the preliminary is that the payoff matrices did not create a clear-cut conflict of interest (too-low payoffs, not sufficiently differentiated). (21 ref)—*Journal abstract.*

5168. Harris, Thomas E. & Smith, Robert M. (Rutgers State U) **An experimental verification of Schelling's tacit communication hypothesis.** *Speech Monographs*, 1974(Mar), Vol 41(1), 82-84.—Tests explicit predictions of Thomas C. Schelling's tacit communication hypothesis (1960). Without using verbal communication, 142 undergraduates in "real partner" and "hypothetical partner" groups tried to match the partner's responses to multiple-choice questions. Specific responses were as predicted, regardless of group and of previous interaction with partners.

5169. Hogan, Daniel B. **Encounter groups and human relations training: The case against applying traditional forms of statutory regulation.** *Harvard Journal on Legislation*, 1974(Jun), Vol 11(4), 659-701.—Examines the purposes, goals, and legal implications of encounter groups. Recommendations on how encounter groups should be regulated are presented. It is suggested that encounter groups should not be regulated through psychology laws or statutory regulations because (a) the groups cannot be defined precisely enough to satisfy constitutional requirements, (b) the evidence of danger and risk is insufficient to warrant governmental interference, (c) standards and criteria for competency of encounter group leaders have not been adequately developed, and (d) adequate methods of measuring competence have also not been developed. Instead of statutory regulation, emphasis should be placed on educating the public, further research, and the development of nongovernmental accrediting organizations to study the effects and potential values of encounter groups.—*Author abstract.*

5170. Johnson, David W. (U Minnesota, Twin Cities) **Communication and the inducement of cooperative behavior in conflicts: A critical review.** *Speech Monographs*, 1974(Mar), Vol 41(1), 64-78.—Reviews conflict studies from the viewpoint of the types of communication used, concluding that the lack of an operational

definition of "communication" common to all studies has impeded progress in the field.

5171. Katz, David. (Washington U) **An automated system for eliciting and recording self-observations during dyadic communication.** *Behavior Therapy*, 1974(Oct), Vol 5(5), 689-697.—Describes an electromechanical system in which Ss are trained to avoid the onset of a cue light by reporting moment-to-moment self-observations at a predetermined high rate. Videotape and event recorders provide a sequential record of self-report responses in correct temporal relationship with other interaction variables.

5172. Kervin, John B. (U Toronto, Ontario, Canada) **Extending expectation states theory: A quantitative model.** *Sociometry*, 1974(Sep), Vol 37(3), 349-362.—Expectation states theory has been developed to account for observed power and prestige structures in small, task-oriented groups. An extension of the theory to permit quantitative predictions of status-related behavior is described. Terms of the theory are reinterpreted as probabilities, and a function for combining probabilities is derived. The resulting path probabilities are combined with a decision-theory framework to provide a model for predicting the proportion of self-responses when disagreements occur in a binary choice group task. Support for the model was obtained when applied to 2 sets of data from past experiments. (17 ref)—*Journal abstract*.

5173. Kidder, Louise H. & Stewart, V. Mary. (Temple U) **The psychology of intergroup relations: Conflict and consciousness.** New York, NY: McGraw-Hill, 1975. xv, 128 p. \$4.95.

5174. Levin, Ellen M. & Kurtz, Robert R. (Illinois State Psychiatric Inst, Chicago) **Structured and non-structured human relations training.** *Journal of Counseling Psychology*, 1974(Nov), Vol 21(6), 526-531.—Investigated participant perceptions following structured and nonstructured human relations training. The design included 3 structured and 3 nonstructured groups and 3 leader teams with each team conducting 1 group under each of the 2 formats. 21 male and 21 female graduate students were Ss. The Group Opinion Questionnaire was administered to participants at the 12th (final) session. Participants in structured groups reported greater ego involvement in their groups, more self-perceived personality change since joining the group, and greater group unity than did participants in nonstructured groups. Evidence suggests that greater leader experience is associated with more favorable participant perceptions. (22 ref)—*Journal abstract*.

5175. Lorber, Nell M. (Newark State Coll) **Interpersonal feelings and their perception: A review of research.** *Handbook of International Sociometry*, 1973, Vol 7, 60-70.—Surveys research on the relationships among interpersonal feelings and perceptions of them. Most of the studies involve elementary school children. No consistent pattern of research results regarding the extent of mutuality in individuals' feelings towards each other was found. Most individuals tend to perceive others' feelings toward them with at least a moderate degree of accuracy. Individuals tend to feel the same way about others as they perceive others to feel about them. This congruency tendency is independent of both

accuracy in the perception of feelings and the mutuality of feelings. (79 ref)—*R. J. Ambrosino*.

5176. Martin, J. David; Williams, J. Sherwood & Gray, Louis N. (Lakehead U, Thunder Bay, Ontario, Canada) **Norm formation and subsequent divergence: Replication and variation.** *Journal of Social Psychology*, 1974(Aug), Vol 93(2), 261-269.—Administered to 12 dyads of high-school-age Canadians a dot-counting estimation task in 6 trials, each containing 50 judgments. The 1st, 4th, 5th, and 6th trials were individual response trials in which Ss were not aware of one another's estimates; the 2nd and 3rd trials were group trials in which judgments were announced aloud. Convergence of judgments was observed between the 1st and 3rd trial, and divergence between the 3rd and subsequent trials. Divergence did not produce disparities equal to those present at the 1st (baseline) trial. Similar results were obtained in a pretest involving 60 American undergraduates tested in triads; these results were not as clear-cut, presumably owing to the smaller number of judgments per trial and resulting instability of the averages. It is concluded that some divergence is normal after a short-term, norm-formation experiment. The question of when to call a behavioral uniformity a "norm" is discussed. (17 ref)—*Journal abstract*.

5177. Miller, N. & Baron, R. S. (U Southern California) **On measuring counterarguing.** *Journal for the Theory of Social Behaviour*, 1973(Apr), Vol 3(1), 101-118.—Outlines problems in measuring counterarguing and establishing its causal role in the persuasion process. Counterarguing is the silent dialogue engaged in by people listening to an attitude change message in order to help them resist persuasion. The hypothesis that this phenomenon helps reduce change is examined. Typical measures of counterarguing and their inadequacies are discussed. The causal relationship between counterargument and change is questioned. Suggestions are made for establishing construct validity for counterarguing. (30 ref)—*R. S. Albin*.

5178. Patterson, David L. & Smits, Stanley J. (Georgia State U) **Communication bias in black-white groups.** *Journal of Psychology*, 1974(Sep), Vol 88(1), 9-25.—Defined prejudice as a statistically significant bias in the direction of verbal statements in T groups whose membership was balanced by race and sex. 3 major hypotheses were tested with a total of 16 white and black male and female graduate students. Results are discussed in relation to the nature of prejudice and communication dynamics. 2 T-group methodologies were contrasted as an exploration of potential intervention strategies. Results indicate that both race and sex contributed to significant biases, although race seemed to be the more substantive contributor. (22 ref)—*Journal abstract*.

5179. Perry, Raymond P. & Boyd, J. Edwin. (U Manitoba, Winnipeg, Canada) **Language differences and message length as determinants in communicating personality judgments between people.** *Journal of Social Psychology*, 1974(Oct), Vol 94(1), 83-94.—2 experiments examined how inter-S language differences and message length influenced the accuracy with which people communicate their personality judgments to other individuals; Ss were a total of 90 students. An interper-

sonal communication paradigm was used in which an encoder made personality judgments of object persons based on videotaped interviews. A decoder viewed the object person videotapes and attempted to match each judgment with the intended referent. Exp I, which tested the effect of reducing inter-S language variability on impression communication accuracy, found that efficiency improved and that too much control interfered with responding and produced an increased communication error rate. Exp II, which investigated the effect of 10, 20, and 30 word messages on communication accuracy, indicated that increasing information did not facilitate communication accuracy (15 ref)—*Journal abstract*.

5180. Pluckhan, Margaret L. (U Denver) **An investigation of sociometric choices in various behavioral settings.** *Handbook of International Sociometry*, 1973, Vol 7, 43-51.—Sociometric tests are used to assess group structure and reveal member choices, but tell nothing about the reasons for the choices. An attempt was made to identify some of these reasons by using the personality dimensions of the Fundamental Interpersonal Relations Orientation, Behavior (FIRO-B). 73 professional nurses were divided into 7 groups of 9-11 members, and each group was assigned a task-oriented activity. 3 hypotheses were advanced based on the fact that the Ss were to make a task-oriented sociometric choice and on the assumption that inclusion (or togetherness) and control (or decision making) are work or task functions and factors, but that affection is not. All hypotheses were rejected. There was no significant difference between the most chosen group and the least chosen group as it related to expressed or wanted inclusion and control. A significant difference between the 2 groups was observed with regard to expressed and wanted affection.—R. J. Ambrosino.

5181. Rodrigues, Aroldo & Ziviani, Cilio R. (Pontificia U Católica, Rio de Janeiro, Brasil) **A theoretical explanation for the intermediate level of tension found in nonbalanced P-O-X triads.** *Journal of Psychology*, 1974(Sep), Vol 88(1), 47-56.—Previous empirical evidence has abundantly demonstrated that people report an intermediate level of tension for triadic interpersonal relations of the classical P-O-X type identified by F. Heider (see PA, Vol 33:971) when the P-O link is negative. Low tension is found in balanced triads and high tension in imbalanced ones when the P-O bond is positive. It is postulated that the opposing forces of balance and of agreement found in all 4 P-O-X triads in which the P-O bond is negative, in addition to T. M. Newcomb's lack of engagement hypothesis, may also account for the intermediate level of tension found in practically all experiments in this area. In the present study 32 undergraduates were grouped as high or low conformists according to the Comrey Personality Scale, and were later asked to rate hypothetical triads with a negative P-O bond. Results confirm the hypotheses that high conformists, who supposedly value agreement with others more than low conformists (or are less bothered by disagreement than the latter), report significantly less tension and less willingness to change P-O-X triads with agreement than those with disagreement when such triads have a negative P-O bond. (30 ref)—*Journal abstract*.

5182. Street, Warren R. (Central Washington State Coll) **Brainstorming by individuals, coacting and interacting groups.** *Journal of Applied Psychology*, 1974(Aug), Vol 59(4), 433-436.—36 3-person groups of undergraduate volunteers worked in 3 different settings to produce answers to 3 brainstorming problems. Ss worked independently in separate rooms (individual condition), independently in the same room (coaction condition), and cooperatively in the same room (interaction condition). Conflicting theories predicted lower productivity (a) either in the interaction and coaction conditions, where co-workers were physically present (social facilitation theory); or (b) only in the interaction condition, where group norms could be formed. Results show that the independent and coaction conditions produced the same number of solutions and the interaction condition was significantly ( $p < .001$ ) inferior to both. This suggests that public action, not physical proximity, is responsible for individual-group differences in brainstorming. (16 ref)—*Journal abstract*.

5183. Westen, T. Edward & Buckley, James J. (U South Carolina) **Toward an explanation of experimentally obtained outcomes to a simple, majority rule game.** *Journal of Conflict Resolution*, 1974(Jun), Vol 18(2), 198-236.—Examined the problem of many solutions to  $n$ -person games, using a 4-person simple, majority rule game. 97 experimental trials are employed to demonstrate that 3 different solutions (symmetric, inflated, and partitioned solutions) can be differentially predicted as one varies the structural characteristics of otherwise strictly identical games in characteristic function form. Findings indicate that systematic theory construction about the structure of conflict is a fruitful area for inquiry. (25 ref)—*Journal abstract*.

### Social Perception & Motivation & Attitudes

5184. Asher, Nancy W. (U Illinois, School of Social Work) **Manipulating attraction toward the disabled: An application of the similarity-attraction model.** *Rehabilitation Psychology*, 1973(Win), Vol 20(4), 156-164.—Obtained from 81 female Ss ratings of able-bodied and disabled persons who were attitudinally similar or dissimilar to the Ss. Results indicate that similarity increased the attraction of both able-bodied and disabled. Similar disabled were liked as much as similar able-bodied, and able-bodied and disabled were rated equally unattractive when presented as dissimilar. Findings are considered in terms of their implications for modifying attitudes towards the disabled. (24 ref)—*Journal abstract*.

5185. Audi, Robert. (U Texas) **On the conception and measurement of attitudes in contemporary Anglo-American psychology.** *Journal for the Theory of Social Behaviour*, 1972(Oct), Vol 2(2), 179-203.—Discusses the concept that reliable prediction of a person's behavior does not depend only on knowledge of person's attitudes. Suggestions are made for improvements in attitude measurement aimed at maximum relevance to the prediction of behavior. Contemporary views on the nature of attitudes are summarized. A commonsense approach to attitude conception is detailed. These new definitions in turn suggest a different emphasis in the measurement of attitudes. The new concept of attitude and measurement is described in Lewinian terms and

suggestions are made for evaluating them experimentally. (31 ref)—R. S. Albin.

5186. Austin, William & Walster, Elaine. (U Virginia) **Participants' reactions to "equity with the world."** *Journal of Experimental Social Psychology*, 1974(Nov), Vol 10(6), 528-548.—Tested 4 hypotheses derived from equity theory to investigate how people react when they discover that their partners are sacrificing the equity of their relationships to maintain "equity with the world" (i.e., equity with others in general). It was predicted and found that whether a person focuses on "person-specific equity" or equity with the world depends on whether he feels accountable for his behavior. In an experiment with 135 female undergraduates, when participants knew they could not be held accountable for their actions, they routinely sacrificed person-specific equity to maintain equity with the world. However, when they knew they would have to confront their 2nd partner eventually, they rarely sacrificed person-specific equity. Results show that such pessimism (by persons desiring to restore equity with the world) is not justified, since inequitably-treated partners' dissatisfaction and hostility were markedly blunted when individuals thought their "unfair" partner was trying to restore equity with the world. (35 ref)—*Journal abstract*.

5187. Baglioni, L.; Nencini, R. & Meschieri-Belcacci, M. V. (CNR Inst di Psicologia, Rome, Italy) **[Group Influence on the phenomenon of destructive obedience: A study with hypothetical subjects.]** (Ital) *Archivio di Psicologia, Neurologia e Psichiatria*, 1974(Jan), Vol 35(1), 26-35.—Divided 363 students into 4 groups according to the 4 factors that may influence aggressivity manifestations: public vs private reactions, and money rewarded in proportion to 2 levels of electric shock. Results show that a dragging effect (higher aggressivity) was exerted by the public situation only when a descending voltage from 50 volts to 0 volts was present. Money also proved to be an effective reward as well.—L. L'Abate.

5188. Balzer, Hans G.; Schümer-Kohrs, Anke & Schümer, Rudolf. (U Mannheim, W Germany) **[Effects of context upon the formation of impressions.]** (Germ) *Zeitschrift für Experimentelle und Angewandte Psychologie*, 1974, Vol 21(1), 25-38.—Tested several hypotheses derived from N. H. Anderson's model of formation of impressions. 72 students rated character traits of a fictitious person on a 21-step scale. Analysis of variance of the results indicated that component ratings tended to be influenced by the context in which they were presented. This effect is called assimilation or positive context effect. Other hypotheses which, according to the model, should increase the context effect could not be confirmed by the experimental results. (English & French summaries) (30 ref)—W. J. Koppitz.

5189. Banikiotes, Paul G. & Banikiotes, Florence G. (U Notre Dame, Inst for Studies in Education) **Male and female perceptions of liberated vs conventional sex roles.** *Psychonomic Science*, 1972(Oct), Vol 29(2), 111-112.—30 male and 30 female undergraduates read attitudinal statements of 2 male and 2 female hypothetical persons indicating preference for liberated or conservative sex roles. Ss then rated the persons on Byrne's Interpersonal Judgment Scale. No differences were found between male and female Ss in their

perception of the 4 persons. The liberated female was seen as the most intelligent of the 4 persons and was also considered to be less moral and more aware of current events than the conservative female. The liberated male was seen as more intelligent, less moral, and more attuned to current events than the conservative male. —A. Olson.

5190. Bragg, Barry W. & Allen, Vernon. (U Toronto, Ontario, Canada) **The role of public and private support in reducing conformity.** *Psychonomic Science*, 1972(Oct), Vol 29(2), 81-82.—In a study with 80 undergraduates, a Crutchfield-type conformity apparatus was used to give each S public social support, private social support, or subsequent public social support after appearing to have been the first person to dissent publicly from a simulated group. All 3 types of social support were equally effective in reducing conformity relative to a unanimous group. Results suggest that interpersonal factors are not crucial in explaining independence produced by a social supporter; rather, effectiveness of the social supporter may lie in his providing an independent confirmation of social and physical reality.—*Journal abstract*.

5191. Buckhout, Robert et al. (Brooklyn Coll, Ctr for Responsive Psychology, City U New York) **Determinants of eyewitness performance on a lineup.** *Bulletin of the Psychonomic Society*, 1974(Sep), Vol 4(3), 191-192.—A simulated crime was staged before 64 undergraduate witnesses in order to generate eyewitness reports to be analyzed for accuracy. 48 of the witnesses attempted to pick out the suspect from 2 videotaped lineups—one with and one without the suspect. Successful witnesses showed significantly fewer errors of commission than those who picked the suspect but impeached their identification with another choice. There were 13.5% positive identifications, 13.5% impeached, 40.3% mistaken identifications, and 19.2% nonidentifications. An analysis is made of the differences between successful and unsuccessful eyewitnesses.—*Journal abstract*.

5192. Crawford, Jeffrey L. & Williams, Daniel C. (Walter Reed Army Medical Ctr, Washington, DC) **Contingent reinforcement and response constraints as confounding factors in attitude attribution.** *Journal of Social Psychology*, 1974(Oct), Vol 94(1), 95-102.—Investigated the roles of contingent reinforcement and response constraints in attitude attribution in 2 experiments. Ss were a total of 492 students. Exp I indicated that behavior observed to be highly constrained in terms of alternative available behaviors was no more informative to Ss than behavior observed to be under the control of a rather powerful reinforcement contingency. Only when both constraint and reinforcement control ceased to be discriminated was attribution possible. Exp II showed that the effectiveness of multiple observations of behavior was seriously attenuated by the presence of contingent reinforcement. Observed behavioral consistency led to an increase in Ss' agreement or disagreement with a statement of attributed attitude only when contingent reinforcement was not observed.—*Journal abstract*.

5193. Dillman, Don A. & Christenson, James A. (Washington State U) **Toward the assessment of public values.** *Public Opinion Quarterly*, 1974(Sum), Vol 38(2), 206-221.—Discusses improved techniques for assessing

public values in light of inadequacies of single economic indicators. A particular conceptualization (the value framework) was applied in conjunction with a methodological procedure (factor analysis) to provide a description of the hierarchical nature of public values. Factor analysis was effective in identifying homogeneous factors in some value areas. Factor loadings and groupings are presented in tabular form. (24 ref)—M. K. Phifer.

5194. DiMatteo, Maryanne R. (Tufts U) **The effects of perceived deviancy on interpersonal evaluation.** *Psychonomic Science*, 1972(Oct), Vol 29(2), 97-99.—60 male and 60 female high school students read a fictitious transcript from an interview for a study-abroad program. During the interview, a male college student applicant (a) revealed that he had experienced either a happy or an unhappy childhood; and (b) presented himself as normal, previously mentally ill, or as having suffered a serious physical illness. Ss evaluated the stimulus person less favorably when he reported either an unhappy childhood or a serious physical illness. The predicted dislike and derogation of the mentally ill stimulus person was not evidenced, and the Ss rated him as the most interesting. Consistent sex differences emerged, as female Ss evaluated the stimulus person in more favorable terms and indicated that if they were to meet him they would like him significantly more than did male Ss.—*Journal abstract*.

5195. Edwards, David J. (Rhodes U, Grahamstown, South Africa) **The use of orientation asymmetry as a cue in the interpretation of schematic social configurations.** *Journal of Social Psychology*, 1974(Aug), Vol 93(2), 219-228.—Prepared descriptions of 4 dyadic social encounters in which one interactor was expected to have greater need for or tolerance of direct gaze than the other. 80 Ss (mostly undergraduates) listened to one of the descriptions and were shown a set of figure pairs mounted on cards in asymmetrical orientation patterns. They were asked to identify one of the interactors described to them with one of the figures on the stimulus card. It was predicted that if they were asked to identify the high eye-contact interactor they would select the more directly facing of the 2 figures, but if asked to select the low eye-contact interactor they would select the less directly facing figure. Although responses were to some extent determined by the characteristics of the figures themselves, the cue furnished by the asymmetrical orientation patterns also proved to be a powerful determiner of choices, in accordance with prediction. It is argued that results provide a basis for the interpretation of figure placements obtained with the doll placement technique. (20 ref)—*Journal abstract*.

5196. Fisher, Jeffrey D. (Purdue U) **Situation-specific variables as determinants of perceived environmental aesthetic quality and perceived crowdedness.** *Journal of Research in Personality*, 1974(Aug), Vol 8(2), 177-188.—Hypothesized that relevant situation-specific variables may act along with objective physical conditions to determine environmental perception, and that the exclusive use of the physical level of an environmental stimulus to predict behavior may, therefore, be inadequate. A  $2 \times 4$  between-Ss design was employed in which an attitudinally similar or dissimilar confederate interacted with S at 1 of 4 distances. Ss were 129

undergraduates. As hypothesized, Ss who interacted with a similar confederate judged the environment to be of higher aesthetic quality, perceived themselves to be less crowded, and felt affectively more positive than Ss who interacted with a dissimilar other. (45 ref)—*Journal abstract*.

5197. Frauenfelder, Kenneth J. (Western Illinois U) **A cognitive determinant of favorability of impression.** *Journal of Social Psychology*, 1974(Oct), Vol 94(1), 71-81.—Investigated the relationship of integrative complexity to the favorability of impressions in 115 Ss. It was hypothesized that (a) favorability of impressions of Ss of high integrative complexity would be less affected by a positive or negative set than the favorability responses of Ss low in integrative complexity and (b) when no set was induced, Ss of high integrative complexity would form more favorable impressions of an inconsistently behaving target person than Ss of low integrative complexity. The hypotheses were basically supported for female Ss but not for male Ss. (30 ref)—*Journal abstract*.

5198. Galbreath, Judith & Feinberg, Lawrence B. (Pennsylvania State U, Div of Counseling) **Ambiguity and attitudes toward employment of the disabled: A multidimensional study.** *Rehabilitation Psychology*, 1973(Win), Vol 20(4), 165-174.—Exposed 240 undergraduates who scored high and low on the Budner Scale for Tolerance-Intolerance of Ambiguity to 1 of 12 vignettes describing a disabled job applicant and a potential employment situation in varying degrees of ambiguity. Ss were then asked to respond to an "attitude toward employment of disabled persons" scale. Findings confirm the existence of more negative attitudes among Ss intolerant of ambiguity. While intolerant Ss were not significantly affected by variations in situational and focal stimulus (disability type) ambiguity, tolerant Ss' responses were affected by variation in focal stimulus ambiguity. Implications for rehabilitation and job placement of the disabled are discussed. (28 ref)—*Journal abstract*.

5199. Hamner, W. Clay & Harnett, Donald L. (Michigan State U) **Goal setting, performance and satisfaction in an interdependent task.** *Organizational Behavior & Human Performance*, 1974(Oct), Vol 12(2), 217-230.—Determined the effects of goals on performance and the effect of performance on reported levels of satisfaction in a competitively structured interdependent bargaining task. Ss were 160 male undergraduates. Satisfaction was assessed by the W. E. Scott et al semantic differential satisfaction questionnaire. Results support E. A. Locke's 1969 theory that the most immediate, direct motivational determinant of task performance is S's goal, and D. R. Ilgen and B. W. Hamstra's 1972 theory that satisfaction with one's performance is a function of both the difference between actual performance and performance goals, and of the difference between actual performance and performance of a reference person. Satisfaction and performance were strongly related only up to the point where a person exceeded his goal or his reference person's outcome. (37 ref)—*Journal abstract*.

5200. Harris, Mary B. (U New Mexico) **Mediators between frustration and aggression in a field experiment.** *Journal of Experimental Social Psychology*,

1974(Nov), Vol 10(6), 561-571.—320 male and female 18-yr-old Ss were assigned to 1 of 32 experimental conditions in a  $2 \times 2 \times 2 \times 2 \times 2$  factorial design. Either a male or female E, saying "Excuse me" or not, dressed in high or low status clothing, cut in line in front of the S, who was standing near the front or back of the line. Verbal and nonverbal aggressiveness were coded and summed to measure total aggression. Ss near the front of the line or interacting with a low status E were more aggressive than those at the back of the line or seeing a high status E. Less aggression was directed against the female E or one who said "Excuse me," and there was a strong tendency for Ss to be more aggressive to a same-sex E. (26 ref)—*Journal abstract*.

5201. Hautala, Jacob E. & Spungin, Helene. (Colorado State U) **Effects of initiation severity and interest on group attitudes.** *Journal of Social Psychology*, 1974(Aug), Vol 93(2), 245-259.—Examined some conditions of the generality of the finding that a severe initiation leads to liking for a group, using 28 male and 28 female undergraduates as Ss. Sex, interest in joining a group, and severity of initiation were included in a  $2 \times 2 \times 2$  design. It was found that females liked the group members most following a severe initiation, but this was not true for males. Males had the least interest in continuing with a group following a severe initiation, while the females' interest was almost unaffected by their initiations. Ss who were most interested in joining in the beginning perceived the initiation as most severe. The perception of the meaningfulness of the initiation was influenced by all 3 independent variables in a triple interaction.—*Journal abstract*.

5202. Himmelfarb, Samuel & Arzai, Daniella. (Tel-Aviv U, Israel) **Choice and source attractiveness in exposure to discrepant messages.** *Journal of Experimental Social Psychology*, 1974(Nov), Vol 10(6), 516-527.—Investigated the effects of choice, source attractiveness, and discrepancy size on the acceptance of a message about a tuition increase under high involvement conditions. Ss were 280 undergraduates. In keeping with dissonance theory predictions, results show that when Ss chose to expose themselves to the discrepant message, the message from an unattractive source produced the most opinion change. Under no-choice conditions, more change was produced by the message from the attractive source. However, this effect only occurred at the highest message discrepancy level. (20 ref)—*Journal abstract*.

5203. Hutton, Geoffrey. (Bath U of Technology, School of Management, Bristol, England) **Assertions, barriers and objects: A conceptual scheme for the personal implications of environmental texture.** *Journal for the Theory of Social Behavior*, 1972(Apr), Vol 2(1), 83-98.—Discusses the psychological ideas arising from the need to consider how an apparently similar physical and social environment can present itself in contrasted forms to different individuals. The subjective definition of environment of each person is presented. The identification of environmental goals and noxious is viewed as a function of the needs of the individual organism. The environment is described in Lewinian terms with boundaries to be closed or opened to persons who can act upon it. Assertion is represented as movement towards the environmental boundary; degree

of distance is distance between organism and boundary; and degree of complexity is complexity of environmental action towards the organism.—*R. S. Albin*.

5204. Iwawaki, Saburo & Lerner, Richard M. (Chukyo U, Japan) **Cross-cultural analyses of body-behavior relations: I. A comparison of body build stereotypes of Japanese and American males and females.** *Psychologia: An International Journal of Psychology in the Orient*, 1974(Jun), Vol 17(2), 75-81.—Intercultural continuity of body build-behavior stereotypes was assessed by asking Japanese students to attribute 30 behavioral descriptions to pictures of male endomorphs, mesomorphs, and ectomorphs. Ss were 90 males and 90 females 18-21 yrs old; none had ever taken a psychology course. Both sexes attributed predominantly positive evaluations to the mesomorphs, and predominantly negative evaluations to the other 2 types. The students reversed American stereotypes by showing a stronger negative reaction to the ectomorph.—*R. D. Nance*.

5205. Izzett, Richard R. & Leginski, Walter. (State University Coll New York, Oswego) **Efficacy of associative links in impression formation: A test of the information hypothesis.** *Journal of Social Psychology*, 1974(Aug), Vol 93(2), 297-298.—Replicated R. Izzett and W. Leginski's (see PA, Vol 48:11497) finding that associative links (e.g., "is") are more effective in producing extreme evaluations of stimulus persons than dissociative links (e.g., "is not") using an extended sampling base. This effect was due to the greater information-conveying properties of associative links.

5206. Izzett, Richard R. & Leginski, Walter. (State University Coll New York, Oswego) **Group discussion and the influence of defendant characteristics in a simulated jury setting.** *Journal of Social Psychology*, 1974(Aug), Vol 93(2), 271-279.—Groups of undergraduates ( $N = 50$ ) ranging in size from 4 to 6 read D. Landy and E. Aronson's (1969) hypothetical case concerning negligent automobile homicide. Each S within each group received an identical version of the case involving either an attractive or unattractive defendant. Ss were asked individually to sentence the defendant after reading the case. Then each S was asked to make public his sentence to fellow group members, as well as a brief statement of the reasons for his sentence. Following this, all Ss were asked to discuss the case. Each S then rendered a postdiscussion sentence. Results indicate that (a) prior to group discussion Ss in the unattractive defendant treatment sentenced the defendant to a significantly longer prison term than Ss in the attractive defendant treatment; (b) after group discussion there was a significant shift toward leniency in the unattractive defendant treatment, while there was no significant change in the attractive defendant treatment; and (c) the postdiscussion sentences of Ss in the unattractive defendant treatment did not significantly differ from those in the attractive defendant treatment.—*Journal abstract*.

5207. Johnson, Charles D. (Michigan State U) **Competence motivation and interpersonal evaluation.** *Bulletin of the Psychonomic Society*, 1974(Sep), Vol 4(3), 199-200.—Examined interpersonal attraction in a face-to-face setting in relation to attitude similarity-dissimilarity and accomplice liking for 80 undergraduate Ss. In

contrast to D. Byrne and W. Griffitt's (see PA, Vol 41:539) previous research, attraction scores in the dislike range were observed. Ss reciprocated the stranger's evaluation and attraction toward them regardless of the degree of attitude similarity. Both reciprocal attraction and similarity attraction effects are discussed in terms of Byrne and G. L. Clore's (see PA, Vol 41:13536) competence-reinforcement theory of attraction.—*Journal abstract.*

5208. Johnson, Ronald W. & MacDonnell, Joan. (St Francis Xavier U, Antigonish, Nova Scotia, Canada) **The relationship between conformity and male and female attitudes toward women.** *Journal of Social Psychology*, 1974(Oct), Vol 94(1), 155-156.—Presents results of a study of 60 male and female students that support the hypothesis that sex differences in conformity behavior are less pronounced than reported in earlier studies and that there is a negative relationship between attitudes toward the role of women and conformity.

5209. Kaplan, Martin F. (Northern Illinois U) **Context-induced shifts in personality trait evaluation: A comment on the evaluative halo effect and meaning change interpretations.** *Psychological Bulletin*, 1974(Nov), Vol 81(11), 891-895.—Evaluative responses to personality traits are affected by the particular context of other traits ascribed to the stimulus person. One interpretation has invoked a denotative change in trait meaning, which then mediates evaluative change. A second interpretation has proposed that meaning is invariant across contexts, but that the response to the trait is an amalgamation of evaluative response to both person and trait. A review of the literature shows that research has employed stimulus substitution, denotative ratings, and trait evaluative variability as strategies in comparing these formulations, but no one test has proven crucial. The evidence, however, is shown to be more consistent with an evaluative halo influence than with a denotative meaning-change process.—*Journal abstract.*

5210. Karpienia, Joseph & Zippel, Bert. (Hunter Coll, City U New York) **Ethnicity and helping behavior.** *Journal of Social Psychology*, 1974(Oct), Vol 94(1), 31-32.—Investigated the extent to which ethnicity of persons needing help influences helping behavior in others of the same or a different ethnic group where all participants are of the same social class. Telephone calls were made by an E assuming either an Irish or Italian surname to 50 randomly selected respondents with an Irish and 50 with an Italian surname. Ss were asked to help by filling out a questionnaire, which would be mailed to them, about the problems of living in New York City. There were no significant differences among the groups of Ss, indicating that social class, not ethnicity, of caller and respondents may account for earlier group differences found in helping behavior.—*Journal abstract.*

5211. Kimball, Richard K. & Hollander, Edwin P. (State University Coll New York, Fredonia) **Independence in the presence of an experienced but deviate group member.** *Journal of Social Psychology*, 1974(Aug), Vol 93(2), 281-292.—Provided 3 possible alternatives in response to social influence: agreement with a majority, agreement with a minority, or independence from both. 40 female undergraduates, in groups of 5, initially made

perceptual judgments of unambiguous stimuli in a modified Crutchfield apparatus with 3 response alternatives. In the 1st response position, S received apparent agreement from either 3 or from only 1 of the other 4 during the initial phase. In each group the deviate from the majority judgment had been described as either experienced or inexperienced at the task. In a 2nd phase, all Ss were placed in the last response position for judgments of highly ambiguous stimuli. For 15 critical trials, they saw the majority continue to pick one alternative, and the deviate another. On these trials the S could agree with the majority, with the deviate, or with neither. Results show no major effect for the majority vs minority agreement. However, the presence of an experienced deviate did lead to decreased agreement with the majority, but without more agreement with the deviate. Instead, the presence of an experienced deviate significantly increased independence from all the others. (17 ref)—*Journal abstract.*

5212. La Fave, Lawrence; Haddad, Jay & Marshall, Nancy. (U Windsor, Ontario, Canada) **Humor judgments as a function of identification classes.** *Sociology & Social Research*, 1974(Jan), Vol 58(2), 184-194.—Tested a modified version of Hobbes' superiority theory of humor in relation to identification classes (i.e., a vicarious superiority theory of humor). "Joke content" concerned a sit-in which occurred at a Canadian university. Ss were 25 undergraduates in favor of and 25 opposed to the sit-in. Consistent with prediction, each group found that permutation of jokes funnier in which the positive identification class was victorious and the negative class the butt, rather than the opposite permutation. Reasons for preferring the identification classes construct to that of reference group are discussed. (21 ref)—*Journal abstract.*

5213. Mahoney, E. R. (Western Washington State Coll) **Compensatory reactions to spatial immediacy.** *Sociometry*, 1974(Sep), Vol 37(3), 423-431.—Within the setting of a college library, a spatial invasion experiment was conducted to test for the relationship between degree of spatial invasion, sex of S, and specified compensatory behaviors. 10 male and 10 female undergraduates who were seated in the library were Ss; 2 categories of motor responses (flight reactions and cross-glancing, leaning, or blocking) were observed when a female invader occupied 1 or 4 levels of spatial immediacy—seated adjacent to S, directly across from S, or 2 or 3 seats adjacent to S. Results indicate that certain spatial arrangements previously designated as invasion conditions may not be invasions. The previously reported compensatory relationship between spatial immediacy and other immediacy behaviors was not supported. Ss decrease, rather than increase, motor responses. Data further suggest sex differences in the nature of the compensatory reactions to spatial invasion.—*Journal abstract.*

5214. Mann, J. Fraser & Taylor, Donald M. (McGill U, Montreal, Quebec, Canada) **Attribution of causality: Role of ethnicity and social class.** *Journal of Social Psychology*, 1974(Oct), Vol 94(1), 3-13.—Attempted to determine whether processes involved in trait attribution also operate in the attribution of causality for behaviors of members representing different ethnic and social class groups. 100 middle class English Canadian and 64

French Canadian Ss judged the relative importance of the internal traits of actors in causing them to behave in certain ways. The actors were described as belonging to 1 of the 2 ethnic groups the middle or lower class or some combination of the 2. Ss judged actors' behavior as either socially desirable or socially undesirable. Results provide partial support for the expected relationships between ethnocentric attitudes and stereotypes and degree of perceived internality for behavior. Thus, Ss tended to make more favorable attributions to members of their own social groups than for members of "outgroups," and to attribute causality in ways consistent with social stereotypes. Results also demonstrate that other principles operated in the complex process of causal attribution in a cross-cultural context. (18 ref)—*Journal abstract*.

5215. Mantell, David M. *True Americanism: Green Berets and war resisters: A study of commitment*. New York, NY: Teachers Coll Press, 1974. viii, 285 p. —Reports a study of family relationships, patterns of social and sexual development, personality traits, academic attitudes, relation to authority figures, and reactions to situations involving violence among groups of 25 Green Berets and 25 Vietnam war resisters. The role of early training and environment in shaping the attitudes of these 2 opposing groups is emphasized. (50 ref)

5216. Michellini, Ronald L. & Meant, Lawrence A. (State University Coll New York, Brockport) *Reactions to threat as a function of equity*. *Sociometry*, 1974(Sep), Vol 37(1), 412-419. —Investigated the influence of the norm of equity on affective reactions to receiving either a threat or a suggestion. After working on a pretask, 60 male undergraduates were given \$6 to divide between themselves and another worker who sent them a threat, a suggestion, or no message. Affective reactions to the messages, which attempted to influence reward allocation, were related to the fairness of the requested distribution. Although the source of a threat was evaluated somewhat less favorably than the source of a suggestion (or no message), this difference was seldom significant and never as large as the differences resulting from the manipulation of equity. Results suggest that affective reactions to coercive influence attempts differ as a function of whether or not the desired behavior violates a norm. —*Journal abstract*.

5217. Mikula, Gerald & Egger, Josef. (U Graz, Inst of Psychology, Austria) *[The acquisition of positive and negative attitudes while facing previously neutral persons.]* (Germ) *Zeitschrift für Experimentelle und Angewandte Psychologie*, 1974, Vol 21(1), 132-145. —Investigated the acquisition of positive and negative attitudes toward unknown and neutral persons during agreeable and disagreeable situations. 60 male students were confronted with different problem-solving tasks. In addition to the E, a silent O was present during the sessions. Afterwards, Ss were asked to evaluate the O who had left the room, with the help of scales of personality characteristics. Ss who had experienced successes during the problem-solving session evaluated the absent O as more sympathetic than did Ss who had experienced failure. Rejection of the O was particularly strong when the apparent "disorganization" of the E had

clearly caused S's failures. (English & French summaries) (19 ref)—*W. J. Koppitz*.

5218. Mishara, Brian L. et al. (Socio-technical Systems Assn, Boston, MA) *Encroachments upon the body buffer zones of the young and old woman: A naturalistic study*. *International Journal of Aging & Human Development*, 1974(Win), Vol 5(1), 3-5. —Adapted the methodology of body buffer zone research to explore intergenerational spatial proximity behavior in 30 young women (18-25 yrs) and 30 old women (over age 60) whose body buffer zones were violated by another old or young person. Results suggest that people tend to tolerate longer intrusions on their body buffer zones when the intruder is of the same generation than when the person moving into "their space" is of a different generation. —*A. J. Traxler*.

5219. Newman, Graeme R. (State U New York, School of Criminal Justice, Albany) *Acts, actors, and reactions to deviance*. *Sociology & Social Research*, 1974(Jul), Vol 58(4), 434-440. —Determined whether the actor or the act is crucial in establishing reactions to deviance. Reactions to several kinds of deviant behavior were studied by questionnaires given to 79 undergraduates. Descriptions of acts were varied to show "good," "bad," or "unspecified" actors. The acts of taking marijuana, incest, and evading taxes were not affected by actor characteristics, while the acts of homicide, homosexuality, and pollution were affected, although these differed according to the kind of reaction measured. —*R. V. Heckel*.

5220. Nowicki, Stephen; Nelson, Don A. & Estinger, Ronald F. (Emory U) *The role of need for social approval in initial attraction*. *Journal of Social Psychology*, 1974(Oct), Vol 94(1), 149-150. —Ss completed the Marlowe-Crowne Social Desirability Scale (MCSD) which measured the need for approval and provided the stimulus for proportion of similarity. Results show that the degree of MCSD score significantly affected attraction when the proportion of item agreement (PIA) was 75% but not 50%. High and low MCSD scores were more attracted to strangers who expressed 75% PIA than were middle scorers.

5221. Poivyac, Emil J. & McKillop, Jack. (Loyola U, Chicago) *The set size effect and confidence in reports of behavioral intentions*. *Psychonomic Science*, 1972(Oct), Vol 29(2), 94-96. —Explored the generality of the principles of impression formation, using marital and employment behavioral intentions of 186 undergraduates in a design controlling 4 levels of description (politeness and 3 levels of set size). In addition, several hypotheses were tested relating confidence in the behavioral intention rating to polarity and amount of information presented. In general, findings parallel those obtained when standard evaluative judgments are requested. The reports of confidence increased as polarity and amount of information increased. Some differences in marital and employment behavioral intentions were noted. —*Journal abstract*.

5222. Quarachi, M. Y.; Leggio, Anne H. & White, Frederick W. (Marquette U) *Some biosocial determinants of interpersonal perception*. *Journal of Social Psychology*, 1974(Aug), Vol 93(2), 229-244. —Judgments of 14 stimuli (self and 13 prominent others) on a

personality dimensions were secured from 144 Ss, equally divided between the sexes, 2 age levels (17 and 20 yrs) and 2 IQ groups. Multivariate analysis of variance indicated that (a) there were significant ( $p < .001$ ) age differences in esteeming others, (b) persons of high intelligence generally held others in low esteem, (c) females had a tendency to rate others favorably, (d) females tended to be more discriminating than males in judging others' unhappiness, and (e) when variance-covariance matrices were used to index perceptual differentiation, significant differences ( $p < .05$ ) existed between the age groups and high- and low-IQ Ss for a number of persons judged. (28 ref)—*Journal abstract*.

5223. Rees, David W.; Williams, Lynn & Giles, Howard. (University Coll. Cardiff, Wales) Dress style and symbolic meaning. *International Journal of Symbolic Interaction*, 1974(Mar), Vol 5(1), 1-8. Conducted a study with 60 British undergraduates to determine the symbolic meaning of the tie. A male student (the stimulus person) was observed by Ss, wearing or not wearing a tie, supposedly proceeding either to an interview or to a tutorial. Ss were then unexpectedly asked to evaluate this person along certain personality dimensions. It was found that when the stimulus person was wearing a tie, he was rated significantly as more intelligent, ambitious, serious, and conservative but less open-minded than when he did not wear a tie; social situation also had an influence on Ss' evaluations. Results suggest that the symbolic nature of dress styles may be multidimensional, dynamic, and dependent on the specific social group concerned. *Journal abstract*.

5224. Reich, John W. (Arizona State U) Involvement and response language effects in attitude scaling. *Journal of Experimental Social Psychology*, 1974(Nov), Vol 10(6), 572-584. Developed an analytic procedure for separating the effects of involvement from the number of response language categories S employs in judging a set of sentence stimuli. The procedure treats category usage as an independent variable and an aspect of S's response language. In 2 experiments with a total of 60 undergraduates, category usage was shown to have significant influence on several attitudinal judgment processes including informational complexity, mean judgment functions, and a successive intervals analysis testing I. I. Thurstone's assumption of the effect of involvement on equal category spacing. The decrement in scale responding typically associated with involvement depended on category usage operating either singly or in interaction with involvement. (24 ref)—*Journal abstract*.

5225. Rodin, Miriam. (California State U, San Diego) A further look at social desirability. *Psychonomic Science*, 1972(Oct), Vol 29(2), 103-105. Suggests that although the pervasiveness of social-desirability (SD) responding on self-report instruments has been apparently demonstrated, the generality of this finding may be partly an artifactual result of the methodology used. Studies directed to this question have used self-report instruments with 2 characteristics in common, personal-social adjustment content and 2-choice formats. Both of these characteristics would be expected to heighten SD responding, since adjustment items are explicitly coded for SD in the culture, and since in 2-choice formats Ss cannot readily disclaim the (higher) SD alternative

without incriminating themselves. In the present study with a total of 45 Ss, the instrument used differed in both respects. The item format was multiple choice, and the item contents were situationally defined behaviors shown to be not explicitly coded for SD in the culture. 21 Ss were asked to make "typical," SD, and actual behavior judgments for each of the items and to indicate their confidence in the judgments. The findings were replicated with independent sets of both Ss and items. It is concluded that previous work has overestimated the extent of SD responding over self-report instruments in general. The present items may offer a promising direction for constructing self-report instruments less likely to be affected by the SD set.—*Journal abstract*.

5226. Ryckman, Richard M. & Sherman, Martin F. (U Maine, Orono) Locus of control and perceived ability level as determinants of partner and opponent choice. *Journal of Social Psychology*, 1974(Oct), Vol 94(1), 103-110.—The effects of individual differences in locus of control orientation and perceived ability level on the selection of partners or opponents with superior, equal, or inferior abilities for cooperative or competitive task efforts were examined in 80 female Ss. Results indicate that internals were willing to relinquish much of their personal control over their outcomes by selecting superior partners for cooperative ventures, but only after they had become thoroughly convinced of their own lack of ability on the task. Where they perceived themselves as having good ability, in contrast, internals tended to select partners of equal ability for the anticipated cooperative activities, even though selection of superior-ability partners would have enhanced their teams' chances for success. Some externals tended to select inferior-ability partners under the same conditions thus virtually ensuring defeat for their teams. *Journal abstract*.

5227. Schultz, Charles B. (Trinity Coll, Hartford, CT) The effect of confidence on selective exposure: An unresolved dilemma. *Journal of Social Psychology*, 1974(Oct), Vol 94(1), 64-69.—Tested L. Festinger's (1964) hypothesis that confident individuals will seek discrepant information in an attempt to reduce dissonance. Dissonance was induced by presenting 90 Ss with evidence which contradicted their beliefs as well as evidence which lent support to them. Behavioral measures of selective exposure to and acquisition of discrepant information were obtained. Dogmatism was examined as a variable which may offset some of the effect of confidence on selective exposure. Although confidence was successfully induced, it had no effect on selective exposure. A tendency was obtained for high dogmatism to seek more discrepant information in the "low confidence" condition than in the "high confidence" condition.—*Journal abstract*.

5228. Sechrest, Lee & Flores, Luis. (Florida State U) Surplus and sharing in a prison sample. *Journal of Social Psychology*, 1974(Oct), Vol 94(1), 33-44.—Attempted to determine the relationship between an experimentally produced surplus of a commodity and the willingness of an individual to share that commodity with someone less fortunate. Prison inmates participated in an "experiment" in which they won varying numbers of cigarettes for the same effort, the 3 levels of "surplus" being

approximately 10, 50, or 150 cigarettes. They were then solicited by either a high- or low-status inmate for a donation of cigarettes on behalf of inmates in solitary confinement. Results show that the mean number of cigarettes donated increased with the number available, but the trend was not linear; rather it was decelerated. With number of cigarettes donated considered as a proportion of supply, it was shown that the group with the largest surplus donated a significantly smaller proportion. There was also some evidence that a high-status solicitor produced a higher proportion of donated cigarettes. Results are consistent with other findings and as responsive to reality constraints on giving.—*Journal abstract*.

5229. Sharan M. B. & Karan, Leela W. (Bhagalpur U, Hosp for Mental Diseases, India) **Relationship between prejudice and adjustment.** *Psychologia: An International Journal of Psychology in the Orient*, 1974(Jun), Vol 17(2), 99-102.—Formulated 2 hypotheses: (a) Prejudice and adjustment are negatively correlated; (b) Individuals who are poorly adjusted score higher in prejudice than those who are well adjusted. Ss were 50 male and 50 female college students. All were given the Revised Prejudice Scale and a 90-item Hindi adjustment inventory. A significant correlation of  $-.33$  was obtained between prejudice and adjustment. The 24 best adjusted and the 24 most poorly adjusted Ss differed significantly in their prejudice scores, confirming the 2nd hypothesis. It is felt that these findings are consistent with psychoanalytic theory.—*R. D. Nance*.

5230. Singh, Ramadhar & Memering, Melinda. (Indian Inst of Technology, Kanpur) **Trait repetition and interpersonal judgement.** *Journal of Social Psychology*, 1974(Oct), Vol 94(1), 151-152.—Investigated the effect of trait repetition and size of descriptive sets on impression judgment in 44 Ss. Results suggest that repetition of a trait adds a negative meaning to both the positive and negative sets and that trait repetition affects interpersonal judgment in a way different from trait-redundancy and trait-relatedness.

5231. Snyder, Melvin & Jones, Edward E. (Duke U) **Attitude attribution when behavior is constrained.** *Journal of Experimental Social Psychology*, 1974(Nov), Vol 10(6), 585-600.—Conducted 5 experiments with a total of 374 undergraduate who were asked to attribute attitudes to target persons on the basis of opinion statements written under high constraints (i.e., the target persons were instructed to prepare the statements but were given no choice concerning the position to be endorsed). The statements were those actually written by other Ss in response to no-choice instructions. Even though the Ss as attributors were well aware of these instructions, and had complied to the same instructions as target persons, attitudes in line with expressed opinions were attributed. In the final experiment, constraints were strengthened even further by the provision of specific arguments that had to be included in the opinion statements. Here the "over attribution effect" finally fell below significance. Results provide further evidence that people tend to make dispositional attributions to "explain" behavior, underestimating the role of environmental constraints.—*Journal abstract*.

5232. Switkin, Linda R. & Gynther, Malcolm D. (St Louis U) **Trust, activism, and interpersonal perception in black and white college students.** *Journal of Social Psychology*, 1974(Oct), Vol 94(1), 153-154.—An analysis of variance of the trust scores of 69 active and nonactive students on the Rotter's Interpersonal Trust Scale shows that blacks obtained lower trust scores than whites, active blacks obtained significantly lower trust scores than nonactive blacks, and active whites' trust scores were essentially the same as those of inactive whites. Race was also a significant factor in scores of trust attributed to the opposite race.

5233. Thomas, Margaret H. & Tell, Phillip M. (Florida Technological U) **Effects of viewing real versus fantasy violence upon interpersonal aggression.** *Journal of Research in Personality*, 1974(Aug), Vol 8(2), 153-160.—Of 96 male undergraduates, 32 Ss saw a violent film which they were told represented a real event, 32 saw the same film presented as a fictional event, and the remaining Ss saw no film. 16 Ss in each group had been attacked previously by a confederate while the others had not. Each S was then given an opportunity to aggress against the confederate by administering shocks to him as punishment in a learning task. Results indicate that Ss who observed real violence delivered stronger shocks to the confederate than Ss who viewed fantasy violence or saw no film. Ss who were angered and saw the real film were the most punitive toward the confederate.—*Journal abstract*.

5234. Topalova, Velina. (U Warsaw, Inst of Psychology, Poland) **Credibility of information source.** *Polish Psychological Bulletin*, 1974, Vol 5(2), 73-80.—Tested the influence of 3 factors on communicator credibility—communicator's attractiveness, communicator's expertness, and discrepancy between communicator's and recipient's opinions—upon change of the latter's opinion and upon his assessment of communicator's expertness and attractiveness. Communicator's attractiveness was manipulated by describing communicator as either very similar or very dissimilar to the Ss, 160 Polish female undergraduates. On each of 4 conditions half of the Ss were confronted with a large discrepancy in opinion and the other half with a small discrepancy. Results show that a greater change in recipient's opinion toward communicator's opinion occurred with a marked initial discrepancy in opinion and with recipient's recognition of communicator's expertness. The same 2 variables influenced recipient's assessment of communicator's credibility. (24 ref)—*Journal abstract*.

5235. Touhey, John C. (Florida Atlantic U) **Situated identities, attitude similarity and interpersonal attraction.** *Sociometry*, 1974(Sep), Vol 37(3), 363-374.—Studied the attitude similarity-interpersonal attraction paradigm from the standpoint of C. N. Alexander's situated identity theory. 180 undergraduates acting as Os predicted P's attraction to 0 for 3 proportions of similar attitudes and ascribed personality traits as explanations of 5 orthogonally varied ratings of P's attraction to 0. Findings of the attraction paradigm were accurately simulated. In addition, Ss' ratings of their own attraction to P and the favorability of P's situated identity were highest for the predicted outcomes. Comparisons among the most frequently ascribed traits revealed 2 internally

consistent sets of undesirable personality attributions to P's who displayed inappropriately high or low ratings of attraction for specific proportions of similar attitudes. (21 ref)—*Journal abstract.*

5236. Truzzi, Marcello. (New Coll) **The problem of relevance between orientations for cognitive dissonance theory.** *Journal for the Theory of Social Behaviour*, 1973(Oct), Vol 3(2), 239-247.—Critiques balance theories (i.e., cognitive consistency theories) of attitude change because they fail to seriously consider a theoretical issue before model construction: the problem of relevance between attitudes. Since determination of whether objects of orientation will or will not be covered by a dissonance or cognitive consistency model depends on first ascertaining whether they are relevant or irrelevant to one another, this constitutes a central problem for any such formulations. 3 types of relevance are discussed: logical, cultural, and instrumental relevance. These forms are considered to be both psychological and sociocultural and should be applied to both fields of study. (22 ref)—*R. S. Albin.*

5237. Turner, Barbara F. & Turner, Castelleno B. (U Massachusetts, Amherst) **The political implications of social stereotyping of women and men among black and white college students.** *Sociology & Social Research*, 1974(Jan), Vol 58(2), 155-162.—Administered semantic differential scales on the concepts "most women are . . ." and "most men are . . ." to 28 black female, 31 black male, 45 white female, and 37 white male undergraduates. White females were the only group to rate the opposite sex significantly more positively than their own sex. Black females rated men as more unreliable than did the other groups and were the only group to rate men as significantly more unreliable than they rated women. Otherwise, black females' evaluations of men did not differ from male evaluations. (16 ref)—*Journal abstract.*

5238. Westbrook, Mary. (Macquarie U, North Ryde, NSW, Australia) **Sex differences in the perception of emotion.** *Australian Journal of Psychology*, 1974(Aug), Vol 26(2), 139-146.—While overall sex differences in sensitivity to emotion have rarely been found, it has been proposed that Ss' sex may be a significant interactional variable. 9 hypotheses were tested, examining sex differences in (a) accuracy of judgment of emotion, (b) attention paid to emotional cues, and (c) type of error made when incorrectly judging emotions, when these variables are related to (d) the emotions being expressed and (e) the sex of the expressor. Little evidence of sex differences was found from testing 49 male and 51 female 18-50 yr old Ss. Males made more evaluative errors when judging positive and negative emotions as expressed by females. Continued research emphasis on sex differences in the perception of emotion is questioned.—*Journal abstract.*

5239. Worchel, Stephen & Arnold, Susan E. (U North Carolina, Chapel Hill) **The effect of combined arousal states on attitude change.** *Journal of Experimental Social Psychology*, 1974(Nov), Vol 10(6), 549-560.—67 undergraduates either were given a choice or no choice to listen to a counter-attitudinal communication. For half the Ss (Interrupt condition) the tape of the communication broke during the concluding sentence of the speech.

The other half (No Interrupt condition) heard the speech in its entirety. A recall measure indicated that Ss in the Interrupt condition recalled significantly more arguments made in the communication than Ss who heard the complete speech. Consistent with dissonance theory, greater attitude change toward the position of the speech occurred in Ss given a choice than in Ss given no choice. Significantly greater change occurred in the Choice-Interrupt condition than any of the other conditions. (21 ref)—*Journal abstract.*

## COMMUNICATION AND LANGUAGE

5240. ———. **Conference on cutaneous communication systems and devices.** Austin, TX: Psychonomic Society, 1974. vi, 112 p.

5241. Ainsworth, W. A. (U Keele, England) **Performance of a speech synthesis system.** *International Journal of Man-Machine Studies*, 1974(Sep), Vol 6(5), 493-511.—Describes a system for synthesizing speech from a phonetic input. A string of phonetic symbols representing the sentence to be uttered is transformed into the control signals required by a parametric speech synthesizer using a small digital computer. Performance tests with 20 listeners resulted in ready identification of vowels, less identification of fricatives, and 90% identification of words.

5242. Arnheim, Rudolf. (Harvard U) **Art and visual perception: A psychology of the creative eye.** (New version). Berkeley, CA: University of California Press, 1974. x, 508 p. \$15.

5243. Baran, Stanley J. & Meyer, Timothy P. (Cleveland State U) **Imitation and identification: Two compatible approaches to social learning from the electronic media.** *AV Communication Review*, 1974(Sum), Vol 22(2), 167-179.—Compares the learning theory of A. Bandura (a stimulus-stimulus contiguity nonreinforcement view) with that expressed by H. B. and J. L. Gewirtz (a stimulus-response instrumental learning approach). A synthesis of the 2 theories (identification and generalization beyond specific acts) is proposed and the importance of this synthesis for the field of educational technology and mass communication research is examined. (25 ref)

5244. Blau, Judith R. (Baruch Coll, City U New York) **Patterns of communication among theoretical high energy physicists.** *Sociometry*, 1974(Sep), Vol 37(3), 391-406.—Used data from an international sample of theoretical high energy physicists to study similarities and differences in individual and contextual characteristics of pairs of consultants. Except for country, the attribute most likely to be shared by a consulting dyad is speciality. Communication links across and within specialties and across status differences are described, and it is suggested that the minute division of labor is the source of universalism in science. (16 ref)

5245. Blumberg, Herbert H.; Fuller, Carolyn & Hare, A. Paul. (U London, Inst of Psychiatry, England) **Response rates in postal surveys.** *Public Opinion Quarterly*, 1974(Spr), Vol 38(1), 113-123.—Considers a variety of recommendations for improving low return rate on mail surveys. Several procedures are evaluated

for their effectiveness: guaranteed return postage, format of cover letter, prestige of sponsor, length of survey, anonymity, premiums or gifts for return of the survey, and reminders. (30 ref)

5246. Cairns, Helen S.; Cairns, Charles E. & Williams, Fredrick. (City U New York) **Some theoretical considerations of articulation phenomena.** *Language & Speech*, 1974(Apr-Jun), Vol 17(2), 160-173.—Articulation substitutes in the speech samples of American 1st-6th graders, representing standard American English, Black English, and Spanish-influenced English ( $n = 198, 192$ , and  $192$ , respectively), were analyzed using a distinctive features approach. Results indicate that beyond variations due to dialect and 2nd-language influences, most substitutions could be predicted from phonemic complexity criteria developed from phonological theory. Markedness theory is demonstrated as a basis of predicting the phonetic feature characteristics of substitutions.—*Journal abstract*.

5247. Callary, R. E. (Northern Illinois U) **Status perception through syntax.** *Language & Speech*, 1974(Apr-Jun), Vol 17(2), 187-192.—Previous studies have indicated that untrained judges are able to assign correct social status to a speaker on the basis of a very short sample of speech. However, it is unknown if the linguistic features upon which these decisions are based are to be found in the syntactic, phonological, or morphological components of the grammar. The present study held phonology and morphology constant and examined status judgments of 76 undergraduate Ss, based entirely upon syntax. Findings indicate that judges were consistently able to assign correct social status on the basis of syntax alone.—*Journal abstract*.

5248. Chebat, Jean-Charles. (U Québec, Montréal, Canada) **Symbol: Towards a definition.** *International Journal of Symbolism*, 1974(Mar), Vol 5(1), 31-39.—Argues that the term "symbol" has been outrageously misused and that it would be useful to distinguish it by opposition to concepts with which it has been confused (e.g., allegory, myth, metaphor, and sign). Psychological, linguistic, and historical differences in these terms are cited, and the idea that symbolic communication characterizes society's tolerance level for individuals and its ability for abstract representation is examined. (French abstract)

5249. Crowley, Francis E. (State U New York, Buffalo) **Epiphany in Phoenix Park: A psychoanalytic look at a Dubliner.** *Psychoanalytic Review*, 1974(Spr), Vol 61(1), 63-70.—An analysis of Duffy, the character in J. Joyce's "A Painful Case," points to the identification of sex, sin, and death in Duffy's relation with Mrs. Sinico.

5250. de Villiers, Peter A. (Harvard U) **An effect of the definite article on the salience of a noun.** *Language & Speech*, 1974(Apr-Jun), Vol 17(2), 135-141.—Asked 62 English-speaking undergraduates to correct the meaning of semantically anomalous sentences in which a noun, either the subject or object, or the verb could be considered anomalous. Increased specificity of reference led to an increase in the salience of the nouns in the meaning of the sentences. A noun was significantly more likely to be retained in the corrections and the verb considered anomalous if that noun was definite than if it was indefinite. Subject nouns were also more likely to be retained than were object nouns when they broke the

selection restrictions of the verb. This finding is discussed in terms of other studies showing the importance of the subject noun in sentence comprehension.—*Journal abstract*.

5251. Dever, Richard B. (Indiana U) **Discussion summary: Nonspeech communication.** In R. L. Schiefelbusch & L. L. Lloyd (Eds), *Language perspectives: Acquisition, retardation, and intervention*. Baltimore, MD: University Park Press, 1974. xv, 670 p; \$14.50.—Critically reviews articles by D. Premack (see PA, Vol 53:Issue 3) and D. F. Moore (see PA, Vol 53:Issue 3) on nonvocal language. (18 ref)

5252. Eisinger, Richard A.; Janicki, W. Peter; Stevenson, Robert L. & Thompson, Wendel L. **Increasing returns in international mail surveys.** *Public Opinion Quarterly*, 1974(Spr), Vol 38(1), 124-130.—Reports on studies undertaken to increase the response and lower the cost of international mail surveys. The procedures discussed are the use of registered mail, sending advance postcards, rewards, and follow-up mailings.

5253. Francis, Hazel. (U Leeds, England) **Social class, reference and context.** *Language & Speech*, 1974(Apr-Jun), Vol 17(2), 193-198.—In samples of 96 5-7 yr old children of social class 1-3 and 96 of social class 4-5, no significant differences were found in the use of nominal group items nor in exophoric reference in a story reproduction task. Results, which appear to contradict P. R. Hawkins's (1969) findings in a picture description task, are discussed with reference to B. Bernstein's (1972) notions of restricted and elaborated codes and W. Labov's (1966) studies of language in social contexts. It is concluded that different codes are available and used for reference in different contexts and that this has particular significance for education.—*Journal abstract*.

5254. Friedrich, Lynette K. & Stein, Aletha H. (Pennsylvania State U) **Aggressive and prosocial television programs and the natural behavior of preschool children.** *Monographs of the Society for Research in Child Development*, 1973, Vol 38(4, Serial No 151), 63 p.—93 children in a 9-wk nursery school session were shown 1 of 3 types of TV programs each day during the middle 4 wks of the session: aggressive cartoons, prosocial programs, and neutral films. The effects of the programs were assessed by the changes in behavior that occurred from the baseline period to the periods during and after exposure to the programs. Ss who saw the aggressive programs showed a decline in tolerance of delay and rule obedience. Aggressive programs increased aggressive behavior only in Ss who initially ranked higher in aggression. Ss exposed to the prosocial programs showed higher levels of task persistence and somewhat higher levels of rule obedience and delay tolerance than those in the neutral condition. These differences were especially pronounced for children with above-average intelligence. Prosocial behavior increased after exposure to the prosocial program for Ss of lower socioeconomic status, but not for those of higher status. Neither attention to the programs nor knowledge about their content was consistently related to behavior change. Home viewing patterns did not predict baseline behavior.—A. Barclay.

5255. Gilbert, Harvey R. & Weismer, Gary G. (Pennsylvania State U, Speech & Hearing Clinic) **The**

**effects of smoking on the speaking fundamental frequency of adult women.** *Journal of Psycholinguistic Research*, 1974(Jul), Vol 3(3), 225-231.—Results of a study of 30 30-54 yr old women indicate that, in the reading condition, speaking fundamental frequency for the smokers was significantly lower than fundamental frequency for the nonsmokers. 87% of the smokers examined by an otolaryngologist exhibited some abnormality in appearance of the vocal folds. Results also suggest that menopause may contribute to a lowering of the speaking fundamental frequency of adult women. (22 ref)—*Journal abstract*.

5256. **Goldberg, Marvin E. & Gorn, Gerald J.** (McGill U, Montreal, Quebec, Canada) **Children's reactions to television advertising: An experimental approach.** *Journal of Consumer Research*, 1974(Sep), Vol 1(2), 69-75.—Examined both the effects of a child's expectancy of receiving a toy and the number of TV commercials he sees for the toy. In a  $3 \times 3$  factorial design, 133 8-10 yr old boys were presented with low, moderate, or high expectancies of obtaining a toy, followed by 0, 1, or 3 exposures to a TV commercial for the toy. Results indicate that seeing a single commercial for a valued toy produced more favorable reactions to the toy and increased motivated behavior to obtain it, but further exposure to commercials did not increase these effects. As hypothesized, both the value of the product and persistence behavior were a function of exposure to the commercial. Data confirm the hypothesis that the effect of commercials on attitude and behavior is most pronounced with 1 exposure and is consistent with empirical and theoretical findings of satiation effects. (25 ref)—*L. Gorsey*.

5257. **Harman, Gilbert (Ed.)**. (Princeton U) **On Noam Chomsky: Critical essays.** Garden City, NY: Anchor, 1974. xii, 348 p. \$4.95.—Presents a collection of 17 papers on N. Chomsky's theories of language. Contributors include specialists in the fields of philosophy, linguistics, psychology, and anthropology.

5258. **Henderson, Alan I.** (U Southampton, England) **Time patterns in spontaneous speech: Cognitive stride or random walk? A reply to Jaffe, et al (1972).** *Language & Speech*, 1974(Apr-Jun), Vol 17(2), 119-125.—Argues that on-off time patterns may serve to identify speech encoding units. An explanation in terms of random processes is best regarded as a null hypothesis. It is not in itself sufficient grounds for rejecting an encoding processes interpretation, as in J. Jaffe et al (see PA, Vol 49:2409). (19 ref)

5259. **Hensley, Wayne E.** (U Indiana) **Increasing response rate by choice of postage stamps.** *Public Opinion Quarterly*, 1974(Sum), Vol 38(2), 280-283.—Examined the technique of increasing response rate to mail surveys by using multicolored commemorative postage stamps. It is concluded that this does increase the return when certain combinations of stamps are used. Results are explained on the basis of the novelty hypothesis.

5260. **Jacoby, Jacob.** (Purdue U) **The construct validity of opinion leadership.** *Public Opinion Quarterly*, 1974(Spr), Vol 38(1), 81-89.—Applied 3 basic techniques of measuring opinion leadership (self-designating, sociometric, and key informant) to 4 cohesive groups in an effort to establish the construct validity of opinion

leadership with respect to clothing, alcoholic beverages, long-playing records, cosmetics, and room decorations. Results show that overlap in opinion leadership did exist across product categories, and that there was a substantial degree of "observational" construct validity for the notion of opinion leadership for the 3 measures selected. (26 ref)—*M. K. Phifer*.

5261. **Jones, Pauline A.** (Memorial U Newfoundland, St John's, Canada) **Elaborated speech and hesitation phenomena.** *Language & Speech*, 1974(Apr-Jun), Vol 17(2), 199-203.—Examined speech characteristics of 2 groups who were discrepant in verbal ability and who were from families differing in press for language development. The sample consisted of 25 pairs of male 5th graders who were matched for general intelligence. Transcripts of Ss' oral responses to stimulus pictures were analyzed, yielding 13 speech variables. High-verbal as compared with low-verbal Ss used more and longer communication units, had a higher index of subordination, and used more tentative statements. Ss having higher verbal ability and using more elaborated speech nevertheless had a shorter mean pause duration and paused less frequently than low-verbal Ss. Findings raise questions concerning the relevance of hesitation phenomena for verbal planning activity accompanying speech.—*Journal abstract*.

5262. **Kent, Raymond D.; Carney, Patrick J. & Severeid, Larry R.** (U Wisconsin, Madison) **Velar movement and timing: Evaluation of a model for binary control.** *Journal of Speech & Hearing Research*, 1974(Sep), Vol 17(3), 470-488.—Used cinefluorographic analyses of the articulatory movements of 2 speakers to evaluate a binary model of velar control. It is argued that the binary control model does not survive rigorous empirical test because (a) it makes some predictions that are inappropriate for American English and (b) the confirmation criteria used in previous reports were applied inconsistently. It is suggested that if binary control models are used in making predictions about the timing of articulations, the binary feature values should be interpreted by means of a systematic phonetics or an elaborated speech production model. Sequences of articulatory movements may be organized in a hierarchical fashion, such that neuromotor instructions from the motor command system often are issued simultaneously for the tongue, velum, lips, and jaw, even though the commands may not always apply to the same phonetic segment. (16 ref)—*Journal abstract*.

5263. **Leifer, Aimee D.; Gordon, Neal J. & Graves, Sherryl B.** (Harvard U, Graduate School of Education, Ctr for Research in Children's Television) **Children's television: More than mere entertainment.** *Harvard Educational Review*, 1974(May), Vol 44(2), 213-245.—Reviews the literature regarding the effects of TV content on children's aggressive and prosocial behavior and on their social attitudes. It is indicated that TV does appear to influence attitudes, and this socializing power should be used constructively. However, examination of the structure of the American TV industry indicates that economic factors outweigh public concern in the choice of programming. The beneficial effects of TV could be enhanced by greater diversity of televised content and by more parental direction of children's exposure to this

content, but it is unknown to what extent, and with what outcome parents try to teach children to evaluate TV critically. (76 ref)—C. M. Franks.

5264. Lester, David. (Richard Stockton State Coll) **Symbolism in the Chinese language.** *International Journal of Symbolology*, 1974(Mar), Vol 5(1), 18-21.—Determined whether evidence could be obtained for graphic and tonal symbolism in the Chinese language in addition to the evidence obtained in previous studies for phonetic symbolism. Data from 44 undergraduates show no evidence of graphic or tonal symbolism, indicating that the symbolic aspects of language may be limited to phonetic aspects.

5265. Levelt, W. J. **Formal grammars in linguistics and psycholinguistics: I. An introduction to the theory of formal languages and automata.** The Hague, Netherlands: Mouton, 1974. x, 143 p.

5266. Levelt, W. J. **Formal grammars in linguistics and psycholinguistics: II. Applications in linguistic theory.** The Hague, Netherlands: Mouton, 1974. viii, 194 p.

5267. Lindauer, Martin S. (State University Coll New York, Brockport) **The psychological study of literature: Limitations, possibilities, and accomplishments.** Chicago, IL: Nelson-Hall, 1974. xiii, 254 p. \$11.

5268. Markiewicz, Dorothy. (Northern Illinois U) **Effects of humor on persuasion.** *Sociometry*, 1974(Sep), Vol 37(3), 407-422.—Used an information-processing framework to review the literature on the effects of humor on the attitude change process. Findings show that (a) humor integral to or adjacent to a persuasive message does not influence persuasion significantly, (b) humor's effects on comprehension and source evaluations are inconsistent, and (c) retention does not appear to be altered by humor usage. Severe methodological problems with prior research include inadequate control messages, questionable humor manipulations, inappropriate settings for receipt of humor, limited S populations, and blatant demand characteristics. Many of these problems plague persuasion research in general. 2 theoretical approaches, learning theory and distraction effects, offer requisite guidance for future investigators. (45 ref)—*Journal abstract*.

5269. Matsuoka, Takeshi & Ono, Tamaki. [A study of aspects of the historical changes in the present senior and junior high school student's way of cognition and feeling.] (Japn) *Japanese Journal of Educational Psychology*, 1973(Sep), Vol 21(3), 177-180.—Administered the color Symbolism Test to 200 middle and high school Ss and compared the responses with those obtained from similar age groups 20 yrs ago, to find difference in affective meaning between the 2 generations. Results show that the younger generation preferred brighter colors.

5270. Matteson, Michael T. (U Houston) **Type of transmittal letter and questionnaire color as two variables influencing response rates in a mail survey.** *Journal of Applied Psychology*, 1974(Aug), Vol 59(4), 535-536.—Mailed questionnaires to 2,123 members of a national professional organization. A significantly greater number ( $p < .001$ ) of returns were received from groups receiving a semipersonal letter than groups receiving a form letter. Among the groups receiving the

form letter a significantly greater number ( $p < .05$ ) of colored questionnaires were returned than white questionnaires.

5271. McDowall, Joseph J. (U Queensland, St Lucia, Australia) **The reliability of ratings by linguistically untrained subjects in response to stress in speech.** *Journal of Psycholinguistic Research*, 1974(Jul), Vol 3(3), 247-259.—To determine the reliability with which untrained raters could identify stress in the speech of a single person, 2 forms of the same material, speech broken into short utterances and speech in its conversational context, were presented to 40 linguistically naive psychology students who were asked to underline those syllables that they perceived as stressed. High reliabilities were obtained from both interrater measures ( $r = 0.96$  for each treatment) and a test-retest estimate ( $r = 0.88$ ). However, significantly larger total stress scores were recorded under the short utterance presentation than under the context condition. It is suggested that this result occurred because each of the few syllables in short utterances received greater attention than did the stream of syllables in context. Subsequent regression analysis led to the prediction that, for a short passage to attain a mean score equal to that which it would receive if rated in context, it should contain approximately 40 syllables. (26 ref)—*Journal abstract*.

5272. Miller, Gerald R. & Simons, Herbert W. (Eds.). (Michigan State U) **Perspectives on communication in social conflict.** Englewood Cliffs, NJ: Prentice-Hall, 1974. xiii, 257 p.

5273. Moores, Donald F. (U Minnesota, Research, Development & Demonstration Ctr in Education of Handicapped Children) **Nonverbal systems of verbal behavior.** In R. L. Schiefelbusch & L. L. Lloyd (Eds.), *Language perspectives: Acquisition, retardation, and intervention*. Baltimore, MD: University Park Press, 1974. xv, 670 p \$14.50.—Suggests that the resilience and endurance of manual communication systems are indications that they are meeting an unmet need. Experience with deaf children and adults is cited in support of this view. (3 p ref)

5274. Ochsman, Robert B. & Chapanis, Alphonse. (U Arkansas, Little Rock) **The effects of 10 communication modes on the behavior of teams during co-operative problem-solving.** *International Journal of Man-Machine Studies*, 1974(Sep), Vol 6(5), 579-619.—60 teams of 2 male undergraduates each solved credible "real world" problems cooperatively. Conversations were carried on in 1 of 10 modes of communication: typewriting only, handwriting only, handwriting and typewriting, typewriting and video, handwriting and video, voice only, voice and typewriting, voice and handwriting, voice and video, and a "communication-rich mode." Performance was assessed on 3 classes of dependent measures: time to solution, behavioral measures of activity, and linguistic measures. Significant and meaningful differences among the communication modes were found in each of the 3 classes of dependent variable. Behavior was recorded in 21 different categories from which 3 additional composite categories were formed. The analyses of the behavioral data yielded 51 statistically significant terms. Data support the conclusion that the single most important decision in the design of a telecommunications link

should center around the inclusion of a voice channel.  
—*Journal abstract.*

5275. Papich, George & Rainbow, Edward. (North Texas State U) **A pilot study of performance practices of twentieth-century musicians.** *Journal of Research in Music Education*, 1974(Spr), Vol 22(1), 24-34.—Carried out graphic analyses of recordings of 4 violin, 4 cello, and 5 double bass students. Pitch vibrato was present in the initial attack of all tones. When each performer used vibrato, the speed of the vibrato and pitch width were the same in solo playing as in ensemble playing. Pitch vibrato appeared to be an oscillation in an upward direction from conceived pitch rather than above and below it. When performers erred in going from a lower pitch note to a higher note, the error tended to be an overestimation of the interval. Comparisons of solo with ensemble performances indicate that solos tended to be slightly sharper in pitch, and that pitch adjustments in ensemble performances tended to be downward.—D. S. Higbee.

5276. Power, Joseph P. (Moreno Inst, New York, NY) **The theatre of the Catholic Church, its roots and relationship to psychodrama.** *Handbook of International Sociometry*, 1973, Vol 7, 55-59.—Presents a historical summary of the use of the dramatic medium by the Catholic Church since the early Middle Ages. The Church is criticized because it has chosen to focus on the conserved product or completed script to promulgate the Christian message and has provided little opportunity for the creative and spontaneous contributions of those persons who strive to live out that message. 10 ways in which the Church might redefine its use of the dramatic medium and utilize creativity and spontaneity are listed, each within a sociometric framework.—R. J. Ambrosino.

5277. Ramsey, Craig A. & Wright, E. N. (Board of Education, Toronto, Ontario, Canada) **Age and second language learning.** *Journal of Social Psychology*, 1974(Oct), Vol 94(1), 115-121.—Describes a study of 5th, 7th, and 9th grade "new Canadians" on the relationship between age on arrival and achievement in English language skills. Results show that Ss who arrived at 6-7 yrs or younger performed close to average, and that there was no relationship between age on arrival and performance. The average scores for Ss who arrived at an older age progressively dropped, and correlations indicated a modest relationship between age on arrival and test scores. Thus while all recent arrivals have initial difficulties in learning the language, it appears that over time age on arrival is the critical variable. This provides indirect support for the position that there is a critical age for optimum instruction in a 2nd language. The evidence is less clear for 1 of the 7 language measures—intonation.—*Journal abstract.*

5278. Ramstad, Vivian V. & Potter, Robert E. (Richmond Unified School District, CA) **Differences in vocabulary and syntax usage between Nez Perce Indian and white kindergarten children.** *Journal of Learning Disabilities*, 1974(Oct), Vol 7(8), 491-497.—Through the use of the Peabody Picture Vocabulary Test and the Northwestern Syntax Screening Test, this study sought to determine if there were significant differences between 21 Nez Perce Indian and 21 white kindergartners in their use of receptive vocabulary and receptive and expressive

syntax. The study also attempted to determine if there were any significant differences between receptive vocabulary and receptive syntax and between receptive and expressive syntax within each population. Significant differences were found between the 2 populations in all 3 tasks measured. It is suggested that this investigation has implications for educational strategy, as well as for further language evaluational and instructional considerations. (20 ref)—*Journal abstract.*

5279. Robertson, Thomas S. & Rossiter, John R. (U Pennsylvania, Wharton School) **Children and commercial persuasion: An attribution theory analysis.** *Journal of Consumer Research*, 1974(Jun), Vol 1(1), 13-20.—Studied children's levels of understanding of TV commercials and the associated effects upon attitudes and purchase request tendencies. Attribution theory, with its focus on perception of intent, was the research framework. Results suggest that when a child attributes persuasive intent to commercials, he believes them less, likes them less, and is less likely to want the products advertised. (19 ref)—*Journal abstract.*

5280. Rosenbaum, Bent. (Bispebjerg Hosp, Dept of Psychiatry, Copenhagen, Denmark) **[Semiotics and psychiatry.]** (Danh) *Nordisk Psykiatrisk Tidsskrift*, 1974, Vol 28(2), 83-94.—Discusses the relation between linguistics and psychiatry. Both disciplines concern human communication, but they have remained apart. The linguistic analyses of P. Aa. Brandt are well suited to bridge the gap between the theory of language and psychodynamics. The dual nature of personality is reflected in a dualism of spoken messages; only the latter can be subjected to direct and objective study. A theoretical analysis of schizophrenic language is presented.—R. G. Wikmark.

5281. Rothschild, Michael L. & Ray, Michael L. (Stanford U) **Involvement and political advertising effect: An exploratory experiment.** *Communication Research*, 1974(Jul), Vol 1(3), 264-285.—Data from a laboratory experiment on the relationship among awareness, attitude formation, and intent to behave over several levels of election races and several levels of advertising show that in lower-level elections behavior is easily influenced by a high repetition level of innocuous advertising; this phenomenon does not occur in the higher-level races. Ss were 161 self-selected persons in a shopping center. This change in behavior was accomplished without an accompanying shift in attitude. The shift occurred equally among those Ss who were evaluated as having high involvement with the political process and those evaluated as having low involvement. (34 ref)—*Journal abstract.*

5282. Scherer, Klaus R. (U Giessen, Fachbereich Psychologie, W Germany) **Voice quality analysis of American and German speakers.** *Journal of Psycholinguistic Research*, 1974(Jul), Vol 3(3), 281-298.—Investigated voice-personality relationships and sociocultural and attributional factors affecting voice. 6 phoneticians rated the voices of 26 American and 22 German speakers on 9 voice quality parameters which were discussed and illustrated by tape-recorded examples before the rating sessions. A reliability analysis shows highly significant interrater agreement on most parameters. Intercorrelations of the expert ratings and correlations with lay

ratings of voice are reported and discussed. (29 ref)  
—*Journal abstract.*

5283. Siegel, Arthur I.; Lambert, Joseph V. & Burkett, James R. (Applied Psychological Services, Science Ctr, Wayne, PA) **Techniques for making written material more readable/comprehensible.** *US AFHRL Technical Report*, 1974(Aug), No 74-47, 24 p.—Outlines the application of psycholinguistic and intellectual concepts to enhance the readability and comprehensibility of written materials. Guidelines for making the reader's task easier are provided, and several readability measurement procedures—including use and comprehension tests, the cloze procedure, and element-counting and rating-by-experts techniques—are discussed.—*Journal abstract.*

5284. Sivik, Lars. **Measuring the meaning of colors: Reliability and stability.** *Göteborg Psychological Reports*, 1974, Vol 4(12), 14 p.—Discusses 2 kinds of reliability estimates concerning semantic differential measurements of color connotations: (a) test-retest for the same groups and (b) consistency between groups. Data on stability are presented from a number of different studies. The stability of color connotations seems to depend on the relevance of the scale to the color judged. As a particular scale differs in relevance to different colors, this implies that interaction between scales and concepts affects the reliability. Another interacting factor—interindividual differences in stability of judgment—is demonstrated.—*Journal abstract.*

5285. Spencer, H.; Reynolds, Linda & Coe, B. (Royal Coll of Art, Readability of Print Research Unit, London, England) **Typographic coding in lists and bibliographies.** *Applied Ergonomics*, 1974(Sep), Vol 5(3), 136-141.—Compared the effectiveness of 10 systems of typographical-spatial coding suitable for use in the presentation of highly structured information such as bibliographic material. Results show that the most effective system was a 2-unit left extension of the 1st line of each entry.

5286. Staats, Arthur W. (U Hawaii) **Behaviorism and cognitive theory in the study of language: A neopsycholinguistics.** In R. L. Schiefelbusch & L. L. Lloyd (Eds), *Language perspectives: Acquisition, retardation, and intervention*. Baltimore, MD: University Park Press, 1974. xv, 670 p \$14.50.—Proposes a method of rapprochement between learning approaches and cognitive approaches to the study of language. The background of the schism is reported and central issues are discussed. (3 p ref)

5287. Totman, Richard. (University Coll, London, England) **An approach to cognitive dissonance theory in terms of ordinary language.** *Journal for the Theory of Social Behaviour*, 1973(Oct), Vol 3(2), 215-238.—Responds to a major critique of cognitive dissonance theory: that it is difficult to specify the necessary and sufficient conditions for the occurrence of dissonance and hence the means by which unambiguous predictions can be made. It is suggested that dissonance occurs whenever there is an unresolved "why" question either articulated or implied in a situation. Dissonance theory is seen as having its conceptual roots in the philosophical thesis of the "compatibilism" of free will with determinism. Rules and structure, and the search for them, form the basis for dissonance reduction. (33 ref)—*R. S. Albin.*

5288. Twitchell, James. (U Florida) **"Desire with loathing strangely mixed": The dream work of Christabel.** *Psychoanalytic Review*, 1974(Spr), Vol 61(1), 33-44.—The unfinished poem of Coleridge, *Christabel*, is interpreted as conveying the Oedipal conflict of the author. This theme accounts for the "desire with loathing strangely mixed" and for Coleridge's inability to complete the poem.

5289. Van de Bogart, Erik. (U Maine, Maine Public Broadcasting Network, Orono) **Viewer-active television.** *Educational Technology*, 1974(Mar), Vol 14(3), 37-42.—Describes a series of 5 television programs during which viewers' opinions were employed to modify the program content. The programs dealt with a hypothetical controversial ecology issue regarding a proposed cannery. The programs were broadcast to home viewers and school classes, and supplementary materials were provided to teachers and the public. The specific content of the programs was contingent upon viewers' votes which were solicited after each program in the series.—*C. B. Kreitzberg.*

5290. Wakefield, James A.; Doughtie, Eugene B. & Yom, Byong-Hee Lee. (U Houston) **The identification of structural components of an unknown language.** *Journal of Psycholinguistic Research*, 1974(Jul), Vol 3(3), 261-269.—18 undergraduates attempted to identify structures (words and constituents) in sentences of a foreign language. Ss heard each sentence twice—once with a pause interrupting a structural component and once with a pause separating different structural components. Ss were asked to choose the version that sounded more natural. An experimental group of Ss who had been previously exposed to a spoken passage in the same language as the test sentences was more successful in identifying structures of the sentences than was the control group with previous exposure to another language. This result was interpreted as demonstrating that language structure may be partially acquired during a brief exposure without reliance on meaning. It was also noted that the experimental group identified constituents more accurately than words, suggesting that constituents, more than words, function as acquisitional units of language.—*Journal abstract.*

5291. Ward, Charles D.; Seboda, Barbara L. & Morris, Vernon B. (U Maryland) **Influence through personal and nonpersonal channels of communication.** *Journal of Psychology*, 1974(Sep), Vol 88(1), 135-140.—Conducted a city-wide campaign involving various channels of communication to obtain high school seniors for a survey of occupational decision-making. Of the 102 seniors who telephoned to make appointments, 56 later attended their assigned questionnaire session. The rate of attendance differed for the communication channels. Newspaper advertisements attracted the most telephone calls but had the lowest attendance rate; notices on bulletin boards in city recreation centers produced the fewest telephone calls but had the highest attendance rate. Other channels, including personal contact, were intermediate in effectiveness. Additional findings were that nonpersonal channels differed in influence and that exposure through multiple channels resulted in more influence than exposure through only one channel.

Implications of the findings, especially for conceptualizations of channel influence, are noted.—*Journal abstract.*

5292. Waryas, Carol & Stremel, Kathleen. (U Kansas, Parsons Research Ctr) **On the preferred form of the double object construction.** *Journal of Psycholinguistic Research*, 1974(Jul), Vol 3(3), 271-280.—2 groups of 15 adults participated in 2 preference rating tasks for written sentence forms. Pairs of sentences were presented to the Ss which differed only in the grammatical form used to express the double object construction (one which has both a direct and an indirect object). Several hypotheses were formulated regarding the nature of Ss' preferences for various combinations of grammatical form and "pronominalization." Results indicate that Ss showed clear preferences for one grammatical form in most instances and that rules could be formulated for these preferences. The relevance of these results for the examination of current language assessment tests and the development of language training programs is discussed.—*Journal abstract.*

5293. Weiss, Carol H. (Columbia U, Bureau of Applied Social Research) **What America's leaders read.** *Public Opinion Quarterly*, 1974(Spr), Vol 38(1), 1-22.—Studied the material read by 545 executives of industrial and nonindustrial corporations, government, labor unions, and mass media during 1971-1972. Sizable percentages of all groups read leading newspapers daily as well as weekly news magazines. Professional magazines and trade journals were read regularly by executives in the professions concerned. Media executives and intellectuals read more outside their special interest range. Reading publications with liberal or conservative orientations correlated significantly with executives' attitudes towards civil liberties, foreign policy, social radicalism, economic reform, and economic redistribution.—*M. K. Phifer.*

5294. Welsh, George S. (U North Carolina, Chapel Hill) **Symbolic color/form relationships.** *International Journal of Symbolology*, 1974(Mar), Vol 5(1), 9-17.—Tested the color-form associations postulated by F. Birren (1955) and H. Dreyfuss (1972): square-red, rectangle-orange, inverted triangle-yellow, hexagon-green, circle-blue, oval-purple, diamond-brown, convex-lens-gold, concave-lens-silver, semicircle-white, hourglass-gray, and trapezoid-black. Ss were 220 undergraduates who were either asked to draw forms for 12 given colors or to give colors for 12 given forms. 34 Ss matched colors and forms. Only the triangle-yellow association was supported; this was explained as an association to the traffic "yield" sign. It is suggested that, on the basis of other relatively frequent associations, there may be personality differences in color-form associations and symbolization.—*Journal abstract.*

5295. Woelfel, Joseph; Woelfel, John; Gillham, James & McPhail, Thomas. (Michigan State U) **Political radicalization as a communication process.** *Communication Research*, 1974(Jul), Vol 1(3), 243-263.—Data from 412 adult education students in Canada showed that attitudes toward French Canadian separatism can be accounted for by differential communication processes; attitudes were well explained by a weighted average of the information received from interpersonal and media sources. The resultant attitude showed substantial effects

on behaviors related to separatism for the same respondents. (33 ref)

5296. Wright, Peter L. (U Illinois) **Analyzing media effects on advertising responses.** *Public Opinion Quarterly*, 1974(Sum), Vol 38(2), 192-205.—Analyzes many aspects of media effects on attitudinal responses of audience members. Responses by 160 housewives 25-55 yrs old, from a heterogeneous educational and socioeconomic background, to various types of media presentation supplied data on the following variables: extent of cognitive activity, counterargument, source derogation, supporting argument, message retention, and acceptance of the advertising message.—*M. K. Phifer.*

5297. Ziff, Ruth. **The role of psychographics in the development of advertising strategy and copy.** In W. D. Wells (Ed), *Life style and psychographics*. Chicago, IL: American Marketing Assn, 1974. viii, 363 p.—Discusses the limitations of demographics in advertising and the type of psychographic input most useful in developing an advertising strategy. A communications model of advertising is described, and 2 examples of how life-style and psychographic techniques can assist the creative process are presented.

## PERSONALITY

5298. Abramson, Paul R.; Abramson, Linda C.; Wohlford, Paul & Berger, Stephen E. (Connecticut Coll) **The multidimensional aggression scale for the structured doll play interview.** *Journal of Personality Assessment*, 1974(Oct), Vol 38(5), 436-440.—Constructed a multidimensional aggression scoring system for preschool children's responses to the structured doll-play interview. The system, which incorporates previous investigators' findings, scales doll-play responses along 3 dimensions of aggression: intensity, agent, and directionality. Data were analyzed from responses of 123 black Head Start preschoolers aged 4 yr 9 mo to 5 yr 6 mo. A Spearman rank-order correlation of .92 was obtained with a previous scoring system, while interscorer reliability ranged from .838 to 1.0. The intercorrelative structure of the present scoring system is presented. (16 ref)—*Journal abstract.*

5299. Ansbacher, Heinz L. (U Vermont) **Goal-oriented individual psychology: Alfred Adler's theory.** In A. Burton (Ed), *Operational theories of personality*. New York, NY: Brunner/Mazel, 1974. x, 421 p. \$15.—Examines the background and nature of Adlerian theory and its relationship to Freudian theory. Terminology and definitions are discussed. The theory is applied to the case of Marilyn Monroe to illustrate its concepts and describe a hypothetical treatment. (3½ p ref)

5300. Antonovsky, Aaron. (Ben Gurion U of the Negev, Regional Ctr for Health Sciences, Beer-Sheva, Israel) **Conceptual and methodological problems in the study of resistance resources and stressful life events.** In B. S. Dohrenwend & B. P. Dohrenwend (Eds), *Stressful life events: Their nature and effects*. New York, NY: John Wiley & Sons, 1974. xi, 340 p.

5301. Apfeldorf, Max et al. (VA Ctr, Martinsburg, WV) **A method for the evaluation of affective associations to figure drawings.** *Journal of Personality Assessment*

ment, 1974(Oct), Vol 38(5), 441-449.—Usual scoring systems for figure drawing techniques are based on structural and content aspects of the drawing and ignore the affectively toned associations that occur when an O first sees a drawing. A system for measuring 2 components of judgment—emission of affective associations and evaluation of affective associations—was developed and tested with 19 female undergraduates who had represented in their drawings an image that corresponded to their actual physical appearance. Results suggest that the evaluation component of judgment may contribute more to discrimination than the emission component.—*Journal abstract.*

5302. Battista, John & Almond, Richard. (Langley Porter Neuropsychiatric Inst, San Francisco, CA) **The development of meaning in life.** *Psychiatry*, 1973(Nov), Vol 36(4), 409-427.—Presents an operational definition of the term "meaningful life." 2 previous tests for meaningfulness in life—the Personal Orientation Inventory and the Purpose in Life Test—are evaluated, a 3rd—the Life Regard Index (LRI)—is described. Validation of the LRI is presented. 5 theoretical approaches to the development of positive life regard are discussed: philosophical, relativistic, psychological, transactional, and phenomenological. The LRI appears to be a useful preliminary measure and the phenomenological model most descriptive. The LRI is presented in an appendix. (44 ref)—*E. M. Uprichard.*

5303. Boor, Myron. (Ft Hays Kansas State Coll) **Dimensions of internal-external control and marital status, sex, age, and college class.** *Journal of Social Psychology*, 1974(Oct), Vol 94(1), 145-146.—Data obtained from 366 Ss indicate that unmarried Ss scored significantly higher on items on Rotter's Internal-External Control Scale (I-E) that pertain to relatively immediate, personally relevant environmental events and on the total I-E scale.

5304. Braun, John R. & Calandro, Patricia A. (U Bridgeport) **Effects of different instructions on consistency of personality inventory responses.** *Journal of Personality Assessment*, 1974(Oct), Vol 38(5), 459-461.—A novel feature of the Edwards Personality Inventory (EPI) is that the S responds to the items as he believes those who know him best would answer if asked to describe him. The present study tested the EPI hypothesis that reliability would be higher for these instructions vs the more conventional ones to "describe yourself directly as you see yourself." 60 undergraduates were tested in each of 3 conditions: Booklet IA (test-retest), Booklet IB (test-retest), and Booklets IA and IB (alternate forms reliability). Within each condition, approximately half responded under EPI novel instructions and half responded under conventional instructions. Directly contrary to the prediction, the proportion of conventional instruction correlations which were higher than the corresponding novel instruction correlations was significantly greater than chance ( $p < .01$ ).—*Journal abstract.*

5305. Brown, Marilyn; Jennings, Jim & Vanik, Vickie. (California State U, Humboldt) **The motive to avoid success: A further examination.** *Journal of Research in Personality*, 1974(Aug), Vol 8(2), 172-176.—Replicated and extended M. S. Horner's 1968 "fear of success"

study. 177 high school and college students wrote stories in response to the following cues: "After first-term finals, John (Anne) finds himself (herself) at the top of his (her) medical-school class." Results indicate similarity of response of high school men and women and college men, all of whom expressed more fear of success imagery in response to the Anne cue than to the John cue. College women did not conform to this pattern.—*Journal abstract.*

5306. Bruch, Hilde. (Baylor U) **Interpersonal theory: Harry Stack Sullivan.** In A. Burton (Ed), *Operational theories of personality*. New York, NY: Brunner/Mazel, 1974. x, 421 p. \$15.—Outlines the influence of Sullivan's principles and practices on modern psychiatry. The psychotherapeutic implications are discussed.

5307. Burton, Arthur (Ed.). (Private practice, Sacramento, CA) **Operational theories of personality.** New York, NY: Brunner/Mazel, 1974. x, 421 p. \$15.

5308. Burton, Arthur. (Private practice, Sacramento, CA) **Existential and humanistic theories: I. Ludwig Binswanger.** In A. Burton (Ed), *Operational theories of personality*. New York, NY: Brunner/Mazel, 1974. x, 421 p. \$15.—Discusses Binswanger's role in the influence of phenomenology and existentialism on classical psychoanalysis. It is noted that the existential analyst is more of a process model than the Freudian analyst. (23 ref)

5309. Burton, Arthur. (Private practice, Sacramento, CA) **The nature of personality theory.** In A. Burton (Ed), *Operational theories of personality*. New York, NY: Brunner/Mazel, 1974. x, 421 p. \$15.—Examines the various elements involved in personality theory and notes their relationship to the healing of anxious or non-normative personalities. The elements include growth and deficit, symbolism, the unconscious, change, and morality. The nature of a personality theory is outlined.

5310. Burton, Arthur. (Private practice, Sacramento, CA) **Existential and humanistic theories: II. Ronald D. Laing.** In A. Burton (Ed), *Operational theories of personality*. New York, NY: Brunner/Mazel, 1974. x, 421 p. \$15.—Describes Laing's approach to psychiatry as existential phenomenology. The concepts of phenomenology are defined and discussed.

5311. Crawford, Charles B. (Simon Fraser U, Burnaby, British Columbia, Canada) **A canonical correlation analysis of cortical evoked response and intelligence test data.** *Canadian Journal of Psychology*, 1974(Sep), Vol 28(3), 319-332.—Notes that there has recently been considerable interest in the use of averaged cortical evoked responses for the measurement of intelligence. To the clinical or educational psychologist they may provide a more objective assessment of intelligence. To the researcher interested in the nature and development of intelligence they may provide a means of investigating the biological substrate of intelligence. The present canonical correlation analysis of evoked response and intelligence test data from a previous study seems to indicate that, while evoked response data may have some value for research, it may not be so useful for individual prediction. (French summary) (25 ref)—*Journal abstract.*

5312. de Bonis, Monique. (Clinique des Maladies Mentales et de l'Encéphale, Lab de Psychologie Médicale, Paris, France) **Content analysis of 27 anxiety**

inventories and rating scales. In P. Pichot, R. Olivier-Martin (Eds), *Psychological measurements in psychopharmacology*. Basel, Switzerland: S. Karger, 1974. 267 p. \$35.75.

5313. **de Grâce, Gaston-René** (U Laval, Quebec, Canada) **The compatibility of anxiety and actualization.** *Journal of Clinical Psychology*, 1974(Oct), Vol 30(4), 566-568.—While traditional personality theories view anxiety and actualization as mutually exclusive, some more recent ones consider the possible positive role of anxiety in actualization. The present study hypothesized that there would be no significant difference in terms of level of anxiety between a group of actualized (EG) and another group of nonactualized (CG) Ss. The Ss, 18 for the EG and 12 for the CG, were selected among male forestry majors in a junior college by means of the Personal Orientation Inventory. Ss were administered the Institute for Personality and Ability Testing Anxiety Scale (French version). Results, which confirm the hypothesis, are discussed in relation to existing theories and experimental data.—*Journal summary*.

5314. **Diamond, Michael J. & Bond, Michael H.** (U Hawaii) **The acceptance of "Barnum" personality interpretations by Japanese, Japanese-American, and Caucasian American college students.** *Journal of Cross-Cultural Psychology*, 1974(Jun), Vol 5(2), 228-235.—A total of 34 native Japanese, 32 Japanese-American, and 24 Caucasian American students at universities in Japan and Hawaii were compared on their acceptance of "Barnum" personality statements (i.e., personality descriptions worded in very general and ambiguous terms). The Barnum descriptions were presented to the Ss as having been interpreted by "several clinical psychologists" from the Ss' Rorschach protocols. Results indicate that all 3 groups were equally and highly likely to endorse these descriptions as being true of themselves even when attempts were made to control for compliance effects. Findings are discussed with reference to similar acculturation influences in terms of mass media and course content self-concept learning experiences among university students. The utility of intra- and intercultural personality assessment is considered in terms of the high base-rate Barnum statement acceptance. (15 ref) —*Journal abstract*.

5315. **Dohrenwend, Bruce P.** (Columbia U, Coll of Physicians & Surgeons) **Problems in defining and sampling the relevant population of stressful life events.** In B. S. Dohrenwend & B. P. Dohrenwend (Eds), *Stressful life events: Their nature and effects*. New York, NY: John Wiley & Sons, 1974. xi, 340 p.

5316. **Durand, Douglas & Shea, Dennis.** (U Missouri, School of Business Administration, St Louis) **Entrepreneurial activity as a function of achievement motivation and reinforcement control.** *Journal of Psychology*, 1974(Sep), Vol 88(1), 57-63.—Gave reinforcement control and achievement motivation measures (Rotter's Internal-External Control Scale and the Thematic Apperception Test, respectively) to 22 male and 7 female black adults engaged in operating small businesses. Level of business activity was assessed 18 mo later. Ss with a high need to achieve were found to be significantly more active than those whose achievement motivation was low. Activity scores of internal locus of control Ss were

significantly higher than those of externals. Internals with a high need to achieve were significantly more active than all others. Data suggest that thoughts are most successfully translated into action when the individual feels in control of his fate and recognizes the steps that are instrumental in reaching goals.—*Journal abstract*.

5317. **Eggert, Dietrich.** [**Eysenck-Persönlichkeits-Inventar: E-P-I: Handanweisung für die Durchführung und Auswertung.** (Eysenck Personality Inventory (EPI): Directions for its implementation and evaluation.)] (Germ) Göttingen, W Germany: Verlag für Psychologie, Dr C. J. Hogrefe, 1974. 32 p.

5318. **Eiduson, Bernice T.** (U California, Medical School, Los Angeles) **10-year longitudinal Rorschachs on research scientists.** *Journal of Personality Assessment*, 1974(Oct), Vol 38(5), 405-410.—Administered the Rorschach test to 40 male Caucasian research scientists in 1959 and in 1969, as part of a battery of projective and objective measures and depth interviews in a 10-yr study of changes in and factors influencing Ss' career development. Results show (a) Ss' personalities were remarkably stable over time; (b) pre- and posttest changes were evident only in the area of content; (c) Ss showed a lessened interest in sexuality and less originality in thinking at the 2nd session; (d) work remained a basically strong motivating factor, although there was less involvement in work from the point of view of satisfaction; and (e) none of the changes measured were related to changes in career lines.—*B. McLean*.

5319. **Ekstein, Rudolf.** (Reiss-Davis Clinic, Childhood Psychosis Project, Los Angeles, CA) **Psychoanalytic theory: Sigmund Freud.** In A. Burton (Ed), *Operational theories of personality*. New York, NY: Brunner/Mazel, 1974. x, 421 p. \$15.—Examines the assumptions and structure of psychoanalytic theory. Various models of the analytic process are analyzed. A case illustration is presented in detail. Speculations on the future of psychoanalysis are included.

5320. **Exner, John E.** (Long Island U) **The Rorschach: A comprehensive system.** New York, NY: John Wiley & Sons, 1974. xx, 488 p. \$27.50.—Based on several approaches to the Rorschach test developed between 1935 and 1957, an integrated system is presented which includes methods of administration and scoring, the working tables necessary for scoring and interpretation, and principles of interpretation. 12 sample protocols are presented to show how the test may be used.

5321. **Felj, J. A. & Orlebeke, J. F.** (Vrije U, Amsterdam, Netherlands) **Spiral aftereffect duration as a correlate of impulsiveness.** *Journal of Research in Personality*, 1974(Aug), Vol 8(2), 189-197.—Data from a correlational analysis show that impulsiveness, assessed in 40 male undergraduates using a questionnaire concerned with speed of judgment and decision making, was negatively correlated with spiral aftereffect (SAE) duration. However, this relationship was present only in Ss with high neuroticism scores (assessed with a Dutch modification of the Maudsley Personality Inventory). In Ss with high neuroticism scores, SAE was also positively related to debilitating anxiety. A parallel was suggested between impulsiveness and G. Heyman's concept of "secondary function," a personality dimension which

was similarly operationalized in a visual aftereffect experiment. Some other SAE correlates are discussed, including heart rate and galvanic skin response amplitude. (23 ref)—*Journal abstract*.

5322. Fisher, Harwood. (City Coll, City U New York) **Logic and language in defences.** *Journal for the Theory of Social Behaviour*, 1973(Oct), Vol 3(2), 157-214.—Explores the concept of defense mechanisms with particular respect to the logic of defensive beliefs, the syntax of defensive language, and the semantic issues affected. A descriptive model is presented that attempts to clarify issues such as personality development and functioning (especially distortions of personal and social reality), ways of knowing facts, and accessibility to dialog about beliefs. It is concluded that (a) defenses can be studied carefully in terms of verbal language; (b) linguistic analyses of dialogs in therapy, education, and law may be made; and (c) these analyses may be helpful in discovering syntactic dimensions of superficial as well as "deeper" structures to the things people say. (16 ref)—*R. S. Albin*.

5323. Frodi, Ann. **On the elicitation and control of aggressive behavior.** *Göteborg Psychological Reports*, 1974, Vol 4(8), 16 p.—Summarizes the main contents of 4 articles, including (a) a review of recent theoretical and empirical work in the field of aggression, (b) the effects of exposure to aggression-eliciting and aggression-inhibiting stimuli on subsequent aggression, (c) hostility catharsis revisited, and (d) alternatives to aggressive behavior for the reduction of hostility. Several theories of aggression are examined. The importance of stimuli in the environment for the elicitation of aggressive behavior is discussed as well as cognitive restructuring as a means for reducing hostility. The notion of demand characteristics is discussed, as well as the ecological validity of laboratory research. (61 ref)—*Journal abstract*.

5324. Garfield, Charles A. (U California, Berkeley) **A psychometric and clinical investigation of Frankl's concept of existential vacuum and of anomia.** *Psychiatry*, 1973(Nov), Vol 36(4), 396-408.—Differentiates between the concepts of existential vacuum and anomia. The former refers to the failure to experience a sense of meaning which provides a self-identity. Anomia is a personal state in which social cohesion is minimal or nonexistent. To study the differences 222 Ss from 5 groups given the Purpose-In-Life Test (PIL), 2 anomia scales, and the California Psychological Inventory (CPI). Ss were ghetto residents, engineers, graduate psychology students, inhabitants of a rural commune, and graduate students in religion. The PIL did not correlate with either the anomia scales or the CPI, but the 2 anomia scales did correlate with each other. A further interview was conducted with high and low anomic Ss from each group. The different groups were found to have different interpretations of the phenomenon of existential vacuum.—*E. M. Uprichard*.

5325. Gjesme, Torgrim. (U Oslo, Norway) **Goal distance in time and its effects on the relations between achievement motives and performance.** *Journal of Research in Personality*, 1974(Aug), Vol 8(2), 161-174.—Based on N. E. Miller's theoretical model, it was predicted that (a) pupils high in motive to approach success and low in motive to avoid failure (approach-

oriented) would increase and (b) those with the opposite motive constellation (avoidance-oriented) would decrease their level of performance as a distant future goal approaches in time. Ss were 411 Norwegian 6th graders who completed the Achievement Motives Scale. These hypotheses were supported when number of problems solved correctly was used as measure of level of performance, while only the first hypothesis received support when number of problems attempted was employed. The hypothesis that avoidance-oriented pupils would have a steeper slope of goal gradient for performance than the approach-oriented pupils received no support. (24 ref)—*Journal abstract*.

5326. Gonzalez-Tamayo, Eulogy. **Dogmatism, self-acceptance, and acceptance of others among Spanish and American students.** *Journal of Social Psychology*, 1974(Oct), Vol 94(1), 15-25.—Assessed the extent to which open societies produce open-minded persons and closed societies close-minded persons. Male and female Catholic high school students, from Spain and from the US, were compared on dogmatism scores (DS), acceptance of self (SA), and of others (AO). Results indicate that the 3 variables were significantly related in both countries and for both sexes. Spanish Ss scored significantly higher in DS and lower in AO than American Ss. Girls scored significantly higher than boys in AO in both countries; boys scored significantly lower in DS and higher in SA than girls in Spain, but the opposite was the case in the US. Ss from higher socioeconomic class scored lower in DS (in both countries) and higher in SA and AO (only in Spain) than Ss from lower classes. The more yrs the father had gone to school, the lower the children scored on DS in the US and the higher they scored on SA in Spain. Results suggest that society is a source of differences in attitudes and the relationship between beliefs organization and attitudes toward self and others.—*Journal abstract*.

5327. Haan, Norma & Day, David. (U California, Inst of Human Development, Berkeley) **A longitudinal study of change and sameness in personality development: Adolescence to later adulthood.** *International Journal of Aging & Human Development*, 1974(Win), Vol 5(1), 11-39.—The life span from early adolescence to later adulthood, with assessments at 4 time periods, was described by means of Q-sort items and analyzed according to processes of personality change and maintenance of sameness. Change was determined by analysis of variance with repeated measures, and sameness was indexed by intraclass product movement correlation coefficients. A replicative design was used with a total of 136 longitudinally studied participants in 4 different samples: male and female participants in the Oakland Growth Study and the Guidance Study. The preservation of sameness was the most frequently observed phenomenon, but 2 different kinds of systematic change were identified: transpositions within the participants' maintenance of internal consistency across time, and emergent changes for samples with marked discontinuities among individuals. The pattern of results is consistent with the view that development during adulthood involves reorganization, and the content of the findings is compatible with E. Erikson's description

of the stages of identity formation, intimacy, generativity, and integrity. (16 ref)—*Journal abstract.*

5328. Harshbarger, Thad R. (City Coll, City U New York) **Differential desirability.** *Journal of Clinical Psychology*, 1974(Oct), Vol 30(4), 535-540.—18 items from the Edwards Personal Preference Schedule were administered to 42 male and 69 female undergraduates for self-report and for judgments of desirability "in others," "in men," and "in women." Male and female Ss had similar masculine and similar feminine desirability stereotypes; but both groups used a different set of standards for men and women. Self-reports of the males tended to conform to the masculine desirability stereotype, and self-reports of the females tended to conform to the feminine desirability stereotype. It is concluded that desirability "in others," used by Edwards, is inadequate to match statements in the items examined, and probably is inadequate to match many other statements in items throughout the test. The results suggest that, if the concept of social desirability is to describe adequately Ss' judgments of other people, it must be articulated more finely than it has been in the past.—*Journal summary.*

5329. Hay, Nancy M. & Stewart, Norman R. (U Missouri, Counseling Service, St Louis) **Reliability coefficients from two administrations of the Willoughby Personality Schedule.** *Journal of Counseling Psychology*, 1974(Nov), Vol 21(6), 581-582.—Determined internal consistency and test-retest reliability coefficients for the Willoughby Personality Schedule (WPS), currently used as an outcome measure in research and in clinical practice. The WPS was administered twice to 285 undergraduates from 2 universities with a 3-wk interval between testings. The Hoyt analysis of variance procedure yielded an internal consistency reliability coefficient of .90 on the 1st testing. The test-retest reliability coefficient was .89.—*Journal abstract.*

5330. Hayashi, Tamotsu & Yamauchi, Hirotsugu. (Kyoto U of Education, Japan) **Causal attributional judgments for achievement-related events.** *Japanese Psychological Research*, 1974(May), Vol 16(1), 40-49.—Classified 18 male undergraduates in high- and low-need-achievement groups and asked them to rate the degree to which a task outcome of a to-be-judged person was attributable to each of 4 causal elements. Some information about the task outcome and the expectation of success or failure at a task were given to Ss prior to their causal attributional judgments. Attribution scores on each of the causal elements for each condition of outcome were analyzed separately. Analyses of the data yielded 2 interesting findings—attributional cognitive patterns were a function of the level of achievement motivation and were also a function of the degree of discrepancy between expectation and outcome.—*Journal abstract.*

5331. Hekmat, Hamid; Khajavi, Farrokh & Mehryar, Amir. (U Wisconsin, Stevens Point) **Psychoticism, neuroticism, and extraversion: The personality determinants of empathy.** *Journal of Clinical Psychology*, 1974(Oct), Vol 30(4), 559-561.—R. Hogan's empathy scale together with Eysenck's Psychoticism-Extraversion-Neuroticism Inventory were given to 475 undergraduates. Results indicate that empathy correlated negatively with psychoticism and neuroticism. There was a significant

positive correlation between empathy and extraversion. Results support the conclusion that propensity toward psychological disturbances lowers empathy significantly for both sexes.

5332. Hillman, James. (C. G. Jung Inst, Zurich, Switzerland) **Archetypal theory: C. G. Jung.** In A. Burton (Ed), *Operational theories of personality*. New York, NY: Brunner/Mazel, 1974. x, 421 p. \$15.—Examines the therapeutic implications of the theories of archetypal psychology. Jung's terminology and definitions are discussed. A case history is presented to illustrate application of the theories in analysis. (29 ref)

5333. Hüneke, Henrich & Hoeth, Friedrich. (U Heidelberg, Social Psychiatric Clinic, W Germany) **[Set and dimensions in the evaluation of personality characteristics.]** (Germ) *Zeitschrift für Experimentelle und Angewandte Psychologie*, 1974, Vol 21(1), 80-102.—Gave a personality questionnaire to 2 groups of education students. Group 1 ( $n = 87$ ) was instructed to answer truthfully; Group 2 ( $n = 107$ ) was urged to make a good impression. Neuroticism scores were significantly lower for Group 2; all other scores were higher. Factor analysis yielded 5 factors for Group 1 and only 3 for Group 2. The 1st 4 factors for Group 1 were similar to Neuroticism, Rigidity, Extraversion, and a Lie factor. The 5th factor was interpreted as Social Desirability dimension. (English & French summaries)—*W. J. Koppitz.*

5334. Iacino, Linda W. & Cook, Patrick E. (Florida State U) **Threat of shock, state anxiety, and the Holtzman Inkblot Technique.** *Journal of Personality Assessment*, 1974(Oct), Vol 38(5), 450-458.—To study the relationship of selected Holtzman Inkblot Technique (HIT) scores and anxiety, 38 experimental and 38 control undergraduates were matched on the basis of Anxiety-Trait (A-Trait) scores on the State-Trait Anxiety Inventory (STAI). The HIT was administered under neutral and threat-of-shock conditions. State anxiety was monitored by means of the A-State scale of the STAI. None of the HIT variables reflected changes in A-State due to the experimental conditions. HIT anxiety correlated significantly with STAI A-Trait. Results are discussed in terms of Trait-State Anxiety theory and previous research. (32 ref)—*Journal abstract.*

5335. Jacobson, Jacob G. **Reliving the past, perceptual experience and the reality-testing functions of the ego.** *International Journal of Psycho-Analysis*, 1973, Vol 54(4), 399-413.—Presents a case history to illustrate 4 component functions of the ego which participate in reality testing: (a) perception of the differentiation of self from object and the broader distinction of internal from external, (b) perception of differentiated objects, (c) perception of differentiated states of the self, and (d) perception of affective experiences in the inner world. When any one of these fails, the past intrudes into the present; but when these functions can be exercised, a fifth rises from their synthesis, i.e., the ability to differentiate the present from the past. The conceptual and developmental issues involved in the 4 functions are discussed, including the historical development of concepts of reality testing. (44 ref)—*C. T. Sullivan.*

5336. Jardim, Anne. **The first Henry Ford: A study in personality and business leadership.** Cambridge, MA: MIT Press, 1970. ix, 278 p. \$3.95.

5337. Joe, Victor C. (Idaho State U) **Personality correlations of conservatism.** *Journal of Social Psychology*, 1974(Aug), Vol 93(2), 309-310.—Attempted to provide additional construct validation for the Conservatism Scale developed by G. D. Wilson and J. R. Patterson by administering it and other tests (e.g., the California F Scale—Fascism) to American college students. Conservatism was significantly related to 20 of the 25 variables studied, supporting Wilson and Patterson's (1968) description of a conservative.

5338. Kakar, Sudhir. **Frederick Taylor: A study in personality and innovation.** Cambridge, MA: MIT Press, 1970. xi, 221 p. \$3.45.

5339. Kline, Paul & Mohan, Jitendra. (U Exeter, England) **Cultural differences in item endorsements in a personality test—Ai3Q—in India, Ghana, and Great Britain.** *Journal of Social Psychology*, 1974(Oct), Vol 94(1), 137-138.—Administered a 30-item personality questionnaire, measuring the anal character or obsessional personality, to 181 female Indian students. A comparison with similar tests conducted in Ghana and Britain indicates that there were large differences in the endorsement of items in each culture, it was possible to discern how differing cultural factors produce these differences; certain items were not affected as was expected, while others changed for no obvious reason.

5340. Klopfer, Walter G. (Portland State U) **The Rorschach and old age.** *Journal of Personality Assessment*, 1974(Oct), Vol 38(5), 420-422.—Discusses studies which used the Rorschach technique with aged individuals, focusing on administration and evaluation problems encountered in early studies and on interpretation of Rorschach responses of the elderly. These responses show that older persons (a) tend to be intellectually slower and more unproductive than younger persons, (b) are emotionally unstable and have restricted thought contact, (c) are more efficient in dealing with practical than with theoretical problems, and (d) tend to feel inferior and react well to support. It is suggested that the future of the use of the Rorschach with the elderly depends on the degree to which clinicians can refrain from stereotyping the aged as they have stereotyped other heterogeneous groups (e.g., alcoholics, homosexuals, and schizophrenics).—B. McLean.

5341. Kroy, M. (Tel Aviv U, Israel) **The conscience: A structural theory.** New York, NY: John Wiley & Sons, 1974. xv, 228 p.—Presents an analysis and discussion of the structural aspects of moral judgment and their relations to other mental phenomena. Programs for representational systems of conscience, structural theories of the imagination, and empirical applications of the theories to moral arguments and emotions, moral development and pathology, and optimal value systems are examined. (180 ref)

5342. Lee, Robert & Piercy, Fred P. (U Florida) **Church attendance and self-actualization.** *Journal of College Student Personnel*, 1974(Sep), Vol 15(5), 400-403.—Administered the Personal Orientation Inventory and a questionnaire on the frequency of church attendance to 61 undergraduates at a large nondenominational state

university and 40 undergraduates at a Baptist-related university. Twice as many Ss at the church-related university attended services on a regular basis than Ss at the state college (60 vs 30%). Significant differences were found on the Inner-Directed scale, and the Existentiality, Feeling Reactivity, and Capacity for Intimate Contact subscales between regular and infrequent attenders, with infrequent attenders scoring higher. There was also a significant Sex  $\times$  Attendance interaction, with female attenders and male and female infrequent attenders scoring significantly higher than male attenders.—L. Gorsey.

5343. Mack, John E. (Harvard U, Medical School, Boston) **Nightmares & human conflict.** Boston, MA: Houghton Mifflin, 1974. xxiii, 258 p. \$3.45.—Presents a general survey of theory and research on nightmares, emphasizing why they occur and the various determinants of the anxiety experienced during nightmares. Topics include characteristics of nightmares, the clinical occurrence of nightmares in children and adults, and the relationship of nightmares to creativity, aggression, and psychoses.

5344. Mahoney, E. R. (Western Washington State Coll) **Body-cathexis and self-esteem: The importance of subjective importance.** *Journal of Psychology*, 1974(Sep), Vol 88(1), 27-30.—Research investigating the relationship between body cathexis and self-esteem has frequently dealt with the problem of the use of body-cathexis scores weighted by the S's rating of the personal importance of body aspects. Since the original research in this area, 2 studies have presented contradictory data when testing the hypothesis that the greater the importance of body aspects to the individual, the greater the correlation between self-esteem and body cathexis. This hypothesis was tested in the present study with 227 undergraduates, using several approaches to the question. Data clearly indicate that there was no relationship between Ss' subjectively stated importance of body aspects and statistical importance in the form of correlations between body cathexis and self-esteem.—*Journal abstract.*

5345. McGilligan, Robert P. & Barclay, Allan G. (U Missouri, St Louis) **Sex differences and spatial ability factors in Witkin's "differentiation" construct.** *Journal of Clinical Psychology*, 1974(Oct), Vol 30(4), 528-532.—Compared the scores of 20 male and 20 female 9th graders on H. Witkin's rod-and-frame test (RFT), the California Psychological Inventory (CPI), and the Primary Mental Abilities Test Spatial Relations subtest. No sex difference on Spatial Relations was obtained, nor was there a significant difference in RFT scores found which could be attributed to Spatial Relations. Contrary to the expectations derived from one of the criticisms of Witkin's construct, however, a sex difference in favor of males was found on RFT. Analyses of CPI scores yielded a significant main effect for RFT on 13 of the 18 CPI scales, but on only 4 scales when Spatial Relations was controlled as well as IQ. There was a significant correlation between RFT and Spatial Relations, suggesting that Spatial Relations does interact in some manner with both differentiation and personality. (15 ref) —*Journal summary.*

5346. Meyer, Mortimer M. (Reiss-Davis Child Study Ctr, Los Angeles, CA) **Rorschach symposium in memory of Bruno Klopfer: Introduction.** *Journal of Personality Assessment*, 1974(Oct), Vol 38(5), 403-404.—Briefly reviews the 3 topics included in the Rorschach symposium. Each deals with research findings related to the understanding of personality as it reflects specific aspects of the coping process: progressing in professional life, the normal process of aging, and the abnormality seen in a breakdown of the coping process.

5347. Miller, F. T.; Bentz, W. K.; Aponte, J. F. & Brogan, D. R. (U North Carolina, Chapel Hill) **Perception of life crisis events: A comparative study of rural and urban samples.** In B. S. Dohrenwend & B. P. Dohrenwend (Eds), *Stressful life events: Their nature and effects*. New York, NY: John Wiley & Sons, 1974. xi, 340 p.

5348. Mohan, Jitendra & Rajinder, Miss. (Punjab U, Chandigarh, India) **A study of personality correlates of psychomotor performance.** *Indian Journal of Psychometry & Education*, 1973(Dec), Vol 4(2), 54-58.—Assessed relationships between the extroversion-introversion and neuroticism-emotionality dimensions of the Eysenck Personality Inventory (EPI) and psychomotor tasks of word substitution and inverted alphabets. 40 female Ss out of 55 (average age 18 yrs) were selected on the basis of EPI scores. Ss scoring high on the Lie scale were excluded. Ss were then given the tasks. Results indicate significant positive relationships between the tasks themselves and between neuroticism and inverted alphabet writing. It is concluded that Eysenck's personality theory does not explain simple psychomotor performance well.—J. B. Francis.

5349. Neman, Ronald S.; Brown, Thomas S. & Sells, S. B. (Texas Christian U, Inst of Behavioral Research) **Language and adjustment scales for the Thematic Apperception Test for children 6-11 years old.** *Vital & Health Statistics, Series 2*, 1973(Dec), No 58, 70 p.—Summarizes results of 2 studies on the development of objectively scored language and emotionality scales for a 5-card, orally administered and tape-recorded version of the Thematic Apperception Test (TAT) used in the Health Examination Survey (HES) of 6-11 yr old children conducted in 1963-1965. Study 1 involved the development of scoring manuals, criterion measures, and TAT scales, in addition to validation studies in which TAT scales were used as independent variables and the criteria as dependent variables. Study 2 involved cross-validation and refinement of Study 1 and the development of national norms. The development of 5 criterion scales (school adjustment, poor health, intellectual development, social adjustment, and emotional disturbance), their relationship to age, sex, and race, and the development of the 6 TAT scales (Verbal Productivity, Dysphoric Mood, Conceptual Maturity, Narrative Fluency, Emotionality, and Verbal Fluency) are discussed in detail. The structural and thematic scoring manuals are included.—L. Gorsey.

5350. O'Gorman, J. G. (U New England, Armidale, NSW, Australia) **A comment on Koriati, Averill and Malmstrom's "Individual differences in habituation."** *Journal of Research in Personality*, 1974(Aug), Vol 8(2), 198-202.—Discusses some theoretical and methodologi-

cal issues raised by the article by A. Koriati et al (see PA, Vol 51:5214) concerning the consistency and reliability of measures of habituation currently used in personality research. It is argued that the problem of reliability is not as serious as Koriati et al proposed and that specificity of measures of habituation is a theoretical rather than a methodological problem. It is proposed that ambiguity in the literature on the personality correlates of habituation is more likely to be due to the failure to consider the effects of stimulus conditions on habituation than to the problems of reliability and specificity. (17 ref)—*Journal abstract*.

5351. Orpen, Christopher & Lisus, Glyn. (U Cape Town, South Africa) **Self-esteem and the relationship between need-fulfilment and job satisfaction.** *Journal of Social Psychology*, 1974(Aug), Vol 93(2), 307-308.—Contrary to expectations, a lower correlation between self-rated need-fulfilment and job satisfaction was obtained for high self-esteem than low self-esteem South African white professionals. Results do not support A. Korman's (1970) hypothesis of the importance of self-esteem in work behavior.

5352. Ramos, Edith. (U Federal de Rio de Janeiro, Brazil) **[Personal image of the Nisei adolescent.]** (Port) *Revista Latinoamericana de Psicologia*, 1974, Vol 6(2), 229-234.—Administered the Adjective Check List to 100 adolescent Nisei (Brazilians of Japanese origin). Results were analyzed in terms of the self-image of this group, who represent a "bridge between 2 cultures." The main variable was self-esteem, and high scores were obtained by both males and females.

5353. Rand, Per. (U Oslo, Norway) **Curvilinear relationship between motive strength and performance: A possible explanation based on J. W. Atkinson's model.** *Scandinavian Journal of Educational Research*, 1973, Vol 17(3), 83-94.—Predicted an S-shaped relationship between motive strength and performance based on (a) J. W. Atkinson's 1957 model; and (b) the assumption that, given motive to seek success ( $M_s$ ) and motive to avoid failure ( $M_f$ ) of unequal strength, there is a correspondence between magnitude and direction of motive dominance ( $M_s-M_f$ ) and amount and direction of distortion of subjective probability of success relative to objective probability of success. An empirical check involving 595 6th-grade Ss supported the predicted relationship in the results from 3 out of 6 tasks employed (anagrams, synonyms, and antonyms given in easy and hard forms).—*Journal abstract*.

5354. Rim, Y. (Technion-Israel Inst of Technology, Israel) **The validation of a new disturbance test.** *Psychologia: An International Journal of Psychology in the Orient*, 1974(Jun), Vol 17(2), 91-93.—Describes a validation of the McQuitty Disturbance Test (MDT). Ss were 124 job applicants 18-30 yrs old (mean age 25 yrs) at 2 banks in Israel. About 30% were males. It was hypothesized that highly disturbed Ss on the MDT would have high scores on other tests of disturbance and on certain correlates. Results confirm the hypotheses and are viewed as a validation of the MDT.—R. D. Nance.

5355. Rodstein, Manuel. (Jewish Home & Hosp for Aged, New York, NY) **Accident proneness.** *JAMA: Journal of the American Medical Association*, 1974(Sep), Vol 229(11), 1495.—Discusses indicators of accident-

prone individuals, factors affecting vulnerability, and possible psychiatric mechanisms underlying the occurrence of accidents in these persons. Several characteristics have been described as high in incidence among accident-prone persons, including youth, early exposure to injury, violence, authoritarian parents, childless marriages, and sexual conflicts. Boredom, loneliness, anxiety, and frustration are also among factors which make these people more vulnerable to accidents, particularly in cases of increased physical strain. It is emphasized, however, that the personality type found in accident-prone persons often occurs in those without a history of frequent accidents, although they may exhibit other diseases with strong psychosomatic components.—*L. Gorsey.*

5356. Rogers, T. B. (U Calgary, Alberta, Canada) **An analysis of two central stages underlying responding to personality items: The self-referent decision and response selection.** *Journal of Research in Personality*, 1974(Aug), Vol 8(2), 128-138.—Used S. Sternberg's 1969 technique for isolating substages in a processing sequence to examine 2 central stages in a postulated model of responding to personality items. The Self-Referent Decision (SRD) stage, where item content is compared to stored memory elements, and the Response Selection Stage, where the output of the SRD is mapped into available response alternatives, were analyzed to determine if they could be seen as separate stages. Data from 24 undergraduates who responded to 56 controversial or noncontroversial items in Likert-type or true-false formats indicate that a modular model that viewed these 2 stages as separate is valid. Results are also discussed in relation to existing models of item responding processes and the dichotomous/Likert response format issue. (22 ref)—*Journal abstract.*

5357. Sachs, Lisbeth J. (New York U, Medical Ctr) **On crying, weeping and laughing as defenses against sexual drives, with special consideration of adolescent giggling.** *International Journal of Psycho-Analysis*, 1973, Vol 54(4), 477-484.—Suggests that crying, weeping, and laughing can be employed as defenses against sexual drives, especially in females, with illustrative material from 4 case histories of adolescents and young adults. The concomitant discharge of body fluid is considered as a possible "break" in such defenses. (22 ref)

5358. Saunders, Thomas R. & Gravitz, Melvin A. (Walter Reed Army Medical Ctr, Washington, DC) **Sex differences in the endorsement of MMPI critical items.** *Journal of Clinical Psychology*, 1974(Oct), Vol 30(4), 557-558.—Based upon the MMPI critical items, data from 6,686 male and 4,717 female job applicants reveal little support for a "repression" interpretation of personality inventory test-taking style among females. Females were more likely than males to endorse critical items, especially those that deal with such internal psychological discomforts as generalized anxiety and sex-role acceptance.

5359. Schlesheim, Chester & Kerr, Steven. (Ohio State U, Coll of Administrative Science) **Psychometric properties of the Ohio State leadership scales.** *Psychological Bulletin*, 1974(Nov), Vol 81(11), 756-765.—Reviews evidence concerning the validity, reliability, and scaling adequacy of 4 versions of the Ohio State

leadership scales. A number of shortcomings are noted, due either to the lack of relevant data (e.g., with respect to construct validity) or actual inadequacies of the scales (e.g., item response skewedness). The 4 versions are shown to be substantially different psychometrically; although suffering from some deficiencies and requiring further refinement, one version of the scales appears sounder than the others. (48 ref)—*Journal abstract.*

5360. Schwartz, Marilyn M. & Gaines, Lawrence S. (U Maryland) **Self-actualization and the human tendency for varied experience.** *Journal of Personality Assessment*, 1974(Oct), Vol 38(5), 423-427.—Investigated whether self-actualization may be conceptualized as an expression of the human need for varied stimulation. Self-report assessment was made of 120 undergraduates' level of self-actualization (as measured by the Personal Orientation Inventory) and preferences for kinds (cognitions and sensations) and sources (interoceptive and exteroceptive) of varied stimulation (Novelty Experiencing Scale). Self-actualizing Ss differed from non-self-actualizing Ss in the amount of total stimulus-seeking behavior but not in their preference for source or kind of stimulation. Discussion of results focuses upon an active-passive aspect of the need for varied experience. (29 ref)—*Journal abstract.*

5361. Seaman, Jerrol M. & Koenig, Frederick. (Loyola U, New Orleans) **A comparison of measures of cognitive complexity.** *Sociometry*, 1974(Sep), Vol 37(3), 375-390.—To allow investigation of the effects and/or sources of different forms of cognitive complexity in the same research design, the Grid Form of the Role Construct Repertory Test (RCRT) is proposed as a format from which to obtain different measures of complexity at the same time using the same response data. Using positive and negative person objects as stimuli, 3 types of complexity measures are derived from the Grid Form of the RCRT: 3 measures based on tied ratings, the Fiedler most preferred coworker, least preferred coworker, and assumed similarity of opposites scores, and the Information measures. Factor analysis of these measures which were given to 146 undergraduates supports previous results that the different measures are multidimensional. 3 factors were obtained, all of which reflect differences in the way Ss construe persons of positive and negative affect. Several possible sources of the differing cognitive styles are discussed, and evidence is presented which suggests that males are harsher and more discriminating judges of others than females. (15 ref)—*Journal abstract.*

5362. Sikes, Sydnor & Singh, Devendra. (U Texas, Austin) **Obesity and compliance.** *Bulletin of the Psychonomic Society*, 1974(Sep), Vol 4(3), 176.—64 obese and 62 normal-weight undergraduates were tested to determine whether obese and normal-weight people differ in motivational strength, self-esteem, and compliance. Results show no differences between obese and normal-weight Ss on any of the measures. Findings suggest that psychological disturbances associated with obesity are not pronounced in young university populations.

5363. Smitson, Walter S. (U Cincinnati, Medical School, Central Psychiatric Clinic) **The meaning of emotional maturity.** *MH*, 1974(Win), Vol 58(1), 9-11.—Suggests that emotional maturity is the basis for inner security, for understanding oneself and others, and for

full and effective interpersonal relationships. It is viewed as an elusive process, yet attainable by those who gain self-insight or seek professional help.

5364. Snyder, C. R. (U Kansas) **Why horoscopes are true: The effects of specificity on acceptance of astrological interpretations.** *Journal of Clinical Psychology*, 1974(Oct), Vol 30(4), 577-580.—63 female undergraduates were given an identical general horoscope interpretation but were assigned randomly to 1 of 3 specificity conditions in which they were told the interpretation was (a) generally true of people, (b) derived for them on the basis of the year and month of their birth, or (c) derived for them on the basis of the year, month, and day of their birth. Results show that the more specific birth time referent the S ascribed to the astrological interpretation, the more the interpretation was accepted as an accurate description of the S's personality ( $p < .0001$ ). A discussion is made of how horoscopes may achieve "verification" or acceptance because of situation factors alone, rather than any actual relationship between astrological interpretations and an individual's observed personality. (22 ref)—*Journal summary*.

5365. Staats, Sara et al. (Ohio State U, Newark) **Internal versus external locus of control for three age groups.** *International Journal of Aging & Human Development*, 1974(Win), Vol 5(1), 7-10.—Administered Rotter's Internal-External Scale to a noncollege population of males and females in 3 age groups: 5-15, 16-25, and 46-60 yrs. Internal locus of control expectations increased with age. A trend was observed for males to be more internal in their beliefs than females.—*Journal abstract*.

5366. Tiedeman, David V. (Northern Illinois U) **Putting the backbone in self: Overview of a symposium.** *Character Potential*, 1974(Oct), Vol 7(1), 9-11.—Introduces a symposium which dealt with career, choice, and the self, and gives expression to Tiedeman's overarching interest as philosopher and educator in placing self in its own hierarchical self-reconstruction. The development of his concepts over 25 yrs is traced. Brief descriptions of the other 3 papers in the symposium are provided, indicating their interarticulation of theory and practice in the areas of decision making and self-development (see PA, Vol 53:Issue 3). (15 ref)—L. W. Barber.

5367. Vaillant, George E. (Cambridge Hosp, MA) **Antecedents of healthy adult male adjustment.** In D. F. Ricks, A. Thomas & M. Roff (Eds), *Life history research in psychopathology: III*. Minneapolis, MN: University of Minnesota Press, 1974, x, 383 p.

5368. Viney, Linda L.; Altkin, Murray & Floyd, Joan. (Macquarie U, Sydney, NSW, Australia) **Self-regard and size of human figure drawings: An interactional analysis.** *Journal of Clinical Psychology*, 1974(Oct), Vol 30(4), 581-586.—Measures from a sample of figure drawings by women who were pregnant wives, unmarried and pregnant, or neither pregnant or married ( $n = 15, 32$ , and 30, respectively) were analyzed. Membership of these groups, sex of 1st-drawn figure, number of erasures, and nature of clothing and mood of female figure were tested as predictors of the size of the female figure (height, waist size, breast size, and ratio of height and waist sizes to those of the male figure). Results

indicate that the mood of the figure alone predicted its size, as measured by height, waist, and breast. Number of erasures predicted the male-female height ratio, while sex of 1st-drawn figure predicted male-female waist ratio. Group was important only insofar as it interacted with sex of 1st-drawn figure to predict male-female height. (16 ref)—*Journal summary*.

5369. Waugaman, Richard. (Sheppard & Enoch Pratt Hosp, Towson, MD) **The intellectual relationship between Nietzsche and Freud.** *Psychiatry*, 1973(Nov), Vol 36(4), 458-467.—Analyzes F. Nietzsche's influence on Freud and compares their theories of human motivation.

5370. Zillmann, Dolf; Johnson, Rolland C. & Day, Kenneth D. (Indiana U) **Provoked and unprovoked aggressiveness in athletes.** *Journal of Research in Personality*, 1974(Aug), Vol 8(2), 139-152.—In a factorial design with 60 male undergraduates, athletic involvement (no varsity sport, varsity noncontact sport, or varsity contact sport) was varied with induced disposition (unprovoked or provoked). Under conditions of no provocation, no significant differences in aggressiveness (deliverance of noxious stimuli to an opponent) were observed between nonathletes and athletes, or between noncontact- and contact-sport athletes. In contrast, under conditions of provocation, nonathletes displayed more aggressiveness than athletes. Non-contact-sport athletes behaved significantly less aggressively than both nonathletes and contact-sport athletes. Contact-sport athletes failed to behave significantly less aggressively than nonathletes. Findings suggest an acquired superior ability in athletes to cope with provocation under competitive circumstances, which is partially counteracted in contact-sport athletes by their aggressiveness habits and disinhibition training. (16 ref)—*Journal abstract*.

## PROFESSIONAL PERSONNEL

5371. ———. **Fostering the growing need to learn: Monographs and annotated bibliography on continuing education and health manpower.** Rockville, MD: Health Resources Administration, DHEW Pub No (HRA) 74-3112, 1974, xxx, 606 p.

5372. ———. **Standards for the preparation of counselors and other personnel services specialists.** *Journal of Employment Counseling*, 1974(Sep), Vol 11(3), 133-144.—Presents guidelines for the graduate training of counselors and personnel services specialists in the areas of program objectives, curriculums and supervised experiences; the program sponsor's responsibilities for information, selection, retention, endorsement, placement, and evaluation; and support for the counselor education program, administrative relations, and institutional resources.

5373. Alston, Paul P. (East Carolina U) **Multidiscipline group facilitation training: An aid to the team approach.** *Rehabilitation Counseling Bulletin*, 1974(Sep), Vol 18(1), 21-25.—In rehabilitation settings that use a number of professionals to assist the client, the communication and cooperation existing among these groups is an important factor in the program's effectiveness. A procedure for teaching facilitative communication in

small groups whose membership included staff members from 4 professional groups (rehabilitation staff, academic school staff, correctional staff, and technical school staff) is described. Ss completed a Carkhuff communication index, a sociogram to measure perceptions of others in the groups, and semantic differential ratings of attitudes toward other professions before and after the 15-wk communication training program. Results show that staff members experienced significant improvement in communication skills and perceptions of each other, while their perceptions of the various professionals represented in the groups were unchanged.—*Journal abstract.*

5374. Azam, R. **The role of the educational psychologist: Some basic strategies.** *Association of Educational Psychologists' Journal & Newsletter*, 1972(Fal), Vol 3(2), 19-26.—Describes the work of trained educational psychologists in England and Wales. The psychologist divides his time between the child guidance clinic, where he serves as a team member focusing on assessment, and the School Psychological Services, where he functions as director and deals with all the problems arising within the schools.

5375. Barkin, Roger M. (U Colorado, Medical Ctr, Denver) **Need for statutory legitimation of the roles of physician's assistants.** *Health Service Reports*, 1974(Jan-Feb), Vol 89(1), 31-36.

5376. Barlow, David H. (U Mississippi, Medical Ctr, Jackson) **Psychologists in the emergency room.** *Professional Psychology*, 1974(Aug), Vol 5(3), 251-256.—Describes a training innovation in which clinical psychology interns are on 24-hour-a-day call to an emergency room in rotation with psychiatric residents. The psychology intern is called in by the medical intern, checks the chart, interviews the patient, formulates the problem, and makes a disposition. Interns benefit by learning to deal with crises, becoming aware of possible physical contributions to emotional problems, and coordinating efforts of many individuals. Trainees report increased self-confidence and rate the program favorably.—C. Wright.

5377. Beisser, Arnold R.; Shahan, John M. & Olander, Helen L. **Assessing educational need: A resurvey of need for education among community mental health professionals.** *California Mental Health Research Monograph*, 1973, No 15, 70 p.—Describes a 1969 survey which followed up and extended one conducted in 1966, both designed to ascertain the educational needs of mental health professionals in southern California. In 1966, 1,000 questionnaires were sent out and 389 replies were received. In 1969, 544 forms were sent and 458 answers were elicited. 1969 replies are reported and analyzed in detail, and compared with those given in 1966 as a guide to trends in this rapidly changing field. Continued interest in educational courses was expressed, although actual participation was sometimes prevented by problems of time, distance, and course schedules. All categories of respondents expressed interest in clinically oriented courses except administrators, who showed greater interest in administrative courses. Most respondents wished to spend more time in activities involving direct, active delivery of services, less time in organizational work. Suggestions are made for improving future

surveys: selection of a more representative sample, development of a shorter questionnaire, and use of a preliminary pilot study.—G. E. Zimmerman.

5378. Berlin, Irving N. (U Washington) **Minimal brain dysfunction: Management of family distress.** *JAMA: Journal of the American Medical Association*, 1974(Sep), Vol 229(11), 1454-1456.—Considers that the diagnosis and adequate treatment of minimal brain dysfunction (MBD) requires very early identification of neurophysiologic and behavioral disturbances. Comprehensive care of this disorder requires early involvement of parents in understanding the diagnosis and its implications and in learning about infant management. It is stressed that whether stimulant medication works or not, the very early socialization patterns which govern reactions to discipline, learning, and interpersonal relations, once acquired, are difficult to change and affect the child's entire life. It is suggested that the physician should help parents with the frequent feelings of blame and serve as a model of how the child's problems can be openly and honestly discussed with him. (17 ref)—*Journal abstract.*

5379. Blockstein, William L. (U Wisconsin, Extension, Health Sciences Unit) **Groping toward a national policy involving regional efforts for improved health-service delivery.** In *Fostering the growing need to learn: Monographs and annotated bibliography on continuing education and health manpower*. Rockville, MD: Health Resources Administration, DHEW Pub No (HRA) 74-3112, 1974. xxx, 606 p.—Discusses selected elements in the evolving national health strategy and relates these to regional approaches to improving health service and continuing education for health manpower. Ongoing attempts at regionalized health-care programs are examined, and the experiences of the Wisconsin Regional Medical Program are described in detail. The concepts of health maintenance and the area health education and service center are also considered.

5380. Bolton, Brian. **Three verbal interaction styles of rehabilitation counselors.** *Rehabilitation Counseling Bulletin*, 1974(Sep), Vol 18(1), 34-40.—Attempted to identify empirically patterns of verbal interview behavior in a national sample of rehabilitation counselors. Obverse factor analysis of the subrole profiles (using the Rehabilitation Counseling Interview Subrole Behavior Scale by B. K. Richardson et al) of 54 counselors produced 3 interaction styles: (a) information providers, who provide general administrative information, specific details about services, and information tailored to the client's needs; (b) therapeutic counselors, who listen, explore, reflect, and provide support to their clients; and (c) information exchangers, who solicit information from clients, provide educational and occupational information, discuss various topics, and offer advice. The 3 groups of counselors were compared on 50 self-report variables and 3 interpersonal skills (empathy, respect, and genuineness) to further define the styles. Results provide evidence of relationships among counselor training, job function, and verbal interaction style.—*Journal abstract.*

5381. Bonk, Edward C. & Jansen, David G. (North Texas State U) **Correlations between the Guilford-Zimmerman Temperament Survey and rankings of counseling competency.** *Journal of Counseling Psychology*

gy. 1974(Nov), Vol 21(6), 575-576.—Studied the relationships between Guilford-Zimmerman Temperament Survey raw scores and supervisor and peer rankings of competency for 107 male and 103 female master's degree practicum counselors. Correlations of .45 for males and .50 for females between supervisor and peer rankings were observed. 4 of the 10 scales correlated .40 or more with the supervisor rankings of competency for both male and female Ss. Overall, the scales correlated significantly better with supervisor rankings than with peer rankings for both sexes. Computation of multiple correlations between selected scales and the criteria suggested that even the best 2-scale combinations were only minimally more predictive of either supervisor or peer rankings than the best individual scale predictors. —*Journal abstract.*

5382. Bornstein, Philip H. & Spitzform, Marianne. (U Montana) **Institutional sources of research in major behavioral journals: 1970-1973.** *Behavior Therapy*, 1974(Oct), Vol 5(5), 661-664.—In a survey of 4 major behavioral journals, no institution clearly dominated the field, and a wide variety of settings and facilities were apparently engaged in behavioral research. Institutions previously identified as having placed emphasis upon training in behavior therapy-behavior modification are examined in light of the above findings.

5383. Bryson, Seymour; Renzaglia, Guy A. & Danish, Steven. (Southern Illinois U, Rehabilitation Inst) **Training counselors through simulated racial encounters.** *Journal of Non-White Concerns in Personnel & Guidance*, 1974(Jul), Vol 2(4), 218-223.—Presents a tentative model for training individuals to become more aware of their racial attitudes and to develop more effective behaviors in working with blacks. Based on the hypothesis that many white counselors would experience some feelings of uneasiness with emotional reactions of blacks, the training program revolves around a stimulus film, which consists of a series of simulated emotional vignettes, in each of which a black youngster role-plays a prescribed reaction to the helping other. After viewing the film, trainees focus on (a) identifying the emotions expressed by the role-players; (b) identifying their feelings and reactions to the simulated clients; and (c) expressing, either in written form or orally, their responses to the vignette player. Illustrations of other exercises in the training program are provided.—*M. E. Pounsel.*

5384. Canning, Curt; Kane, Robert & Gray, Robert. (Fort Logan Medical Health Ctr, Denver, CO) **Attitudes and electives: Predicting enrollment and measuring effects.** *Journal of Medical Education*, 1974(Oct), Vol 49(10), 986-988.—Used sociological scales to measure the attitudes of 2 cohorts of medical students at the beginning of an elective freshman curriculum in community and family medicine and again 1 yr later. Analysis of the data showed that students who did not elect courses in these areas tended to be more authoritarian, more dogmatic, and more cynical than students who did.

5385. Charters, Alexander N. & Blakely, R. J. (Syracuse U) **The management of continuing learning: A model of continuing education as a problem-solving strategy for health manpower.** In *Fostering the growing need to learn: Monographs and annotated bibliography on continuing education and health manpower.* Rockville,

MD: Health Resources Administration, DHEW Pub No (HRA) 74-3112, 1974. xxx, 606 p.—Presents a model in a sequence of steps for the management of continuous education for health manpower, based on the view that this education is a problem-solving process. Problems in planning and teacher training for health manpower education are considered as well as the impact of continuing education on health care. (64 ref)

5386. Crawley, Lawrence Q.; Malfetti, James L. & Bartholomew, F. E. (Lenox Hill Hosp, New York, NY) **Sex education for school physicians: Follow-up of an inservice training course.** *Family Coordinator*, 1974(Oct), Vol 23(4), 359-364.—Reports the results of a follow-up survey of 32 physicians who had 1 yr earlier participated in an inservice course for school physicians involved in sex education programs. At the end of the course, 29 physicians had said they would participate in sex education programs; however, 1 yr later, only 12 reported actual involvements. The largest gap between intention and actual participation occurred in the area of parent and community relationships and activities; although 21 Ss had intended to do something in this area, only 2 reported any subsequent activity. Factors influencing involvement were identified, including preoccupation with other issues and the controversial nature of sex education programs in general. The need for more objective attitudes and more actual involvement in sex education programs is stressed. (17 ref)—*L. Gorsey.*

5387. Dawidoff, Donald J. **Legal advice for psychiatrists.** *MH*, 1974(Win), Vol 58(1), 24-25.—Discusses some of the more common risks involved in the practice of psychiatry. These include civil malpractice, drug therapy, commitment, undue influence, transference, and criminal conduct. Suggestions are offered for avoiding or mitigating these risks.

5388. de la Torre, Jorge & Appelbaum, Ann. (Meninger Clinic, Topeka, KS) **Use and misuse of clichés in clinical supervision.** *Archives of General Psychiatry*, 1974(Sep), Vol 31(3), 302-306.—Considers that beginning psychiatrists use technical jargon as a defense against the anxiety stirred by their new tasks. Jargon is a special case of the cliché, an empty truth replacing genuine understanding with an affectively neutral pseudounderstanding. At the outset of training, clichés provide a false sense of knowledgeableness, help the resident to feel like a member of the institutional group and of his discipline, and serve as a substitute for clear thinking. As a temporary defense, as well as an early stage of identification with psychiatry, the use of clichés should be respected. They serve as indicators of the resident's progress, being used with increasing sophistication by those who are growing professionally. Persistent confrontation helps arouse curiosity about clichés and promotes their transformation into concepts. (20 ref) —*Journal abstract.*

5389. Dickinson, Gary & Verner, Coolie. (U British Columbia, Vancouver, Canada) **The provision of inservice education for health manpower.** In *Fostering the growing need to learn: Monographs and annotated bibliography on continuing education and health manpower.* Rockville, MD: Health Resources Administration, DHEW Pub No (HRA) 74-3112, 1974. xxx, 606 p.—Discusses the functions, organization, and tasks of

inservice education for health manpower in health-service institutions. Tasks include determination of learning needs, specification of goals and objectives, selection of instructional processes, organization of learners, and evaluation.

5390. **Fleisher, Daniel S.** (U of the Pacific, School of Medical Sciences, Pacific Medical Ctr) **Priorities and data bases: Their relationship to continuing education.** In *Fostering the growing need to learn: Monographs and annotated bibliography on continuing education and health manpower*. Rockville, MD: Health Resources Administration, DHEW Pub No (HRA) 74-3112, 1974. xxx, 606 p.—Describes a 13-step process by which an individual or a group of health-care providers can make systematic decisions regarding the identification and possible remedy of deficiencies in the care of patients. The need to set priorities and to rely on objective data is stressed. The model has been shown to improve decision-making and cooperation in health-care delivery.

5391. **Florander, Jesper.** [The school psychologist's possibilities for research in education.] (Danish) *Skolepsykologi*, 1974, Vol 11(5), 364-373.—Describes a realistic and workable model for training school psychologists in educational research through a 2-yr membership in the local research and development team. To support this plan it is suggested that the Danish Institute for Educational Research should offer postgraduate training and assistance.

5392. **Fry, Lincoln J. & Miller, Jon P.** (U California, Camarillo Neuropsychiatric Inst Research Program, Los Angeles) **The impact of interdisciplinary teams on organizational relationships.** *Sociological Quarterly*, 1974(Sum), Vol 15(3), 417-431.—Based upon research in an alcoholism treatment organization, the impact of interdisciplinary team treatment on organizational participants and structure was studied. Ss were 15 social service aides, 35 professional team members, and 8 administrative and supervisory personnel. Findings suggest that alternate organizational arrangements are necessary for organizations which use the team method. The implications of team treatment for professionals were confounded because of power relationships within the organization. Role bargaining between professionals was virtually nonexistent because of the dominance of a single discipline. A surprising finding was the extent to which supervisory personnel were disadvantaged in the study. Caution is suggested for those organizations most likely to adopt the team method (i.e., large public health organizations). (17 ref)—*Journal abstract*.

5393. **Goroll, Allan H.; Stoeckle, John D. & Lazare, Aaron.** (Massachusetts General Hosp, Boston) **Teaching the clinical interview: An experiment with first-year students.** *Journal of Medical Education*, 1974(Oct), Vol 49(10), 957-962.—Describes and evaluates an experimental clinical course in history-taking for 1st-yr medical students. Results of this small-scale experiment suggest that preclinical students can learn to interview ambulatory patients effectively without compromising patient care.

5394. **Grace, Mary J.** (Sequoia Hosp, Redwood City, CA) **The psychiatric nurse specialist and medical-surgical patients.** *American Journal of Nursing*, 1974(Mar), Vol 74(3), 481-483.—Presents case illustra-

tions of the role of the psychiatric nurse specialist in a hospital medical-surgical area in relation to 3 groups: (a) patients facing major life adjustments, (b) families confronted with a relative's health problem, and (c) nursing staff having difficulty with particular patient situations. Psychiatric nursing skills in assessment, communication, and liaison functions are discussed.

5395. **Greenblatt, Milton.** (U California, Los Angeles) **Psychopolitics.** *American Journal of Psychiatry*, 1974(Nov), Vol 131(11), 1197-1203.—Discusses the political and power conflicts that occur in the fields of psychiatry and mental health, the particular vulnerability of human service agencies to political pressure in funding and staffing, the role of the press in "creating" news, and the need for regulating the media and insuring its accountability.

5396. **Grzegorek, A. E. & Kagan, N.** (Kent State U, Consultation & Training Services) **A study of the meaning of self-awareness in correctional counselor training.** *Criminal Justice & Behavior*, 1974(Jun), Vol 1(2), 99-122.—Determined the effects of affective and cognitive approaches to counselor training on the subsequent counseling behaviors of 44 correctional counselors. The affective approach emphasized counselors' feelings and personal growth, while the cognitive approach emphasized only the learning of client feelings and dynamics and the development of counseling skills. 4 types of tasks were used in the 10-day training programs: lectures and discussions of facilitative counseling as defined by C. B. Truax and R. R. Carkhuff, simulated confrontation, the videotaped Interpersonal Process Recall (IPR) procedure, and group reviews and discussions of individual videotaped client contacts. Criterion measures included the Affective Sensitivity Scale by N. Kagan et al, the Counselor Verbal Response Scale, and the Empathic Understanding in Interpersonal Process Scale. Only the trainees in the affective training groups had significantly higher scores (pre- to posttest) on the 3 criterion measures, particularly in areas related to counselor performance. There were no major differences between groups in skills related to the perception of client feelings and reactions.—*L. Gorsey*.

5397. **Henderson, Harold L.** (Bowling Green State U) **Using the helping relationship inventory for assessing and developing counselor response styles.** *Rehabilitation Counseling Bulletin*, 1974(Sep), Vol 18(1), 60-63.—Describes a method to assist counselor trainees in assessing and developing their counseling styles. The emphasis is away from indoctrination toward any one approach to counseling and toward facilitating the trainees' achievement of their own goals. Particular attention is given to the incongruencies that occur between expressed, inventoried, and manifest counseling behavior, and some possible explanations and trainer intervention are discussed. The usefulness of Jones's Helping Relationship Inventory in achieving these goals is also examined.—*Journal abstract*.

5398. **Holden, Constance.** **Sex therapy: Making it as a science and an industry.** *Science*, 1974(Oct), Vol 186(4161), 330-334.—Discusses the rapid growth of sex research, sex training, sex education, and sex therapy programs in the US and the consequent problems in accrediting and certifying the competence of the thera-

pists involved and the procedures they use. Several major programs are described (e.g., Masters and Johnson), and plans to organize, train, and possibly license sex therapists are discussed.

5399. **Howe, Herbert F.** (U Nebraska) **An empirical description of a community-clinical training program.** *Professional Psychology*, 1974(Aug), Vol 5(3), 277-285. —Proposes a model for empirical description of community-clinical psychology programs that was tested with 7 faculty and 28 graduate students. Data indicate that the majority of time was spent in purely clinical work. Students spent more than 1/2 of their time on academic and professional activities, and they also spent more time at the clinical end of a clinical-community psychology continuum. It is concluded that use of the model is feasible, it did reflect major changes in the program as they occurred. Wide application of this model is suggested as a way to enable applicants to make more informed educational decisions.—C. Wright.

5400. **Hutchison, Dorothy J.** (U Wisconsin, Extension) **The process of planning programs of continuing education for health manpower.** In *Fostering the growing need to learn: Monographs and annotated bibliography on continuing education and health manpower*. Rockville, MD: Health Resources Administration, DHEW Pub No (HRA) 74-3112, 1974. xxx, 606 p.—Discusses criteria for planning, implementing, and evaluating continuing education programs for health science professionals on a regional basis. Curriculum content, format, and learning techniques are described. (33 ref)

5401. **Ingram, Gilbert L.** (Federal Correctional Inst, Tallahassee, FL) **Graduate training in a correctional setting.** *Criminal Justice & Behavior*, 1974(Jun), Vol 1(2), 162-169.—Discusses the need for graduate programs in correctional psychology and criminology and some common problems encountered by graduate students who study correctional techniques and/or judicial administration procedures. An example of a graduate program in correctional psychology at Florida State University is presented, emphasizing the portion of the program which is actually conducted in a correctional facility.

5402. **Jason, Hilliard.** (Michigan State U, Office of Medical Education) **The health-care practitioner as instructor.** In *Fostering the growing need to learn: Monographs and annotated bibliography on continuing education and health manpower*. Rockville, MD: Health Resources Administration, DHEW Pub No (HRA) 74-3112, 1974. xxx, 606 p.—Focuses on the responsibilities of health-care practitioners as instructors of others and the ways in which they can fulfill these responsibilities. Major topics include the instructional process from planning to evaluation; the rationale, goals, and techniques used by the practitioner as teacher of students and patients; and the development of the practitioner-instructor. (84 ref)

5403. **Karpatschof, Benny.** (U Copenhagen, Denmark) **[The psychologist and the statistician.]** (Danish) *Skolepsykologi*, 1974, Vol 11(5), 418-422.—Discusses the 3 roles that may be played by the statistician in psychology: technician, midwife, or collaborator participating in all decisions. It is noted that statistical models are simplified

representations of reality and should be critically tested in every case.

5404. **Katchadourian, Herant A.** (Stanford U) **The psychiatrist as university ombudsman.** *Psychiatry*, 1973(Nov), Vol 36(4), 446-457.—Discusses personal experiences as a university ombudsman and the implications for a psychiatrist in terms of traditional roles.

5405. **Knox, Alan B.** (U Illinois) **Life-long self-directed education.** In *Fostering the growing need to learn: Monographs and annotated bibliography on continuing education and health manpower*. Rockville, MD: Health Resources Administration, DHEW Pub No (HRA) 74-3112, 1974. xxx, 606 p.—Presents guidelines for health science professionals to become more self-directed in continuing their education. 5 components of the "mentor" role in this context are identified, strategies for alternating between action problems and knowledge resources are described, and examples of ways to use the proposed self-directed approach are presented. (62 ref)

5406. **Lessinger, Leon M.** (U South Carolina, Coll of Education) **Effective caring: An approach to a rational scheme for financing continuing education for health manpower.** In *Fostering the growing need to learn: Monographs and annotated bibliography on continuing education and health manpower*. Rockville, MD: Health Resources Administration, DHEW Pub No (HRA) 74-3112, 1974. xxx, 606 p.—Uses a systems approach to discuss the objectives and financing of continued education programs for health manpower. Focus is on accountability and humanism as subsystems of effective caring. The cost and effectiveness of continued education programs are considered.

5407. **Lewis, Ann.** (Regional Medical Programs, Area VII, La Jolla, CA) **The use of analytical techniques to determine health manpower requirements for educational planning: or How do I find out what skills and knowledges to teach?** In *Fostering the growing need to learn: Monographs and annotated bibliography on continuing education and health manpower*. Rockville, MD: Health Resources Administration, DHEW Pub No (HRA) 74-3112, 1974. xxx, 606 p.—Suggests that in order to plan the teaching of health workers, the educator needs to know (a) the kinds of occupations currently engaged in similar work, (b) the number of persons that need to be trained, and (c) the exact knowledge and skills required by the group of workers in the function under consideration. Methods for analyzing each of these factors are discussed, and research findings are outlined. (23 ref)

5408. **Lickorish, John R.** (Ipswich Hosp, Inst of Family Psychiatry, England) **Helping the helpers.** *Association of Educational Psychologists' Journal & Newsletter*, 1972(Fal), Vol 3(2), 27-31.—Outlines the kind of training scheme which might enable nonprofessionals to become "helpers" (paraprofessionals) and work alongside professionally qualified members of the social services in counseling. The selection process could utilize any suitable technique currently used by psychologists. The 9-mo training program would involve the following stages: (a) reading and seminars in general and abnormal psychology, (b) discussion to assimilate and integrate the knowledge acquired, (c) observation of the

counseling process, and (d) participation.—*I. L. Zimmerman.*

5409. McRee, Christine; Corder, Billie F. & Haizlip, Thomas. (Dorothea Dix Hosp, Regional Child Psychiatry Residency Training Program, Raleigh, NC) **Psychiatrists' responses to sexual bias in pharmaceutical advertising.** *American Journal of Psychiatry*, 1974(Nov), Vol 131(11), 1273-1275.—Of the psychiatrists responding to a questionnaire, 45% perceived pharmaceutical advertisements from a randomly selected issue of a professional journal as showing sexual bias that might negatively influence physicians' perceptions of women. Respondents' perceptions of the predominance of women "patients" and sexually biased advertising copy in drug advertisements are reported.

5410. Milan, Mikuláš. (Research Inst of Pedagogy, Bratislava, Czechoslovakia) **[The set and process of learning.]** (Czech) *Jednotná Škola*, 1974(Jun), Vol 26(6), 539-553.—Discusses the activity of the Georgian school of psychology (founded in 1921 by N. Uznadze) and its emphasis on the experimental investigation of unconscious psychological processes. Attention is drawn to the frequent use of the term "subconscious mind" in current literature and discussion, and experimental results of Georgian and other researchers are noted. The author's research into the processes of the unconscious mind is explained, and mathematical methods are used to evaluate documented observations, a method found only sporadically in the works of Georgian psychologists. It is emphasized that discovering factors of the unconscious means broadening the impact of conscious self-knowledge and of the possibility of consciously controlling behavior. (Russian summary)—*English summary.*

5411. Miller, Michael H. (Vanderbilt U, School of Nursing) **Work roles for the associate degree graduate.** *American Journal of Nursing*, 1974(Mar), Vol 74(3), 468-470.—Studied the relationship of postgraduate nursing roles to training of associate degree nurses. Questionnaires were mailed to 190 graduates of associate degree nursing programs in Tennessee, and 49% were returned. The respondents were white, married, female nurses 20-27 yrs old. The questionnaire focused upon the nurses' training and their employment after graduation. Respondents also completed the Nursing Attitude Scale developed by M. H. Miller (unpublished paper, 1973). Results indicate that nurses with associate degrees were working in supervisory roles without previous management training. Almost 93% were working in hospitals, with 66% in charge nurse and nursing supervisory roles. General attitudes toward nursing were positive but only 15% desired supervisory roles. Only half reported that they would again choose associate degree programs. Implications of the results are discussed in relation to associate degree nursing programs and to the future of such programs.—*R. G. Gibson.*

5412. Morris, Richard J. (Syracuse U) **An inexpensive, easily built "bug-in-the-ear"/intercom system for training therapists in behavior modification techniques.** *Behavior Therapy*, 1974(Oct), Vol 5(5), 685-686.

5413. Moser, Adolph J. (Indiana Youth Ctr, Plainfield) **A systematic model for therapists and trainers.** *Criminal Justice & Behavior*, 1974(Jun), Vol 1(2), 170-182.—Presents a systematic step-by-step problem-

solving model for trainers and therapists for increasing professional accountability for client change. Effecting change in the direction of various therapeutic goals is viewed as a process involving 3 primary therapist functions—understanding the patient's problem, executing intervention therapy, and evaluating treatment.

5414. Nash, Michael M. (Florida State U) **Parameters and distinctiveness of psychological testimony.** *Professional Psychology*, 1974(Aug), Vol 5(3), 239-243.—Clarifies legal expectations of the psychologist as expert witness in order to reduce anxiety in the profession regarding this role. 3 levels of judgment in testimony are described: (a) statistical—explaining empirical data to jury, (b) clinical—presenting opinions validated by the clinician's training and experience, and (c) sanity judgments—aiding juror interpretation of (a) and (b). The necessity for confining testimony to the individual psychologist's realm of competence and the instructive function of the expert witness are stressed.—*C. Wright.*

5415. Orcutt, Ted L. & Williams, George A. **Toward a facilitative ethic in the human potential movement.** *Interpersonal Development*, 1973-1974(Aug), Vol 4(2), 77-84.—Renewed criticism of alleged irresponsibility in the human potential movement indicates a need for an explicit valuational basis upon which to construct a humanistic facilitative ethic for group facilitators and therapists. Moving toward a facilitative ethic is complicated by professional demands for standards of ethical behavior. Objective, subjective, and imperative valuing processes are discussed. Verificational criteria, exploring reasons underlying values by facilitator and participant (client) in the training situation itself, are required for authentic facilitation in the existential encounter. (21 ref)—*Journal abstract.*

5416. Ossorio, Peter G. (Ctr for Behavioral Studies, Boulder, CO) **Never smile at a crocodile.** *Journal for the Theory of Social Behaviour*, 1973(Oct), Vol 3(2), 121-140.—Suggests ways to increase the success of interaction between psychologists and philosophers. The appropriate model is seen as that of assimilation rather than of simple exchange. A conceptualization of behavior together with elaborations and heuristic distinctions is presented. The historical relationship between psychology and philosophy is discussed. The methodological roles of observer-describer and critic are outlined. A call is made for psychology to study the domain of behavior itself as a major prerequisite of going beyond technology and superstition toward a scientific understanding of behavior.—*R. S. Albin.*

5417. Panyan, Marion C. & Patterson, Earl T. (Lubbock State School, TX) **Teaching attendants the applied aspects of behavior modification.** *Mental Retardation*, 1974(Oct), Vol 12(5), 30-32.—Conducted 2 experiments to assess whether modeling was more effective than videotape feedback in developing proper behavior modification reinforcement procedures in 18 paraprofessionals. Results indicate that modeling was a more effective training technique than instructions or videotape feedback and that groups exposed to a film or live model performed better on subsequent training tasks than control Ss.—*Journal abstract.*

5418. Pavenstedt, Eleanor. (Tufts U, Columbia Point Health Ctr, Dorchester) **Training program for specializ-**

ed outreach workers and caretakers of high risk infants and toddlers. *Psychosocial Process*, 1974(Spring), Vol 3(1), 43-52.—Describes a training program for individuals recruited from the poverty sector of the population for the purpose of working with young children. Attempts were made to interest this population in child-rearing concepts that were essentially strange to them. The process of imitation followed by identification with the staff was used to involve the trainees with each infant or toddler assigned to them. Results of the training program were (a) trainees' control of children's aggression became more adaptive and flexible, (b) trainees came to view the child as capable of social responsiveness, and (c) trainees became more sensitive to the development of mother-infant reciprocity.—J. M. Kleinman.

5419. Pearl, Arthur. (U California, Santa Cruz) **The psychological consultant as change agent.** *Professional Psychology*, 1974(Aug), Vol 5(3), 292-298.—Discusses the roles and functions of the psychological consultant as an agent of change, proposing the following descriptive categories: (a) organizational man, (b) facilitator, (c) organizer of the powerless, and (d) leader with a goal. The difficulty of evaluating the consultant's effectiveness as a change agent is noted, and a method of self-study is suggested in which the consultant must make initial predictions about change. These are later compared with actual occurrences, and staff and client analyze the discrepancies that emerge.—C. Wright.

5420. Petersen, Rona. [Information about youth research.] (Danish) *Skolepsykologi*, 1974, Vol 11(5), 403-409.—Describes a plan sponsored and funded by 2 of the 6 national research councils in Denmark. Researchers with plans for studies of adolescence are invited to discuss with the secretariat of the 2 councils questions of coordination and economic and other support.

5421. Rhodes, William C. (U Michigan) **Principles and practices of consultation.** *Professional Psychology*, 1974(Aug), Vol 5(3), 287-292.—Proposes that consultation is a form of intervention that may occur at any of 5 specified levels common to all groups and systems: The organizational goals of the major consumers of consultant services (behavior regulating agencies at national and local levels) impact significantly on consultant activities. The mission of the consultee system and the orientation and personal dynamics of consultants are seen as important determinants of outcome. The consultant is a "constant student" who must keep abreast of societal and organizational developments.—C. Wright.

5422. Roemer, Ruth. (U California, Inst of Government & Public Affairs, Los Angeles) **Social regulation of health manpower.** In *Fostering the growing need to learn: Monographs and annotated bibliography on continuing education and health manpower*. Rockville, MD: Health Resources Administration, DHEW Pub No (HRA) 74-3112, 1974. xxx, 606 p.—Discusses governmental and voluntary mechanisms for regulating the qualifications of health-service personnel. The current situation, problems and issues, and proposed improvement strategies are discussed for the following topics: accreditation of educational programs and institutions; licensure; regulation of work settings; registration and certification; and requirements of payment programs. (4 p ref)

5423. Scharfetter, Christian. (Psychiatrische Universitäts-klinik, Zurich, Switzerland) **AMP system: Report on a system of psychiatric documentation used in some Continental countries.** In P. Pichot, R. Olivier-Martin (Eds), *Psychological measurements in psychopharmacology*. Basel, Switzerland: S. Karger, 1974. 267 p. \$35.75.

5424. Seth, George. (Queen's U, Belfast, Northern Ireland) **Psychologists in education services: Some basic principles of professional training.** *Association of Educational Psychologists' Journal & Newsletter*, 1972(Fall), Vol 3(2), 4-18.—Reviews the history of psychological services to children in the United Kingdom, tracing the 2 different traditions, one almost exclusively educational in orientation, the other more explicitly incorporating mental hygiene concepts and motivations. Differences in the ways in which psychologists have become qualified to enter the educational services have been relevant to the concept and practice of the different psychological services that grew up. The way into school psychology has consisted of an ill-considered process of accretion of qualifications. By now psychologists should have achieved the necessary wisdom, through experience, to be able to establish their own 1st principles of training. (20 ref)—I. L. Zimmerman.

5425. Slawson, Paul F.; Flinn, Don E. & Schwartz, Donald A. (U California, Neuropsychiatric Inst, Emergency Services, Los Angeles) **Legal responsibility for suicide.** *Psychiatric Quarterly*, 1974, Vol 48(1), 50-64.—Notes that suicide is a frequent basis for malpractice actions in psychiatry. A review of pertinent court decisions between 1927 and 1962 shows a distinct trend toward greater accountability for both doctors and hospitals. Recent cases in California are cited which support this trend. It is argued that stricter liability may thwart treatment by compelling a conservative posture with primary emphasis on safe custody. Court decisions which threaten or punish the agency of treatment may do so at the patient's expense. (29 ref)—*Journal abstract*.

5426. Sieger, Joseph M. (State U New York, Buffalo) **A multidisciplinary model for undergraduate education in rehabilitation.** *Rehabilitation Counseling Bulletin*, 1974(Sep), Vol 18(1), 12-20.—Argues that rehabilitation education should be based on relatively formal models that justify content and objectives in terms of some analysis of rehabilitation functioning. An undergraduate program oriented to developing multidisciplinary team competence in members of a variety of rehabilitation specialties is presented as an illustration of how such a model can be implemented. 8 categories of skills that should be included in such a program are identified—multidisciplinary collaboration, communication skills, problem-solving techniques, use of resources, and knowledge of the individual, social variables, effects of disability, and rehabilitation. A major advantage of formalizing this model is the identification of objectives which suggest necessary and appropriate evaluation and development strategies.—*Journal abstract*.

5427. Tucker, Robin C. & Snyder, William U. (U Richmond) **Ambiguity tolerance of therapists and process changes of their clients.** *Journal of Counseling Psychology*, 1974(Nov), Vol 21(6), 577-578.—Investigated the relationships between 18 student-therapists'

tolerance for ambiguity in visual perception tasks and (a) the positive affect displayed toward them by their 22 student clients, (b) changes in proportions of clients' self-reference statements, and (c) measures of improvement in clients' "adjustment." Results show an increase in clients' positive affect toward the therapists but no relationship between changes in clients' affect toward their therapists or the number of their self-reference statements and the therapists' tolerance for ambiguity. Clients of ambiguity-tolerant therapists described themselves more negatively, but all but 2 clients described themselves more favorably later in therapy. No positive correlation was obtained between client and therapist affect toward each other.—*Journal abstract.*

5428. Vander Kolk, Charles J. (State U New York, Albany) **The relationship of personality, values, and race to anticipation of the supervisory relationship.** *Rehabilitation Counseling Bulletin*, 1974(Sep), Vol 18(1), 41-46.—Assigned 41 white and 9 black graduate counseling students to 2 groups according to whether they anticipated the supervisory relationship to be more or less facilitative. It was found that those who expected the supervisor to be more empathic, respectful, and congruent did not differ on personality or value dimensions (measured by the Edwards Personal Preference Schedule and the Allport-Vernon-Linzey Study of Values) from those who expected a lower level of facilitation. Students anticipated that the relationship would be even more negative than was found in a previous study. Blacks differed from whites on how they anticipated the supervisory relationship.—*Journal abstract.*

5429. Weber, John J.; Moss, Leonard M.; Bradlow, Paul A. & Elinson, Jack. (Columbia U, Coll of Physicians & Surgeons, Psychoanalytic Clinic for Training & Research) **Predictions of outcome in psychoanalysis and analytic psychotherapy.** *Psychiatric Quarterly*, 1974, Vol 48(1), 117-149.—The written records of 1,348 patients treated at Columbia University's Psychoanalytic Clinic were studied, and clinical and diagnostic items were coded by 9 graduate psychoanalysts for electronic processing at the beginning of treatment. A follow-up questionnaire was completed by the therapists on 74 of 271 patients who continued in analysis after the therapists' graduation, to relate clinical change with predictions of outcome made at the time of the patients' admission. Predictions were associated with the type of treatment offered, with the function of the O, and with the completion of long-term analysis. (21 ref)—*Journal abstract.*

5430. Williams, Ellen W. **The current role of the psychologist in the criminal justice system.** *Corrective & Social Psychiatry & Journal of Behavior Technology Methods & Therapy*, 1974(Sum), Vol 20(3), 25-27.—Describes the role of the woman psychologist in a correctional institution as basically 3-fold. (a) She must earn the trust of the inmate population so that individual and group therapy can effectively operate. (b) She must develop a strong yet informal relationship with fellow employees in order to facilitate staff development programs. (c) Working as the liaison between the custodial officers and the inmates, she must try to instill in each the knowledge that understanding oneself rather

than hating one another is the key to rehabilitation.—*Journal summary.*

5431. Zimmerman, Thomas F. (U Illinois, Medical Ctr, Chicago) **Is professionalization the answer to improving health care?** *American Journal of Occupational Therapy*, 1974(Sep), Vol 28(8), 465-468.—Discusses the impact and potential of professionalization on health care service and education. It is questioned whether the increasing energy expended on becoming professionals and being "professions" is really serving the best needs of the patient, the student, and society; the possibility that the increasing stress on professionalism is actually compounding problems of health care delivery is examined. Professionalization may foster negative traits and behavioral patterns, including insularity within disciplines, an inability to respond to change, and a loss of personal self-esteem and motivation. It is concluded that if society's demands for health care are to be met, the medical professions must reevaluate their philosophies and become more realistic about roles and responsibilities.—*Journal abstract.*

## PHYSICAL AND PSYCHOLOGICAL DISORDERS

5432. Benfari, Robert C. et al. (Harvard U, School of Public Health, Boston) **The manifestation of types of psychological states in an urban sample.** *Journal of Clinical Psychology*, 1974(Oct), Vol 30(4), 471-483.—From a survey of 237 males and 293 females in 6 urban census tracts, different levels of integration of people working out the business of life in the world are concluded to be represented by 6 types of populations. Each type is a form of existential manifestation of specific critical incidents and the integrative capacities of the person. The combination of the factorial study of psychological states plus the definition of types of person clusters is a means to bring the organism back into the picture. Results agree with F. C. Thorne's (1970) position that the longitudinal assessments of introspection, direct observations, streams of life history, and assessment of critical incidents are necessary to obtain a valid picture of the person's existential situation in "here and now." (15 ref)—*Journal summary.*

5444. Plutchik, Robert & DiScipio, William J. (Albert Einstein Coll of Medicine, Program Development & Clinical Research, Yeshiva U) **Personality patterns in chronic alcoholism (Korsakoff's syndrome), chronic schizophrenia, and geriatric patients with chronic brain syndrome.** *Journal of the American Geriatrics Society*, 1974(Nov), Vol 22(11), 514-516.—Obtained the personality profiles of 3 groups of long-term hospital patients by means of the Emotions Profile Index, a personality

test designed to measure 8 basic traits. The study groups included (a) 10 patients with severe chronic alcoholism who showed definite evidence of Korsakoff's syndrome, (b) 30 patients with chronic schizophrenia, and (c) 20 geriatric patients with chronic brain syndrome (CBS). The Korsakoff-alcoholic patients appeared to be gregarious, obedient, timid, and poorly self-controlled. Their profile was different from those of normal Ss and of patients with schizophrenia. However, their profile was similar to that of geriatric patients with chronic brain syndrome who were not alcoholic. The basic similarity between Korsakoff-alcoholic patients and geriatric-CBS patients suggests that a unique alcoholic personality does not exist.—*Journal abstract*.

5445. Rahe, Richard H. (US Navy Medical Neuropsychiatric Research Unit, Biomedical Correlates Div, San Diego, CA) **The pathway between subjects' recent life changes and their near-future illness reports: Representative results and methodological issues.** In B. S. Dohrenwend & B. P. Dohrenwend (Eds), *Stressful life events: Their nature and effects*. New York, NY: John Wiley & Sons, 1974. xi, 340 p.

5446. Simon, Robert J.; Fleiss, Joseph L.; Fisher, Bernice & Gurland, Barry J. (Biometrics Research, New York, NY) **Two methods of psychiatric interviewing: Telephone and face-to-face.** *Journal of Psychology*, 1974(Sep), Vol 88(1), 141-146.—Studied the effects of telephone and face-to-face interviews on the quantity and quality of historical information obtained from informants of psychiatric patients. Whenever possible the closest available relative of 105 consecutive admissions between the ages of 20 and 34 yrs was interviewed by a social scientist using a semistructured psychiatric interview consisting of 88 questions. A total of 85 informants were interviewed, 50 face-to-face and 35 by telephone. The 2 groups of informants were similar in all characteristics possibly associated with knowledge of the patient and willingness to provide information. It was found that the information elicited by one method was not significantly different from the information elicited by the other in either quantity or quality.—*Journal abstract*.

## Mental Disorders

5447. Achenbach, Thomas M. (Yale U) **Developmental psychopathology.** New York, NY: Ronald Press, 1974. vii, 726 p. \$13.95.—Presents a comprehensive overview of the historical context, major theories, research, and treatment of childhood psychopathology, emphasizing the need to view it as separate and distinct from adult psychopathology. Treatment approaches and research on their effectiveness are presented, along with the theories and descriptions of each type of disorder. (66 p ref)

5448. Aitken, R. C. (U Edinburgh, Scotland) **Assessment of mood by analogue.** In A. T. Beck, H. L. Resnik & D. J. Lettieri (Eds), *The prediction of suicide*. Bowie, MD: Charles Press Publishers, 1974. xii, 249 p.—Discusses the reliability, validity, and potential usefulness of a method of measuring mood in depressed patients with graphic bipolar rating scales—Visual Analogue Scales (VAS). The diurnal variations noted in the moods of depressed patients and the effects of drugs on mood and

sleep EEGs are noted. The effectiveness of the VAS in measuring the extent of these changes is discussed, and a case example is presented.

5449. Albert, Joel S. (Yale U, Child Study Ctr) **Sociocultural determinants of personality pathology.** In J. R. Lion (Ed), *Personality disorders: Diagnosis and management*. Baltimore, MD: Williams & Wilkins, 1974. xi, 432 p. \$21.—Discusses certain sociocultural aspects of the pathogenesis, diagnosis, and treatment of character disorders, based on the thesis that sociocultural factors do have significant effects in determining personality pathology. It is suggested that the recent increase in the incidence and prevalence of character pathology may be due to an increasingly anomic American society. (41 ref)

5450. Allen, Martin G.; Cohen, Stephen; Pollin, William & Greenspan, Stanley I. (Georgetown U, Medical School) **Affective illness in veteran twins: A diagnostic review.** *American Journal of Psychiatry*, 1974(Nov), Vol 131(11), 1234-1239.—Systematically reviewed diagnoses in the Veteran Twin Registry and found 62 pairs of twins (69 individuals) in which one or both had affective illness, a frequency of .22% (monozygotic [MZ] concordance = 33%, dizygotic [DZ] concordance = 0%, and MZ/DZ ratio  $\geq 11.5$ ). In 40 of the 62 pairs, one or both twins had unipolar depression (MZ concordance = 40%, DZ concordance = 0%, and MZ/DZ ratio  $\geq 8$ ). Bipolar depression was present in 22 pairs (MZ concordance = 20%, DZ concordance = 0%, MZ/DZ ratio  $\geq 3.2$ ). Data indicate that both environmental and genetic factors are important in the etiology of affective illness and that unipolar and bipolar illness are separate entities. (49 ref)—*Journal abstract*.

5451. Anthony, E. James. (Washington U, Medical School) **A risk-vulnerability intervention model for children of psychotic parents.** In E. J. Anthony & C. Koupernik (Eds), *The child in his family: Children at psychiatric risk: III*. New York, NY: John Wiley & Sons, 1974. xxi, 547 p.—Presents a model which indicates that when children of psychotic and nonpsychotic parents are compared, the former show a greater tendency to become clinically disturbed during childhood and adolescence and are more likely to develop psychiatric disorders and psychoses as adults.

5452. Anthony, E. James. (Washington U, Medical School) **Introduction: The syndrome of the psychologically vulnerable child.** In E. J. Anthony & C. Koupernik (Eds), *The child in his family: Children at psychiatric risk: III*. New York, NY: John Wiley & Sons, 1974. xxi, 547 p.—Reviews the research on environmental, hereditary, and physical factors in the development of psychological disorders in the "vulnerable child." It is suggested that these disorders begin in infancy and have a snowballing effect through adult life. (22 ref)

5453. Antunes, George; Gordon, Chad; Gaitz, Charles M. & Scott, Judith. (Rice U) **Ethnicity, socioeconomic status, and the etiology of p...** *Sociology & Social Research*, 1974(Jul), Vol 58(4), 361-368.—Used a research design which contrasts distress levels of Anglos, Negroes, and Mexican-Americans for 2 levels of socioeconomic status (SES) to identify mechanisms responsible for the inverse association between social class and psychological distress. Data

were obtained from 1,441 Ss representing the above 3 groups who completed a 22-item screening scale. Results suggest that social stress associated with SES is not the cause of ethnic differences in number of symptoms of distress. (25 ref)—R. V. Heckel.

5454. Asuni, Tolani. (U Ife, Neuro-Psychiatric Hosp, Nigeria) **Sociopsychological aspects of the vulnerable child, risk and mastery: Children of the modern elite in Nigeria.** In E. J. Anthony & C. Koupernik (Eds), *The child in his family: Children at psychiatric risk: III*. New York, NY: John Wiley & Sons, 1974. xxi, 547 p.—Suggests that the vulnerability displayed by elite Nigerian children is due partly to the dissimilar rearing patterns of the parents and foreparents. Problems arising from this conflict include poor school performance, drug abuse, identity and religious crises, and psychosis.

5455. Azcarate, Carlos. (U Maryland, Medical School, Inst of Psychiatry & Human Behavior, Baltimore) **Schizoid, asthenic, and inadequate personalities.** In J. R. Lion (Ed), *Personality disorders: Diagnosis and management*. Baltimore, MD: Williams & Wilkins, 1974. xi, 432 p. \$21.—Describes problems in the differential diagnosis of schizoid, asthenic, and inadequate personalities, emphasizing the need to distinguish carefully between the presenting symptoms of low energy levels, lack of enthusiasm, ineffectual responses to social demands, and seclusiveness in each case. Caution is also advised in diagnosing members of particular social movements (e.g., bohemians or hippies) as cases of personality disorder. (57 ref)

5456. Bach-y-Rita, George. (U California, Medical School, San Francisco) **Personality disorders in prisons.** In J. R. Lion (Ed), *Personality disorders: Diagnosis and management*. Baltimore, MD: Williams & Wilkins, 1974. xi, 432 p. \$21.—Discusses social influences (e.g., socioeconomic status) on the diagnosis of personality disorders in prison, the types of disorders most often found (e.g., explosive, passive-aggressive, and antisocial personalities), the effects of imprisonment on already existing disorders, and the treatment of these disorders within the limitations of a prison environment. (30 ref)

5457. Balthazar, Earl E. & Stevens, Harvey A. (U Wisconsin, Waisman Ctr on Mental Retardation & Human Development, Central Wisconsin Colony & Training School) **The emotionally disturbed, mentally retarded: A historical and contemporary perspective.** Englewood Cliffs, NJ: Prentice-Hall, 1975. xiv, 333 p.

5458. Barolo, Enrico. (U Milan, Medical School, Inst of Psychology, Italy) **[Social autism and Andersen's fables.]** (Ital) *Rivista di Psicologia*, 1972(Jan), Vol 66(1-2), 35-46.—Reviews literature treating autism as "the organization of cognitive processes in the direction of need satisfaction" (G. Murphy). Selected fables by H. C. Andersen are interpreted as illustrations of this behavior. Group pressure provides information to an individual and restructures his point of view; the outcome is group conformity. Sympathetic reactions to the fables suggest the general understanding of the principle by society. (68 ref)—J. W. Black.

5459. Barrett, Edwin T. & Logue, Patrick E. (Florida State U) **The use of the Spiral After-effect Test to differentiate chronic schizophrenics from chronic organics.** *Journal of Clinical Psychology*, 1974(Oct), Vol

30(4), 513-516.—Administered the Spiral Aftereffect Test to 35 matched pairs of male schizophrenic inpatients (each pair consisting of one chronic and one organic S). Results show that the test significantly differentiated between the 2 diagnostic groups. Although the test in this study did not have the predictive power demonstrated in previous research, it was able to improve upon the population base rates. The contributive significance of such an instrument is accentuated when the minimal time and effort needed for its administration is considered.—*Journal summary*.

5460. Beck, Aaron T. & Beamesderfer, Alice. (Philadelphia General Hosp, PA) **Assessment of depression: The depression inventory.** In P. Pichot, R. Olivier-Martin (Eds), *Psychological measurements in psychopharmacology*. Basel, Switzerland: S. Karger, 1974. 267 p. \$35.75.

5461. Beck, Aaron T.; Laude, Richard & Bohnert, Michael. (Philadelphia General Hosp, PA) **Ideational components of anxiety neurosis.** *Archives of General Psychiatry*, 1974(Sep), Vol 31(3), 319-325.—Studied the relationship between cognitions and anxiety in 32 18-40 yr old patients with anxiety neurosis. The thoughts and fantasies associated with the arousal and intensification of anxiety were mainly anticipation of physical harm and of psychosocial trauma, ranging from humiliation or rejection in certain circumstances to complete ostracism. The patients' idiosyncratic ideation involved unrealistically heightened expectations of harm; the degree of anxiety was related to the degree of credibility of the fears (to the patient) and severity of the anticipated adversity. Of 24 patients specifically questioned about having visual images, 22 reported having typical fantasies of being in danger prior to and concomitant with their anxiety attacks. Verbal cognitions related to danger were reported in all cases. (15 ref)—*Journal abstract*.

5462. Bedoret, J. M.; Destombes, A. & Warot, P. **Psychotic episode in an anorexia nervosa: The role of isolation.** (Fren) *Acta Psychiatrica Belgica*, 1973(Jul), Vol 73(4), 437-447.—Presents the case of a 17-yr-old girl with anorexia nervosa, who experienced a psychotic episode after being hospitalized. The importance of separation from the family is emphasized, both in the development of psychotic symptoms and in the recovery process. (Dutch, English, German, Italian, & Spanish summaries) (16 ref)

5463. Björnsson, Sigurjón. (U Iceland, Reykjavik) **Enuresis in childhood: Its incidence and association with intelligence, emotional disorder, and some social and educational variables.** *Scandinavian Journal of Educational Research*, 1973, Vol 17(3), 63-82.—In 1,098 5-15 yr old children, the morbidity risk of enuresis was 12.5% and the incidence was 7.5%. Enuresis was positively associated with emotional disorder, thumb-sucking, undisciplined and negativistic behavior, adjustment and behavior problems in school, lower socioeconomic status, large families, cold and inconsistent maternal behavior, and frequent father absences. 10-15 yr old enuretics had lower IQs than nonenuretics. (29 ref)

5464. Bloch, Dorothy. (Manhattan Ctr for Advanced Psychoanalytic Studies, NY) **Fantasy and the fear of infanticide.** *Psychoanalytic Review*, 1974(Spring), Vol 61(1), 5-31.—Describes, through a case study, a child's fear of

being killed by parents and of killing them in return. In children, this fear is matched by the child's need for the parents' love. Unconscious fantasy in which self-deception plays a major role is used to defend against the knowledge that his parents may wish to kill him. The child frequently construes that it is he who makes them hate him, in order to repress his perception of how his parents really feel. He displaces the source of his fear from his parents on to monsters and imaginary creatures to allow him to maintain a loving image of his parents.—*B. Smith*.

5465. Bogdanova, E. D.; Vostrikova, S. A. & Kurilova, I. I. [In vitro determination of nucleic acids in lymphocytes of schizophrenic patients.] (Russ) *Zhurnal Nevropatologii i Psikiatrii*, 1972, Vol 72(8), 1183-1188.—Found that the amount of RNA in lymphocytes of 27 schizophrenic patients after a 1-hr culture had significantly increased compared to that in the lymphocytes of 20 healthy donors. DNA in 48- and 72-hr S cultures also increased. The addition of phytohemagglutinin (PHA) to S cultures did not cause an increase in RNA as it does in lymphocytes of normals. PHA added to 2- to 3-day S cultures demonstrated a decreased synthesis of RNA and DNA compared to the reaction of lymphocytes in normals. (English summary) (16 ref)—*J. Larsen*.

5466. Bosma, Willem. (U Maryland, Medical School, Baltimore) **Alcoholism and personality disorders.** In J. R. Lion (Ed), *Personality disorders: Diagnosis and management*. Baltimore, MD: Williams & Wilkins, 1974. xi, 432 p. \$21.—Reviews some recent findings on alcoholism and some theories about its etiology and the prealcoholic personality. Characteristics of alcoholic personality subgroups—neurotic, psychotic, and addictive drinkers—are described, and suggested treatments for each type are discussed. (25 ref)

5467. Boyar, R. M. et al. (Montefiore Hosp & Medical Ctr, Inst for Steroid Research, Bronx, NY) **Anorexia nervosa: Immaturity of the 24-hour luteinizing hormone secretory pattern.** *New England Journal of Medicine*, 1974(Oct), Vol 291(17), 861-865.—8 17-23 yr old women with anorexia nervosa associated with amenorrhea showed age-inappropriate luteinizing-hormone secretory patterns that resembled those found in prepubertal and pubertal children. This finding suggests that a regression or an arrest of the luteinizing-hormone secretory program occurs in this disorder. The finding of a relation between body weight and the maturity of the luteinizing-hormone pattern supports the hypothesis that a critical body weight is an important factor in the initiation of menarche. (24 ref)

5468. Bösörményi, Z. & Villeneuve, A. (Central State Hosp for Nervous & Mental Diseases, Budapest, Hungary) **A comparative study of psychoses following childbirth in Hungary and Quebec.** *Confinia Psychiatrica*, 1974, Vol 17(2), 111-121.—Studied the records of 2 groups of 100 women each, one from a Budapest hospital and one from a Quebec hospital, who in 1953-1969 experienced psychotic episodes during the 1st 6 mo after childbirth. 30% of the Hungarians and 33% of the French-Canadians were diagnosed as manic-depressive, and 42% of the former group and 41% of the latter were diagnosed as schizophrenic. Average age of the Hungarians was 26 yrs, of the French-Canadians 29 yrs. 56% of

the Hungarians had onset of the psychosis after the 1st childbirth and 3% after 5 or more children, compared with 18% and 27% respectively for the French-Canadians. It is suggested that a history of previous mental disorder, with or without childbirth, identifies a pregnant patient as a psychiatric risk.—I. N. Mensh.

5469. Braff, David L. & Beck, Aaron T. (U California, Langley Porter Neuropsychiatric Inst, San Francisco) **Thinking disorder in depression.** *Archives of General Psychiatry*, 1974(Oct), Vol 31(4), 456-459.—Administered the Shipley-Institute of Living Scale for Measuring Intellectual Impairment, the Beck Depression Inventory, and the Gorham Proverbs Test to 24 schizophrenics, 19 depressives, and 24 normals (age range for patient groups, 18-65 yrs). Depressives and schizophrenics showed a clear abstraction deficit compared with normals, and schizophrenics exhibited a greater deficit than depressives. When degree of depression was correlated with abstraction deficit, an important overall relationship was observed; however, this relationship did not hold consistently within the 3 groups, making this finding difficult to interpret. The need to further characterize a "cognitive profile" of patients along both diagnostic lines and dimensions (e.g., degree of depression) is stressed; this has implications for nosology and differential diagnosis, and may lead to indexes for monitoring drug effects. (24 ref)—*Journal abstract*.

5470. Busse, Ewald W. & Pfeiffer, Eric (Eds.). (Duke U, Medical School) **Mental illness in later life.** Washington, DC: American Psychiatric Assn, 1974. vi, 301 p. \$7.—This book is a 2-part treatment of mental health problems of the aged. Part 1 contains 12 chapters that discuss various aspects of the problem; Part 2 includes questions and responses of physicians and health professionals on theories and processes of aging, brain function and mental illness, treatment and rehabilitation, nutrition and vitamins, longevity and rejuvenators, perceptual changes, social aspects and habits, living arrangements and adaptation, and work and retirement.

5471. Carney, Francis L. (Patuxent Inst, Jessup, MD) **Psychological testing of the personality disorders.** In J. R. Lion (Ed), *Personality disorders: Diagnosis and management*. Baltimore, MD: Williams & Wilkins, 1974. xi, 432 p. \$21.—Discusses the value of psychological tests in the differential diagnosis and prediction of behavior and prognosis in therapy of personality disorders. Several major tests used in cases of character pathology (e.g., the Rorschach, WAIS, and Bender Gestalt Test) are described. It is stressed that the testing of severe personality disorders is no different from any other group; the difference lies in the results and their interpretation. (15 ref)

5472. Chiland, Colette. (U René Descartes, Paris, France) **Some paradoxes connected with risk and vulnerability.** In E. J. Anthony & C. Koupornik (Eds), *The child in his family: Children at psychiatric risk: III*. New York, NY: John Wiley & Sons, 1974. xxi, 547 p.—Results of a longitudinal study of children suggest that the critical factor determining vulnerability or resilience to risk is not the risk itself but the relationship between the risk and the person's psychological makeup, past history, individual characteristics, and similar factors.

5473. Cohen, Donald J. (Yale U, Child Study Ctr) **Competence and biology: Methodology in studies of infants, twins, psychosomatic disease, and psychosis.** In E. J. Anthony & C. Koupornik (Eds), *The child in his family: Children at psychiatric risk: III*. New York, NY: John Wiley & Sons, 1974. xxi, 547 p.—Presents 12 components of a multivariate model that emphasize the interaction between biological and psychosocial factors in studying the vulnerable child. (102 ref)

5474. Cronholm, Börje; Schalling, Daisy & Asberg, Marie. (Karolinska Hosp, Stockholm, Sweden) **Development of a rating scale for depressive illness.** In P. Pichot, R. Olivier-Martin (Eds), *Psychological measurements in psychopharmacology*. Basel, Switzerland: S. Karger, 1974. 267 p. \$35.75.

5475. Crown, Sidney. (London Hosp, England) **The Middlesex Hospital Questionnaire (MHQ) in clinical research: A review.** In P. Pichot, R. Olivier-Martin (Eds), *Psychological measurements in psychopharmacology*. Basel, Switzerland: S. Karger, 1974. 267 p. \$35.75.

5476. Davids, Anthony (Ed.). (Brown U) **Child personality and psychopathology: Current topics: I.** New York, NY: John Wiley & Sons, 1974. ix, 239 p. \$13.95.

5477. de M'uzan, Michel. **A case of masochistic perversion and an outline of a theory.** *International Journal of Psycho-Analysis*, 1973, Vol 54(4), 455-467.—Presents in detail one of the rare psychoanalytic cases which involve physical punishment rather than masochistic fantasies or other substitutes. The patient's submission to abuse and humiliation is viewed as screening excessive pride, but its constructive function, from a theoretical standpoint, may be the recovery of narcissistic integrity.

5478. del Rey Calero, J.; Otero Puime, A. & del Carmen González Rodríguez-Salinas, M. (Facultad de Medicina Autonoma, Madrid, Spain) **[Study of the immunological aspects of catatonia and other forms of schizophrenia, using the M. I. T. (Migration Inhibition Test).]** (Span) *Archivos de Neurobiología*, 1972(May), Vol 35(3), 225-248.—Reviews prior research on catatonic schizophrenia, and describes a study of immunological alterations in the disorder. The Migration Inhibition Test (MIT), originally developed by M. George and J. H. Vaughan, was applied to white cells from 124 schizophrenics. Immunological alterations, due to cellular hypersensitivity for the antigens of the central nervous system, were found in 36.4% of the patients. Clinical applications of the MIT are pointed out. (English & French summaries) (75 ref)—R. Ardila.

5479. Derogatis, Leonard R. et al. (Johns Hopkins U, Henry Phipps Psychiatric Clinic) **The Hopkins Symptom Checklist (HSCL): A measure of primary symptom dimensions.** In P. Pichot, R. Olivier-Martin (Eds), *Psychological measurements in psychopharmacology*. Basel, Switzerland: S. Karger, 1974. 267 p. \$35.75.

5480. Dracoulides, N. N. **[Deviations of the maternal instinct.]** (Fren) *Annales Médico Psychologiques*, 1974(Apr), Vol 1(4), 485-494.—Presents a typology of common deflections of the maternal instinct, with comments on their etiology and ultimate psychosocial repercussions. The 5 forms of variation of the maternal role most often observed are (a) tecnomania (strong

desire to have many babies, unaccompanied by a continuing interest in them); (b) tecnophobia (fear of procreation); (c) aphilectenia (indifference to procreation); (d) missotecnia (hate for procreation and children generally); and (e) parthenotecnia (desire to have many children, without sexual contact). Psychoanalytic treatment is recommended, aided in certain cases by a specific hormonal therapy.—H. E. King.

5481. Dzivaltovskii, S. A. [Some varieties of residual states in depressive paranoid schizophrenia.] (Russ) *Zhurnal Nevropatologii i Psikhatrii*, 1972, Vol 72(8), 1230-1235.—Studied residual states following depressive paranoid attacks in 50 schizophrenic patients. Clinical observations pointed to the possibility of gross mental regression, a development that may be reversed. In most cases this regression results from incomplete cessation of active symptoms. The most stable symptom in such residual states is reduced mental activity, which may be ameliorated somewhat by rehabilitative measures. (English summary) (28 ref)—J. Larsen.

5482. Edinger, Jack D. & Weiss, William U. (Virginia Commonwealth U) The relation between the altitude quotient and adjustment potential. *Journal of Clinical Psychology*, 1974(Oct), Vol 30(4), 510-513.—Conducted a study with 15 male college students and 15 male process schizophrenics. Intercorrelations among IQs, altitude quotients (AQs), AQ-IQ discrepancies, Rorschach Prognostic Rating Scale scores, and psychiatric status of the Ss were computed. Results suggest that AQ was no better as a measure of adjustment potential than was IQ and that IQ was a much better indicant of functional efficiency as measured by the psychiatric status of the Ss than were AQ-IQ discrepancy scores. These data seem to indicate that J. A. Jastak's AQ measure (1949) adds little prognostic value to measures of IQ.—*Journal summary*.

5483. el Sendiony, M. F. (Teachers Coll, Goulburn, NSW, Australia) The problem of cultural specificity of mental illness: The Egyptian mental disease and the Zar ceremony. *Australian & New Zealand Journal of Psychiatry*, 1974(Jun), Vol 8(2), 103-107.—Questions whether there are, in Egypt, mental sicknesses which are the specific production of the Egyptian cultural setting. The literature is reviewed and supplemented by the author's anthropological observations and Egyptian psychiatric reports. It is concluded that the psychopathological manifestations expressed in the *Rabt* and *Zar* cult phenomena which reflect the specific cultural content of the victim's society are simply local varieties of a common disease process to which human beings in general are vulnerable.—*Journal abstract*.

5484. Eron, Leonard D.; Lefkowitz, Monroe M.; Walder, Leopold O. & Huesmann, L. Rowell. (U Illinois, Chicago Circle) Relation of learning in childhood to psychopathology and aggression in young adulthood. In A. Davids, *Child personality and psychopathology: Current topics*. 1. New York, NY: John Wiley & Sons, 1974. ix, 239 p. \$13.95.

5485. Esmiol, Pattison. (Harvard U, Medical School, Boston) Personality disorders in private practice. In J. R. Lion (Ed), *Personality disorders: Diagnosis and management*. Baltimore, MD: Williams & Wilkins, 1974. xi, 432 p. \$21.—Discusses the types of personality

disorders most often handled by the psychiatrist in private practice (e.g., obsessive-compulsive, passive-aggressive, and paranoid) and the need for flexibility in choosing the most effective treatment modality. Problems of alliance and leverage in therapy (e.g., ego-syntonic and ego-dystonic behaviors, reality distortion, disturbed object relations, transference, and narcissism) are examined, and methods of assessing the extent of these problems are described. (22 ref)

5486. Feldmann, Harald. (U Göttingen, Germany, Psychiatric Clinic) [Hypochondria: Relation to body, risk-taking behavior, development.] (Germ) *Monographien aus dem Gesamtgebiete der Psychiatrie*, 1972, Vol 6, 118 p.—Discusses the phenomenology and psychodynamics of hypochondria. Experimental studies are also reported. (115 ref)

5487. Felitti, Vincent J. (Southern California Permanente Medical Group, San Diego) Hysterical blindness due to hyponatremia. *Psychosomatics*, 1974, Vol 15(3), 115-116.

5488. Fischer, Margit. (Statshospitalet, Risskov, Denmark) [Environmental factors in schizophrenia: Intrapair comparisons in monozygotic twins.] (Germ) *Nervenarzt*, 1972(May), Vol 43(5), 230-238.

5489. Gallahorn, George E. (U Maryland, Medical School, Inst of Psychiatry & Human Behavior, Baltimore) The borderline personality. In J. R. Lion (Ed), *Personality disorders: Diagnosis and management*. Baltimore, MD: Williams & Wilkins, 1974. xi, 432 p. \$21.—Discusses the diagnosis, psychodynamics, and treatment of borderline personalities, including the differential diagnosis of borderline personality vs organic syndromes, functional psychoses, or schizophrenia, and the relative effectiveness of individual or group psychotherapy, hospitalization, and medication. (19 ref)

5490. Garnezy, Norman. (U Minnesota) The study of competence in children at risk for severe psychopathology. In E. J. Anthony & C. Koupernik (Eds), *The child in his family: Children at psychiatric risk: III*. New York, NY: John Wiley & Sons, 1974. xxi, 547 p.—Describes Minnesota studies of competence as illustrations of a 4-stage research sequence for exploring the correlation between the behaviors of children presumed to be vulnerable to psychopathology, and a criterion of their qualities of competence. (30 ref)

5491. Gibson, Robert W. (Sheppard & Enoch Pratt Hosp, Towson, MD) Insurance coverage for treatment of mental illness in later life. In E. W. Busse & E. Pfeiffer (Eds), *Mental illness in later life*. Washington, DC: American Psychiatric Assn, 1974. vi, 301 p. \$7.

5492. Glebov, V. S. [Clinical and immunological correlations during development of remissions in continuous forms of schizophrenia.] (Russ) *Zhurnal Nevropatologii i Psikhatrii*, 1972, Vol 72(8), 1191-1195.—Studied the brain antigens and antibrain antibodies in the serum of 83 schizophrenic patients during the period from relapse through discharge from the hospital. A drop in immunological blood activity which occurred parallel to an improvement in the mental state, was usually prognostically favorable and was connected with subsequent good remissions. Stable or increased immunological blood activity usually corresponded to poorer remissions. (English summary)—J. Larsen.

5493. **Gorwitz, Kurt.** (Michigan State Office of Health & Medical Affairs, Lansing) **Census enumeration of the mentally ill and the mentally retarded in the nineteenth century.** *Health Service Reports*, 1974(Mar), Vol 89(2), 180-187.—Reports statistics on the mentally ill and mentally retarded that appeared in the 6 US censuses 1840-1890. Inclusion of these categories was part of a new social consciousness emerging in those decades. The figures are analyzed and their limitations considered. Factors leading to elimination of these categories after 1890 are discussed.

5494. **Gottlieb, Edward & Stone, George C.** **Psychosomatic aspects of orality and anality.** *Journal of Nervous & Mental Disease*, 1974(Sep), Vol 159(3), 182-190.—Studied possible relationships between patterns of bowel behavior and anal character traits and between certain patterns of mouth-related activity and oral character traits by administering a 186-item questionnaire to 30 male patients in each of the following diagnostic categories: ulcer, proctology, passive-dependent, obsessive-compulsive, and control. The distributions of scores on an oral trait scale and an anal trait scale approximated the normal curve for the entire sample and for each of the 5 clinical groups of patients so that neither individuals nor groups could be characterized as having or not having oral or anal tendencies but rather as having more or less of them. The passive-dependent and obsessive-compulsive patients, as expected, received the highest scores on the oral and anal trait scales, respectively; however, the mean differences were not large and there was a great deal of overlap from group to group. Many mouth and bowel habit and personal history items did not correlate with the 2 trait scales nor did they differentiate the 5 groups. (21 ref)—*Journal abstract*.

5495. **Grand, Henry G.** **The masochistic defence of the "double mask": Its relationship to imposture.** *International Journal of Psycho-Analysis*, 1973, Vol 54(4), 445-454.—Reconstructs the development of individuals who become masochistic in later life. Early dependence leads to simulated incompetence (the mask of childhood) and later to the belief that actual competence is a pretence (the mask of adulthood), as illustrated by 3 psychoanalytic case histories. It is suggested that imposture, a more severe character disturbance, has similar origins.—*C. T. Sullivan*.

5496. **Gross, Herbert S.** (U Maryland, Medical School, Inst of Psychiatry & Human Behavior, Baltimore) **Depressive and sadomasochistic personalities.** In J. R. Lion (Ed), *Personality disorders: Diagnosis and management*. Baltimore, MD: Williams & Wilkins, 1974. xi, 432 p. \$21.—Discusses problems in the differential diagnosis of depressive and sadomasochistic personalities (vs depressive neurosis). The psychodynamic functions of dysphoria, the "compromise function," deficiencies in the sense of self, and the effects of these mechanisms on both the diagnosis of a characterological condition and on the management of the case are examined.

5497. **Haggard, Ernest A.** (U Illinois, Abraham Lincoln School of Medicine, Chicago) **A theory of adaptation and the risk of trauma.** In E. J. Anthony & C. Koupernik (Eds), *The child in his family: Children at*

*psychiatric risk: III*. New York, NY: John Wiley & Sons, 1974. xxi, 547 p.—Uses a behavioral system as the basis for discussing aspects of adaptation and trauma, including a consideration of effects of changes in the individual's life cycle and status. Suggestions for preventing maladaptive states are presented. (31 ref)

5498. **Hamilton, Max.** (U Leeds, England) **General problems of psychiatric rating scales (especially for depression).** In P. Pichot, R. Olivier-Martin (Eds), *Psychological measurements in psychopharmacology*. Basel, Switzerland: S. Karger, 1974. 267 p. \$35.75.

5499. **Hauri, Peter; Chernik, Doris; Hawkins, David & Mendels, Joseph.** (Dartmouth Coll, Medical School) **Sleep of depressed patients in remission.** *Archives of General Psychiatry*, 1974(Sep), Vol 31(3), 386-391.—A group of 14 23-63 yr old remitted patients, formerly hospitalized with unipolar depression, was matched individually with a group of normal controls. All Ss slept in the laboratory for 5 consecutive nights. Although remitted patients and controls slept for about the same length of time (6½ hrs), remitted patients suffered from delayed sleep onset, showed more Stage 1 and less delta sleep, and had a slower sleep cycle. Night-by-night variability was much greater in remitted patients than in controls for practically all sleep measurements. Findings indicate that sleep was still disturbed more than 6 mo after substantial clinical recovery from depression. Finally, variability among individuals was greater for remitted patients than for controls in some sleep measurements, suggesting less homogeneity among formerly depressed patients than among controls. (35 ref)—*Journal abstract*.

5500. **Henderson, Scott.** (U Tasmania, Royal Hobart Hosp, Australia) **Care-eliciting behavior in man.** *Journal of Nervous & Mental Disease*, 1974(Sep), Vol 159(3), 172-181.—Suggests that the concept of care-eliciting behavior is an essential part of the phenomenon of attachment. The origins of this behavior in man are examined in terms of both ontogenesis and phylogenesis. The relevance of the behavior for species advantage is considered. Finally, it is suggested that morbid manifestations of care-eliciting constitute a number of psychiatric disorders previously considered to be unrelated. (51 ref)—*Journal abstract*.

5501. **Hogan, William M.; Huerta, Enrique & Lucas, Alexander R.** (Mayo Clinic, Section of Child & Adolescent Psychiatry, Rochester, MN) **Diagnosing anorexia nervosa in males.** *Psychosomatics*, 1974, Vol 15(3), 122-126.—Reports 18 typical cases of anorexia nervosa in males and reviews in detail 13 of these who were seen consecutively since 1969. Diagnostic criteria, clinical features, and laboratory findings are presented. (17 ref)

5502. **Holberg, Anne; Hysham, C. J. & Berry, N. H.** (US Navy Medical Neuropsychiatric Research Unit, San Diego, CA) **The neuropsychiatric implications of illiteracy: 20 years later.** *Journal of Clinical Psychology*, 1974(Oct), Vol 30(4), 533-535.—Hypothesized that a study of the illiteracy problem in the present US Navy would reflect the innovative changes in education, psychiatry, and the military which have occurred since W. A. Hunt and C. L. Wittson conducted their study (1951) of the psychiatric implications of illiteracy, specifically in the Navy. In the present study, data were

collected on 1,518 recruits who were assigned to the Naval Academic Remedial Training (ART) Division in an effort to raise their literacy level. 1,520 literate recruits served as a control sample. First-year discharge information was collected for both samples. Results show that 17.98% of the ART sample had been discharged for neuropsychiatric and disciplinary reasons, compared to 1.7% of the controls. Comparison of attrition rates with those from Hunt and Wittson's study show that the rates are very similar (18.83 and 4.60% for illiterates and controls, respectively). It is reasoned that Hunt and Wittson's conclusions are still valid today—that individuals who need academic remedial training are a greater neuropsychiatric risk to the military than are literates.—*B. McLean.*

5504. Ismailov, T. I. [Study of autoantibodies to DNA in schizophrenia and other neuropsychiatric disorders.] (Russ) *Zhurnal Nevropatologii i Psikiatrii*, 1972, Vol 72(8), 1188-1191.—Determined the presence of the autoantibodies in the blood of 156 schizophrenic patients, 104 patients with other neuropsychiatric disorders, and a control group. A modified passive hemagglutination reaction was used. 81.5% of the schizophrenics showed a positive reaction, as did 37.5% of the chronic alcoholics and alcoholic psychotics, 26.7% of the neurotics and psychopaths, and 29.6% of the normals. (English summary) (27 ref)—*J. Larsen.*

5505. Ives, L. A. (U Manchester, England) **Infantile autism: Some notes on recent research studies.** *Association of Educational Psychologists' Journal & Newsletter*, 1972(Fal), Vol 3(2), 47-52.—Reports the findings of a study group held under the auspices of the Institute for Mental Retardation. (22 ref)

5506. Jerotić, Vladeta. (Dragisa Misovic Hosp. Neuropsychiatric Div, Belgrade, Yugoslavia) [Psychosomatic disturbances in gynecology.] (Socr) *Anali Zavoda za Mentalno Zdravlje*, 1972, Vol 4(1), 85-91.

5507. Kecmanović, Dušan. (Neuropsychiatric Clinic, Sarajevo, Yugoslavia) [The public attitude toward mental patients and some factors underlying it.] (Socr) *Anali Zavoda za Mentalno Zdravlje*, 1972, Vol 4(1), 27-35.

5508. Klein, Donald F. (Long Island Jewish—Hillside Medical Ctr, Glen Oaks, NY) **Endogenomorphic depression.** *Archives of General Psychiatry*, 1974(Oct), Vol 31(4), 447-454.—Reviews conflicts in delineating the phenomena of depression with an emphasis on the central criterion role of the symptomatic pattern of the nonprecipitated (endogenous) depression. Depressions with similar symptomatology, regardless of precipitator or severity, are labeled endogenomorphic. A specific causal model is presented that has testable consequences in drug treatment and maintenance studies. This is a mixed model, combining both categorical and dimensional constructs. It is concluded that the terms "endogenous vs reactive" and "neurotic vs psychotic" should be used as qualifying adjectives rather than as category-defining terms, and that the behavioral syndromal appellation

should be based on the symptom complex (i.e., retarded, agitated, and dysphoric).—*Journal abstract.*

5509. Klein, Hillel. (Eitanim Government Psychiatric Hosp, Jerusalem, Israel) **Child victims of the holocaust.** *Journal of Clinical Child Psychology*, 1974(Sum), Vol 3(2), 44-47.—Discusses the oppression suffered during the holocaust, consisting of a long series of traumatic experiences aimed against the life and physical integrity of the individual. The cumulative traumatization was likely to shake the emotional basis of the individual's existence and led to a raised stimulus barrier. The return to peacetime conditions often failed to lower that barrier. The survivors suffered irrational fear of the future, subjective feelings of loneliness, and survival guilt toward murdered family members. These guilt feelings were positive in that the survivor could identify with the lost world of early childhood, protect against overwhelming anxiety and remorse, and regain his sense of a just universe.—*A. Krichev.*

5510. Koller, K. M. & Williams, W. T. (U Tasmania, Hobart, Australia) **Early parental deprivation and later behavioural outcomes: Cluster analysis study of normal and abnormal groups.** *Australian & New Zealand Journal of Psychiatry*, 1974(Jun), Vol 8(2), 89-96.—Notes that, despite high figures recorded from the normal population, early parental deprivation is commoner in psychiatric and deviant populations. This deprivation and its aftermath is qualitatively different when normal and abnormal samples are contrasted. Suicidal, delinquent, criminal, alcoholic, neurotic, socially deviant, and normal groups from earlier studies were analyzed on variables related to early parental deprivation and other family characteristics. Using cluster analysis, 3 abnormal and 2 normal groups were generated. It is concluded that the vulnerability of selected individuals in certain families is compounded when these individuals are exposed to the unique specific effects of the various types of parental deprivation. (65 ref)—*Journal abstract.*

5511. Kopp, Sheldon B. **Person envy.** *Journal of Contemporary Psychotherapy*, 1974(Sum), Vol 6(2), 154-156.—Briefly describes the case of an harassed married woman with children who fantasizes becoming the recipient of a penis organ-transplant. It is concluded that the fantasy represented a culturally-determined misleadingly symbolic expression of her legitimate human longing to fulfill her own purposes, i.e., "person envy."

5512. Kupfer, David J. et al. **First night effect revisited: A clinical note.** *Journal of Nervous & Mental Disease*, 1974(Sep), Vol 159(3), 205-212.—Notes that it has been a nearly universal practice among sleep researchers not to use the 1st 1 or 2 nights' recordings because of "adaptational artifact." The present study examined the records of the 1st 2 nights and compared them with records obtained in subsequent recordings (3rd and 4th nights). 35 psychiatric inpatients from various diagnostic groups were studied for 4 consecutive nights. Results indicate a striking constancy in nearly all sleep parameters when Nights 1 and 2 were compared to Nights 3 and 4 for the entire sample. Of the 26 sleep parameters investigated, only sleep latency differed significantly on the latter 2 nights. Similarly, no significant differences were found in comparing Nights 1

and 2 to Nights 3 and 4 in any of the diagnostic subgroups.—*Journal abstract.*

5513. Kupfer, David J.; Foster, F. Gordon & Detre, Thomas P. (Yale U, Medical School) **Sleep continuity changes in depression.** *Diseases of the Nervous System*, 1973(Apr), Vol 34(4), 192-195.—Examined the significance of sleep fragmentation in 25 depressed inpatients by making continuous nightly EEG, horizontal electro-oculogram, and submental electromyogram recordings. Time spent asleep was significantly less for Ss with considerable fragmentation of sleep than for Ss with little sleep fragmentation. Both types of patients showed a prominent reduction in delta sleep fragmentation. Both types of patients showed a prominent reduction in delta sleep and a shortened REM latency. REM sleep was also rearranged, with a much greater percentage occurring in the 1st 3rd of the night than would normally be expected. Results indicate that fragmented sleep is not an obligatory feature of depression. (16 ref)—A. Olson.

5514. Kurashov, A. S. [Affective states in the early stages of progressive paroxysmal schizophrenia with onset in adolescence.] (Russ) *Zhurnal Nevropatologii i Psikiatrii*, 1972, Vol 72(8), 1224-1229.—Studied 56 adult patients, 26 male and 30 female, diagnosed as paroxysmal schizophrenia, with depression and mania. Onset had been in adolescence. The disorders were atypical, with a tendency to protracted development and disguise by so-called pubertal crises. Clinical and psychopathological characteristics of the main types of depression and mania, precipitating factors, and their relationship to age and the course of the disease are described. (English summary)—J. Larsen.

5515. Lambo, T. Adeoye. (WHO, Geneva, Switzerland) **The vulnerable African child.** In E. J. Anthony & C. Koupennik (Eds), *The child in his family: Children at psychiatric risk: III*. New York, NY: John Wiley & Sons, 1974. xxi, 547 p.—Discusses child-rearing practices in major African cultures as a means of identifying the vulnerable child and the total influences that affect the development of the mother-child relationship in those cultures.

5516. Leaff, Louis A. (Medical Coll Pennsylvania, Philadelphia) **Psychodynamic aspects of personality disturbances.** In J. R. Lion (Ed), *Personality disorders: Diagnosis and management*. Baltimore, MD: Williams & Wilkins, 1974. xi, 432 p. \$21.—Discusses childhood patterns and characteristics of persons with character or personality disorders (e.g., passive-aggressive, sociopathic, or explosive personalities). Psychodynamic factors in symptoms of depression, impulsiveness, narcissism, ego weakness, and defensive behaviors are identified, and implications for treatment (particularly psychoanalysis) are examined. (18 ref)

5517. Lebovici, Serge & Diatkine, René (U Paris, France) **Normality as a concept of limited usefulness in the assessment of psychiatric risk.** In E. J. Anthony & C. Koupennik (Eds), *The child in his family: Children at psychiatric risk: III*. New York, NY: John Wiley & Sons, 1974. xxi, 547 p.—Evaluates the use of "normality" as a primary basis for evaluating the psychiatric risks that threaten children. Doubts are raised about the correctness of gauging these risks according to standards used for assessing pathology where the part played by so-

called cerebral factors are often overstressed, and it is suggested that psychiatric risk is not definable in terms of simple maturational problems that generate pathology.

5518. Lehmann, Laurent S. (US Air Force Medical Ctr, Wilford Hall, San Antonio, TX) **Depersonalization.** *American Journal of Psychiatry*, 1974(Nov), Vol 131(11), 1221-1224.—Describes 3 cases that demonstrate the phenomenon of depersonalization as a psychological defense in both neurotic and psychotic clinical situations. Organic, general psychiatric, and psychoanalytic theories of the etiology of depersonalization are discussed, along with suggestions for treatment and future research. Depersonalization is viewed as an indicator of intrapersonal processes in a variety of clinical situations rather than being pathognomic for a particular diagnosis. (21 ref)—*Journal abstract.*

5519. Lewis, Helen B. **Shame and guilt in neurosis.** New York, NY: International Universities Press, 1974. 525 p. \$4.95.—Analyzes the relationships between shame, guilt, and neurosis in 3 areas—the phenomenology of shame and guilt, the relationship between perceptual style and proneness to shame and/or guilt, and implications for therapeutic techniques. Case studies are included to illustrate the possibility of sex differences in the experience of shame and guilt and how the therapy for these feelings can be modified according to the patient's style. (11½ p ref)

5520. Lifton, Robert J. (Yale U, Medical School) **"Death imprints" on youth in Vietnam.** *Journal of Clinical Child Psychology*, 1974(Sum), Vol 3(2), 47-49.—Comments upon the psychological predicament of the Vietnam war veteran.

5521. Lion, John R. (Ed.). (U Maryland, Medical School, Inst of Psychiatry & Human Behavior, Baltimore) **Personality disorders: Diagnosis and management.** Baltimore, MD: Williams & Wilkins, 1974. xi, 432 p. \$21.

5525. Lowenstein, L. F. **A comparative study obtained from some objective and projective personality**

**methods.** *British Journal of Projective Psychology & Personality Study*, 1974(Jun), Vol 19(1), 21-27.—Compared objective and projective methods of personality assessment. 10 psychiatric patients were tested before and after treatment with 2 projective techniques—Thematic Apperception Test (TAT) and Sentence Completion Test (SCT)—and 3 objective scales—Maudsley Personality Inventory (MPI), Edwards Personal Preference Schedule (EPPS), and Lumdi Test (LT). Parental and self-description data were obtained. Results of these projective and objective methods agreed closely, especially the TAT, LT, EPPS, and MPI. Parental and self-assessment data and SCT results were less dependable than scores on the other tests. The parental and self-assessment data of obsessional patients agreed with objective and projective test results more closely than that of other patients. A case study an 18-yr-old male psychiatric patient, who was administered the same assessment techniques before and after treatment, illustrates further correspondences between objective and projective tests.—J. Adams-Webber.

5526. Marcus, Joseph. (Jerusalem Mental Health Ctr, Israel) **Neurological findings in children of schizophrenic parents.** In E. J. Anthony & C. Koupemnik (Eds), *The child in his family: Children at psychiatric risk: III*. New York, NY: John Wiley & Sons, 1974. xxi, 547 p. —Compared the incidence and characteristics of genetically determined vulnerability in a total of 100 urban and kibbutz school-age children. Urban Ss showed a greater degree of motor overflow than kibbutz dwellers and were also significantly more pathological on an overall score of nonoptimal functioning.

5527. Markush, Robert E. & Favero, Rachel V. (NIMH, Div of Extramural Research Programs, Ctr for Epidemiologic Studies, Rockville, MD) **Epidemiologic assessment of stressful life events, depressed mood, and psychophysiological symptoms: A preliminary report.** In B. S. Dohrenwend & B. P. Dohrenwend (Eds), *Stressful life events: Their nature and effects*. New York, NY: John Wiley & Sons, 1974. xi, 340 p.

5528. Marsella, Anthony J. & Murray, Michael D. (U Hawaii) **Diagnostic type, gender and consistency vs. specificity in behavior.** *Journal of Clinical Psychology*, 1974(Oct), Vol 30(4), 484-488.—Investigated consistency in conforming behaviors across a perceptual judgment and an attitude-change conformity task among male and female Ss classified as normal, manic-depressive, and paranoid schizophrenic ( $n = 22$  in each group). It was speculated that diagnostic and gender variables would reveal differences in consistency of conformity behavior. Results indicate that normals and manic-depressives evidenced significantly greater consistency in conformity behaviors across the 2 tasks than paranoid schizophrenics but did not differ from each other. No gender differences were found. Findings are discussed in terms of the use of moderator variables in consistency research. The need for emphasis on organismic-environment interactional research is noted.—*Journal summary*.

5529. Mastrovito, Rene C. (Cornell U, Medical School) **Psychogenic pain.** *American Journal of Nursing*, 1974(Mar), Vol 74(3), 514-519.—Discusses the etiology and treatment of psychogenic pain. Pain is made up of both psychological and organic factors with individual

variations. A distinction is made between hysterical neuroses with an onset of body dysfunctions or psychogenic loss and hysterical personality disorder with historical predisposition toward psychophysiological overreactions. The communicative meaning of an organic stressful situation through the individual's perception and interpretation provide a psychological overlay for understanding pain. Guidelines for medical and nursing management of psychological overlays to pain are reviewed.—R. G. Gibson.

5530. McKinney, William T. (U Wisconsin, Medical School, Madison) **Animal models in psychiatry.** *Perspectives in Biology & Medicine*, 1974(Sum), Vol 17(4), 529-541.—Reviews the history of the use of animal models of psychopathologic states and discusses their intrinsic validity. Models of psychosis and depression, socially-induced and biologically-induced models, and rehabilitation models for primates and other organisms are considered. (66 ref)

5531. McNeil, T. F. & Kaji, L. (Malmö General Hosp, Sweden) **Reproduction among female mental patients: Obstetric complications and physical size of offspring.** *Acta Psychiatrica Scandinavica*, 1974, Vol 50(1), 3-15.—Found no significant differences when rates of obstetric complications, deviations in prenatal development, and predischARGE neonatal disturbances were compared for 171 reproductions to female psychiatric patients and 171 reproductions to demographically matched controls. Significantly fewer of the offspring of endogenous psychotics were markedly preterm compared to controls. (30 ref)

5532. Meltzer, Herbert Y.; Sachar, Edward J. & Frantz, Andrew G. (U Chicago, Pritzker School of Medicine) **Serum prolactin levels in unmedicated schizophrenic patients.** *Archives of General Psychiatry*, 1974(Oct), Vol 31(4), 564-569.—Studied whether prolactin levels in newly admitted, unmedicated schizophrenic patients might be diminished to reflect increased dopaminergic activity in the tuberoinfundibular tract or the increases associated with psychological stress. Mean serum prolactin concentration was within the normal range in 22 patients but elevated in 2 manic patients and 1 patient with a severe anxiety state. (40 ref)

5533. Miller, Lovick C.; Barrett, Curtis L. & Hampe, Edward. (U Louisville, Medical School) **Phobias of childhood in a prescientific era.** In A. Davids, *Child personality and psychopathology: Current topics: I*. New York, NY: John Wiley & Sons, 1974. ix, 239 p. \$13.95.

5534. Monroe, Russell R. (U Maryland, Medical School, Inst of Psychiatry & Human Behavior, Baltimore) **The problem of impulsivity in personality disturbances.** In J. R. Lion (Ed), *Personality disorders: Diagnosis and management*. Baltimore, MD: Williams & Wilkins, 1974. xi, 432 p. \$21.—Discusses the concept of episodic dyscontrol as a subgroup of episodic behavioral disorders (i.e., any precipitously appearing maladaptive behavior, usually intermittent and recurrent, which interrupts the individual's life-style). The phenomenological and psychodynamic aspects of episodic dyscontrol are discussed, along with the relationship between brain dysfunction and dyscontrol behavior, the differential diagnosis of neuropathophysiological and motivational

factors in dyscontrol, and various treatment strategies. Case examples of dyscontrol are presented.

5535. **Morić-Petrović, Slavka; Jojić-Milenković, Milica & Marinkov, Milica.** (Mental Health Inst, Belgrade, Yugoslavia) [Mental hygiene problems of children evacuated after catastrophic earthquake in Skopje.] (Srrc) *Anali Zavoda za Mentalno Zdravlje*, 1972, Vol 4(1), 53-64.—Reports on child behavior patterns following a 1963 earthquake in Skopje, Yugoslavia. 632 children 6-16 yrs old, in 3 groups, were temporarily housed in 3 towns for several months after the catastrophe. Data on behavior patterns were collected by direct observation and by survey among teachers and counselors. The observed behavior (e.g., fear of starvation and subsequent increase in food intake, use of pacifier by 12-16 yr old girls, destructiveness, enuresis, and decline in school performance) reflected a high degree of anxiety and emotional insecurity. It was estimated that almost 70% of these children showed some form of disturbed behavior. It is suggested that many of these problems could have been alleviated had there been more organized care concerning daily activities, communication with parents, and staff counseling.—*P. Vrtunski.*

5539. **Natalevich, E. S.** [Some clinical and genetic correlations in schizophrenia.] (Russ) *Zhurnal Nevropatologii i Psikiatrii*, 1972, Vol 72(8), 1203-1209.—Studied the distribution of manifest schizophrenic psychoses in the families of 270 long-term schizophrenic patients. Of 3,572 relatives, 319 suffered from schizophrenia. 3 groups of families could be distinguished: (a) those characterized by secondary psychoses in the parents and siblings, in each generation in a direct line; (b) those with psychoses only in the sibs and in the side lines; and (c) those with no schizophrenia in the relatives. Clinical analysis of the development of schizophrenia in these 3 groups allows the disorder to be interpreted as dominant, recessive, or without proved heredity. On the basis of these interpretations, some differences between these groups could be established. (English summary) (46 ref)—*J. Larsen.*

5540. **Neu, Jerome.** (U California, Santa Cruz) Fantasy and memory: The aetiological role of thoughts according to Freud. *International Journal of Psychoanalysis*, 1973, Vol 54(4), 383-398.—Traces the development of Freudian ideas about the etiology of neurosis, particularly hysteria, and about the therapeutic goals of psychoanalysis. Within that context, it is argued that

"thoughts," broadly defined, play an important role in the genesis of hysteria. Theoretical excerpts and clinical examples are used in the discussion of basic concepts such as cause and effect, reality, idea and affect, memory and fantasy, wish-fulfillment, impulse, insight and abreaction, and "cure." (33 ref)—*C. T. Sullivan.*

5541. **Nussbaum, Kurt.** (US Social Security Administration, Bureau of Disability Insurance, Washington, DC) **Psychiatric disability determination under Social Security in the United States.** *Psychiatric Quarterly*, 1974, Vol 48(1), 65-73.—The Social Security Act provides disability benefits to those insured who are prevented from working by a severe medically determinable impairment. Under the Act, psychiatric impairment is assessed on the basis of demonstrable clinical manifestations including mental status examination and, where needed, by standardized psychological tests yielding quantifiable results. The total function of the person in daily living, both in the social and work spheres, is taken into consideration in the assessment process. The use of the Psychiatric Review Form is discussed, and research which aims at obtaining further progress in the classification of psychiatric concepts and arriving at greater objectivity in psychiatric decision-making is described.—*Journal abstract.*

5542. **Oberdalloff, H. E.** (U Göttingen, Psychiatrische Klinik, W Germany) [Matricide in a schizophrenic psychosis: Case report.] (Germ) *Confinia Psychiatrica*, 1974, Vol 17(2), 122-131.—Recounts the case of a 50-yr-old retired teacher who killed his 77-yr-old mother on the eve of his birthday. Family background included a schizophrenic cousin, the suicides of 2 great-uncles, and depression experienced by his mother and one of her cousins. The mother had raised him and an older brother strictly and religiously, sexuality and its discussion was taboo, and the patient had returned, after his father's death, to live with his mother. It is concluded that his upbringing prevented any attachment to other women and that he may have had to become psychotic in order to form any relationship with a woman other than his mother. This inference was suggested by the patient's statement, 6 mo after the murder that he was considering marriage.—*I. N. Mensh.*

5543. **Ohi, Masami.** (Nagoya U, Japan) [Neurotic behavior disorders in childhood.] (Japn) *Japanese Journal of Child Psychiatry*, 1972(Sep), Vol 13(5), 295-316.—Used therapeutic interviews with mothers to analyze the dynamic mother-child relationship of 10 children with problem behaviors—aggression, violence, restlessness, and rebelliousness. The child-rearing attitude of the mothers was generally one-sided, selfish, and rigid. These children, after a period of temporary neurotic regression, became selfish, stubborn, unyielding, and extremely sensitive to interpersonal relationships resulting in an increased rigidity of the mother's attitude. Since the change from "good child" to "bad child" in these cases was an expression of self-assertion, these problem behaviors should be interpreted as a developmental step in the child's personality. Play therapy with their children led the mothers to set a higher value on their role as mothers, to understand how their attitudes affected the children, and to create better relationships. (English summary) (27 ref)—*S. Ohwaki.*

5544. Ornitz, Edward M.; Brown, Morton B.; Mason, Anne & Putnam, Nicholas H. (U California, Ctr for the Health Sciences, Los Angeles) **Effect of visual input on vestibular nystagmus in autistic children.** *Archives of General Psychiatry*, 1974(Sep), Vol 31(3), 369-375.—Reports that a stimulus to oculomotor fixation in the absence of light and a retinal stimulation in the absence of ocular fixation caused greater suppression of postrotatory nystagmus in 21 36-69 mo old autistic children than in 25 38-90 mo old normal children. The former confirmed earlier reports of suppressed vestibular nystagmus in autistic children under conditions permitting optic fixation. The latter suggests a more profound interaction of visual and vestibular systems underlying the suppression of postrotatory nystagmus in autistic children than can be explained by their enhanced ability to use ocular fixation to suppress vestibular nystagmus. Data are consistent with a vestibular dysfunction theory underlying their disordered sensorimotor integration. This is further supported by a less constant time course of the vestibular response of autistic children in darkness. (37 ref)—*Journal abstract*.

5559. Rutter, Michael. (Inst of Psychiatry, London, England) **Epidemiological strategies and psychiatric concepts in research on the vulnerable child.** In E. J. Anthony & C. Koupernik (Eds), *The child in his family: Children at psychiatric risk: III.* New York, NY: John Wiley & Sons, 1974. xxi, 547 p.—Discusses 5 epidemiological research strategies for determining causes of vulnerability: background variables, particularly parental mental illness; factors in the child, such as organic brain pathology; studies of the general population; comparative studies of 2 populations; and cross-generational studies. (34 ref)

5560. Schaefer, Charles. (Children's Village, Dobbs Ferry, NY) **Sociometric status and altruistic friendship in emotionally disturbed boys.** *Journal of Social Psychology*, 1974(Oct), Vol 94(1), 143-144.—Examined the relationship between altruistic friendship and sociometric status for 65 preadolescent boys, using the Shipwreck Test (see PA, Vol 51:11315). An analysis of the sociometric data reveals that there were 10 "stars" and 12 "isolates." 9 of the 12 isolates chose to save the friend figure on the test by assigning him a lifeboat, while only 2 of the stars chose to save the friend figure.

5561. Schatzman, Morton. **Paranoia or persecution: The case of Schreber.** *History of Childhood Quarterly: The Journal of Psychohistory*, 1973(Sum), Vol 1(1), 62-88.—Criticizes Freud's analysis of Schreber as neglectful of the father's practices of child rearing. Based on the father's writings, similarities between some of the son's strange experiences and the father's methods are discussed and a theory is proposed which views paranoia as a transformation of persecution. (78 ref)

5562. Schmidt, Chester W.; Meyer, Jon K. & Lucas, Jane. (Johns Hopkins U, Medical School) **Sexual deviations and personality disorders.** In J. R. Lion (Ed), *Personality disorders: Diagnosis and management.* Baltimore, MD: Williams & Wilkins, 1974. xi, 432 p. \$21.—Based on the view that all sexual deviates have some sort of character pathology, definitions of several forms of sexual deviations are presented, the etiology of sexually deviant behavior is discussed in terms of psychodynamic and physiological factors, and evidence of the relative effectiveness of various treatment modalities for sexual deviation (e.g., psychotherapy, behavior modification, or hormonal therapy) is examined. (24 ref)

5563. Schopler, Eric. (U North Carolina, Medical School, Chapel Hill) **Changes of direction with psychotic children.** In A. Davids, *Child personality and psychopathology: Current topics: I.* New York, NY: John Wiley & Sons, 1974. ix, 239 p. \$13.95.—Discusses recent changes in thinking about research and theory in childhood psychosis or autism, emphasizing the shift from theoretic

cal to empirical thinking in the areas of classification, theories of causation, role of parents, treatment interventions, and social and ecological considerations. The need for openness to new clinical data and research findings is stressed. (2 p ref)

5564. Schubert, Josef & Bergman, Anita J. (U Saskatchewan, Regina Campus, Canada) **Developmental changes in Rorschachs of emotionally disturbed children.** *British Journal of Projective Psychology & Personality Study*, 1974(Jun), Vol 19(1), 1-8.—Compared the Rorschach protocols of 248 emotionally disturbed children with those of 650 normal children, using 14 scoring categories. Disturbed children exhibited normal age trends in most scores; however, their median scores in most categories were significantly different from those of normal children. Disturbed children exhibited significantly more extreme scores than normals. Differences between normal and disturbed children were greater than differences among disturbed children of varying ages. Normal and disturbed children differed significantly in all 14 scoring categories. (21 ref)—*Journal summary.*

5565. Schuckit, Marc A. et al. (U California, Medical School, San Diego) **Drug use and psychiatric problems on the campus: I. Methods and drug use at outset.** In D. F. Ricks, A. Thomas & M. Roff (Eds), *Life history research in psychopathology: III.* Minneapolis, MN: University of Minnesota Press, 1974. x, 383 p.

5566. Schwartz, Carol C.; Myers, Jerome K. & Astrachan, Boris M. (Columbia U, Coll of Physicians & Surgeons) **Psychiatric labeling and the rehabilitation of the mental patient: Implications of research findings for mental health policy.** *Archives of General Psychiatry*, 1974(Sep), Vol 31(3), 329-334.—A study of social distance reactions to mentally ill persons among 124 relatives of former mental patients found that psychiatric treatment per se was less important in determining rejection of the mentally ill than the ex-patient's level of impairment. Although 51% of family members expressed some negative attitudes toward the mentally ill, the policy of masking the psychiatric identity of treatment services is probably most appropriate when services are addressed to groups most vulnerable to the nefarious effects of psychiatric labeling, chiefly lower-class whites. Data also suggest the need for reevaluation of short-term hospital treatment of the disturbed in which the family is relied on to support the patient in the community. (35 ref)—*Journal abstract.*

5567. Schwartz, M. A.; Aikens, A. M. & Wyatt, R. J. (NIMH, Lab of Clinical Psychopharmacology, St Elizabeths Hosp, Washington, DC) **Monoamine oxidase activity in brains from schizophrenic and mentally normal individuals.** *Psychopharmacologia*, 1974, Vol 38(4), 319-328.—Previous findings indicate that chronic schizophrenics have reduced platelet monoamine oxidase (MAO) activity when compared as a group to individuals without mental disorder. In this study, an attempt was made to establish whether this difference reflects a similar difference in brain MAO activity. Postmortem brain specimens from 9 schizophrenic patients and 9 normal controls were obtained and assayed for MAO activity using a liquid scintillation technique with ("C) tryptamine as substrate. There was no significant

reduction in MAO activity in tissues from the schizophrenic group. (22 ref)—*Journal abstract*.

5568. Schwartz, Michael A.; Wyatt, Richard J.; Yang, Hsiu-Ying T. & Neff, Norton H. (NIMH, Lab of Clinical Psychopharmacology, St Elizabeths Hosp, Washington, DC) **Multiple forms of brain monoamine oxidase in schizophrenic and normal individuals.** *Archives of General Psychiatry*, 1974(Oct), Vol 31(4), 557-560.—Identified 2 forms of monoamine oxidase in 15 regions of the brain. Enzyme activity was rather uniformly distributed in the brain. There were no significant differences of enzyme activity when compared in 3 regions of the brain from mentally normal and chronic schizophrenic Ss. (17 ref)

5569. Scorza, Giorgio & Carta, Italo. (U Milano, Istituto di Clinica Psichiatria, Italy) **[The psychopathology of married couples: Psychogenic aspects revealed by the ill partner.]** (Ital) *Rivista di Psichiatria*, 1973(Nov-Dec), Vol 8(6), 599-632.—Studied 5 married couples in which the wife had neurotic symptoms. The following pathogenic dynamics were observed within the conjugal relationship: (a) narcissism motivating one or both partners in the choice of a kind of "second-self partner"; (b) unconscious choice of "substitutive partners" who were expected to satisfy frustrated infantile drives; (c) negation of pathological features by one of the partners and the projection of these traits on to the other partner, thus developing the model of a "negative partner;" (d) something resembling the model of "marital schism" with its features of contention and the dominated woman; and (e) reciprocal or one-sided idealization, masking aggressive forces due to infantile frustrations. (43 ref)—*Journal abstract*.

5570. Seligman, Roslyn; Gleser, Goldine; Rauh, Joseph & Harris, Leonard. (U Cincinnati, Coll of Medicine) **The effect of earlier parental loss in adolescence.** *Archives of General Psychiatry*, 1974(Oct), Vol 31(4), 475-479.—In a retrospective study of 85 adolescents, referred for psychiatric evaluation from the adolescent medical services of a general hospital, 36.4% had suffered an earlier parental loss. In unscreened samples of 179 Ss from schools in the area, 11.6% had suffered a similar loss; in unscreened clinic samples of 186 Ss, 16.6% had a similar loss. There were no significant differences related to sex or race. The difference between referral and contrast groups is significant ( $p < .001$ ). In all groups "father loss" occurred with about twice the frequency of "mother loss." A review of the literature revealed little about earlier parental loss in an adolescent population who came with illnesses to a medical service. The importance of a developmental dimension in studies of early parental loss is noted. (20 ref)—*Journal abstract*.

5571. Shakow, David. (NIMH, Bethesda, MD) **Some thoughts about schizophrenia research in the context of high risk studies.** *Psychiatry*, 1973(Nov), Vol 36(4), 353-365.—Reviews the history of high-risk studies of schizophrenia. It is suggested that high-risk studies are beginning to include studies of schizophrenogenic environments as well as genetic studies. (34 ref)

5572. Sharma, V. P. (BM Inst of Mental Health, Ahmedabad, India) **Identification: Its relationship with the perceiver.** *British Journal of Projective Psychology &*

*Personality Study*, 1974(Jun), Vol 19(1), 9-15.—Studied the relationship between personality and perceptual identification of human figures. U. Kragh's defense mechanism technique was applied to 13 men and 14 women in individual psychotherapy, using pictures containing a central figure (CF) and a peripheral figure (PF) of the same sex. Data concerning psychopathology, and personal and family histories were obtained from each patient's therapist. Results support 6 hypotheses: (a) Incorrect opposite sex identification of CF indicates abnormal, prolonged dependence on and attachment to the opposite-sex parent. (b) Incorrect opposite sex identification of PF indicates disturbed relations with the same-sex parent. (c) Marked variation in age and sex identification indicates lack of object constancy in familial experience. (d) Identifying CF as too young indicates avoidance of adult role. (f) Identifying CF as too old indicates preoccupation with and dependence on parents. (g) Identifying PF as too young indicates excessive preoccupation with sexual fantasy.—*Journal summary*.

5573. Sheffield, Brian F. & Pearson, Paul R. (Victoria Hosp, Blackpool, England) **Purpose-in-life in a sample of British psychiatric out-patients.** *Journal of Clinical Psychology*, 1974(Oct), Vol 30(4), 459.—Administered the Purpose-in-Life (PIL) Test to 363 male and female psychiatric outpatients, representing anxiety state, neurotic depressive, other neurotic, endogenous depressive, and personality disorders. Except for the category "other neuroses," the data indicate a general tendency for males to have higher PIL scores than females. The group with lowest PIL scores was that of females with personality disorder.—B. McLean.

5574. Shenderova, V. L. [Personality traits of parents of adolescent schizophrenics.] (Russ) *Zhurnal Nevropatologii i Psikiatrii*, 1972, Vol 72(8), 1195-1203.—Interviewed 60 parents of adolescent schizophrenics. The prevalent personality in families of Ss with malignant schizophrenia was a type of psychopathy consisting of a whole but inadequate personality with certain forms of deficiency. In families of Ss with benign schizophrenia, the parents may be considered schizoid psychopaths. The differences and similarities of the psychopathies are discussed, as well as the necessity of clinical classification through genetic analysis. (English summary) (42 ref)—J. Larsen.

5575. Shield, Paul H.; Harrow, Martin & Tucker, Gary. (U Pittsburg, Medical School) **Investigation of factors related to stimulus overinclusion.** *Psychiatric Quarterly*, 1974, Vol 48(1), 109-116.—Studied the experiential state of stimulus overinclusion (SOI) in 109 consecutively hospitalized, acutely ill psychiatric patients. The SOI phenomenon has been cited in theoretical formulations of the schizophrenic defect. However, schizophrenics did not experience significantly more SOI than other patients. Specific relationships to diagnosis, emotional states, and altered states of consciousness (particularly psychomimetics) were studied, and etiological implications are discussed.—*Journal abstract*.

5576. Shmaonova, L. M. [Epidemiological studies of some intermediate and atypical variants of paroxysmal schizophrenia.] (Russ) *Zhurnal Nevropatologii i Psikiatrii*, 1972, Vol 72(8), 1209-1217.—Studied the most

frequent types of intermediate and atypical cases of schizophrenia in a schizophrenic population in a Moscow district. 4 such types were distinguished: (a) malignant variants, including Ss with progressive paroxysmal schizophrenia, whose syndromes and rate of development were nearer to continuous malignant schizophrenia (this type constituted only 1% of the cases studied); (b) the paranoid variant (5.6% of the population), characterized by a transition in subsequent stages from a paroxysmal course to continuous development of the paranoid schizophrenic type; (c) the sluggish variant (6.7%), in which development and rate of progression were similar to continuous sluggish schizophrenia; and (d) the paroxysmal variant (9.3%), occupying an intermediate position between progressive paroxysmal and periodic schizophrenia. (English summary) (17 ref)—J. Larsen.

5577. Shneidman, Edwin S. (U California, Lab for the Study of Life-Threatening Behavior, Los Angeles) **Suicide notes reconsidered.** *Psychiatry*, 1973(Nov), Vol 36(4), 379-394.—Finds suicide notes to be dull and "poignantly pedestrian." It is suggested that a person who could write a meaningful suicide note would not be in the position of committing suicide. Different types of notes are outlined and examples given.

5578. Shows, W. Derek; Gentry, W. Doyle & Wyrick, Linda C. (Duke U, Medical Ctr) **Social constriction in psychiatric patients: A normative study.** *American Journal of Psychiatry*, 1974(Nov), Vol 131(11), 1287-1288.—Administered the Bates-Zimmerman Social Constriction Scale and the MMPI to 132 psychiatric inpatients. Neurotic patients evidenced a higher level of social constriction than did patients with psychophysiological disorders; no significant differences were found among the other diagnostic groups. Social constriction was positively related to scores on the MMPI Hypochondriasis, Depression, Psychasthenia, Schizophrenia, Social Introversion, Anxiety, Repression, and F scales; constriction was negatively related to scores on the L, K, Mania, and Ego Strength scales. It is suggested that social constriction is specifically related to behavioral traits, irrespective of diagnostic labels, and that the Bates-Zimmerman Scale should be given wider use in diagnostic consultation.—*Journal abstract*.

5579. Simonds, John F. (U Missouri) **Relationship disorders at a mental health clinic.** *Journal of Clinical Psychology*, 1974(Oct), Vol 30(4), 450-458.—Classified 114 10-13 yr old mental health center clients according to the prominence of emotional or learning symptoms. 3 clinical groups were identifiable: prominent learning symptom, prominent emotional symptom, and equally prominent learning and emotional symptom. Age, sex, WISC scores, Wide Range Achievement Test (WRAT) scores, diagnostic testing, and historical data were used to determine the appropriate categorization. It is suggested that the WISC and WRAT tests enable the educator and clinician to screen for learning disorders and help in the analysis of the effects of emotional symptoms on the learning process. An evaluation of the degree of emotional and learning disability and recognition of the interrelations between the 2 disorders is essential for effective remediation and treatment.—*Journal summary*.

5580. Sternberg, E. & Moltschanova, J. K. (Academy of Medical Sciences, Psychiatric Inst, Moscow, USSR) **[Interepisodic schizophrenias with unusually long remissions.]** (Germ) *Nervenarzt*, 1972(May), Vol 43(5), 253-257.

5581. Strange, Robert E. (US Dept of the Navy, Bureau of Medicine & Surgery, Washington, DC) **Personality disorders in the military service.** In J. R. Lion (Ed), *Personality disorders: Diagnosis and management*. Baltimore, MD: Williams & Wilkins, 1974. xi, 432 p. \$21.—Proposes reasons for the high incidence of personality disorders in the military service and describes several types of commonly occurring syndromes (e.g., emotionally unstable, passive-aggressive, and passive-dependent personalities). The type of personality disorders found in older personnel, the incidence of suicidal gestures and drug abuse, personality disorders in combat, and the role of the military psychiatrist are also examined.

5582. Sugerman, A. Arthur; Goldstein, Leonide; Marjerrison, Gordon & Stoltzfuss, Nell. (New Jersey Bureau of Research in Neurology & Psychiatry, Princeton) **Recent research in EEG amplitude analysis.** *Diseases of the Nervous System*, 1973(Apr), Vol 34(4), 162-166.—A review of recent research confirms the authors' previous hypothesis that the invariability of EEGs in schizophrenics indicates a cortical overarousal or "information input overload." Other studies indicate that field dependent schizophrenics worsen under perceptual deprivation, while field independent schizophrenics improve. Results of research with normals and schizophrenics on left-right hemisphere EEG activity in sleep and awake states are also reported. (19 ref)—A. Olson.

5583. Takagi, Ryuro. (Kyoto U, Medical School, Japan) **[Language developmental disorder as the primary disturbance of childhood autism.]** (Jpn) *Japanese Journal of Child Psychiatry*, 1972(Sep), Vol 13(5), 285-294.—Reviews recent theories of infantile autism, and endorses the hypothesis by M. Rutter, J. K. Wing, and L. Wing that language-cognitive impairment is a primary symptom and stereotype behaviors are secondary ones. To examine the hemispheric malfunctioning, the dexterity of autistic children was compared with that of retarded children. The incidence of left-handedness was about the same below age 5 but above age 6 was greater in autistic children, suggesting the possibility of minimum brain damage in the left hemisphere of older autistic children. Clinical observation of early behavior problems supported the above hypothesis. Mutism and autistic behaviors after age 3 need special attention and early treatment. (English summary) (36 ref)—S. Ohwaki.

5584. Teoh, Jinn-Inn. (U Malaya, Kuala Lumpur, Malaysia) **Psychological problems among university students in an area of rapid socio-cultural change.** *Australian & New Zealand Journal of Psychiatry*, 1974(Jun), Vol 8(2), 109-120.—Conducted a 12-mo study of all students at the University of Malaya referred with psychological problems and symptoms. Data from 308 students treated show that (a) the proportion of students from different ethnic groups agreed with that of the total student population; (b) diagnoses did not differ among students from urban as opposed to rural origins; (c) 56%

suffered from symptoms prior to university admission, and a majority of clients were seen during the 1st term of 1st- and 2nd-yr courses; (d) Chinese students had more personality and family problems and more severe acculturation-gap differences from their parents than did Malay students; and (e) 51% of the clients suffered from neuroses and 13% from schizophrenic psychosis. (33 ref) —*Journal abstract.*

5585. Timsit, M.; Dugardin, J. C.; Adam, A. & Sabatier, J. (U Liege, Belgium) [What does a diagnosis of hypochondriacal neurosis mean?] (Fren) *Acta Psychiatrica Belgica*, 1973(Jul), Vol 73(4), 458-483.—Examined 37 cases diagnosed as hypochondriacal neurosis and compared them with other cases taken from a larger statistical study. It is concluded that hypochondriacal neurosis is a distinct diagnostic category marked by emotional immaturity, repressed aggressivity, and somatic complaints concentrated on the muscular and gastrointestinal systems. (Dutch, English, German, Italian, & Spanish summaries) (23 ref)

5586. Tupin, Joe P. (U California, Medical School, Davis) **Hysterical and cyclothymic personalities.** In J. R. Lion (Ed), *Personality disorders: Diagnosis and management*. Baltimore, MD: Williams & Wilkins, 1974. xi, 432 p. \$21.—Describes characteristics, life history patterns, psychodynamics, and diagnostic criteria for hysterical and cyclothymic personalities. General information on the incidence, presenting complaints, prognosis, and complications for each disorder is also included, and various organic and psychogenic etiological models are reviewed. (33 ref)

5587. Tyrer, Peter J. & Lader, Malcolm H. (Southampton General Hosp, England) **Tremor in acute and chronic anxiety.** *Archives of General Psychiatry*, 1974(Oct), Vol 31(4), 506-509.—Measured finger tremor between 2 and 32 Hz in frequency in 2 groups of anxious Ss. In one study 32 normal Ss were made acutely anxious by experimental stressors, and their tremor was measured and compared with rest conditions. In a 2nd study, tremor was measured in 28 chronically anxious psychiatric patients and in 28 control Ss matched for age and sex. No differences were found in the peak frequency of tremor in any of the groups, but the amount of tremor was greater in the anxious Ss. The differences were greatest at tremor in the frequency range between 6 and 17 Hz. Results support the view that the differences between normal and anxious tremors are those of degree, not of nature. (17 ref)—*Journal abstract.*

5588. Uspenskaya, L. Ya. [Some characteristics of an atypical course of progressive paroxysmal schizophrenia: An epidemiological study.] (Russ) *Zhurnal Nevropatologii i Psikiatrii*, 1972, Vol 72(8), 1218-1224.—Studied the course of development of types of schizophrenia in a patient population in a Moscow district. The data indicate that the replacement of paroxysmal schizophrenia by the type which shows a continuous course may occur more often in males than in females. Analysis of paroxysmal and continuous schizophrenics revealed the prognostic validity of such factors as sex, age, manner of onset of the disease, form of the psychotic attacks, and duration of the first remission. At the continuous stage the tendency to development of the paroxysmal form appears rudimenta-

ry, which gives hope for positive results from adequate and systematic therapy. (English summary)—*J. Larsen.*

5589. von Zerssen, D.; Strian, F. & Schwarz, D. (Max-Planck-Inst für Psychiatrie, München, W Germany) **Evaluation of depressive states, especially in longitudinal studies.** In P. Pichot, R. Olivier-Martin (Eds), *Psychological measurements in psychopharmacology*. Basel, Switzerland: S. Karger, 1974. 267 p. \$35.75.

5590. Watt, Norman F. (U Massachusetts, Amherst) **Childhood and adolescent routes to schizophrenia.** In D. F. Ricks, A. Thomas & M. Roff (Eds), *Life history research in psychopathology: III*. Minneapolis, MN: University of Minnesota Press, 1974. x, 383 p.

5591. Weintraub, Walter. (U Maryland, Medical School, Inst of Psychiatry & Human Behavior, Baltimore) **Obsessive-compulsive and paranoid personalities.** In J. R. Lion (Ed), *Personality disorders: Diagnosis and management*. Baltimore, MD: Williams & Wilkins, 1974. xi, 432 p. \$21.—Discusses the rationale for considering obsessive-compulsive and paranoid personalities together, and reviews psychoanalytic theories of their etiology, characteristic defense mechanisms, response to medication, differential diagnosis, and treatments.

5592. Weiss, William U. & Edinger, Jack D. (Lafayette Coll) **Perceptual and verbal correlates of the Rorschach Prognostic Rating Scale.** *Journal of Clinical Psychology*, 1974(Oct), Vol 30(4), 574-576.—15 male process schizophrenic inpatients and 15 male college students were employed in a correlational study that involved the Rorschach Prognostic Rating Scale (RPRS) and measures of visual-spatial organizational ability and verbal ability adapted from the WAIS. Verbal ability was more significantly related to RPRS performance than was visual-spatial ability, even though the Rorschach is a perceptual organizational task. Results are interpreted in light of the ability of the RPRS to predict therapy prognosis.—*Journal summary.*

5593. Wittenborn, J. R. (Rutgers State U, Interdisciplinary Research Ctr, New Brunswick) **The WPRS: A quantification of observable psychopathology.** In P. Pichot, R. Olivier-Martin (Eds), *Psychological measurements in psychopharmacology*. Basel, Switzerland: S. Karger, 1974. 267 p. \$35.75.

5594. Wurmser, Leon. (U Maryland, Medical School, Baltimore) **Personality disorders and drug dependency.** In J. R. Lion (Ed), *Personality disorders: Diagnosis and management*. Baltimore, MD: Williams & Wilkins, 1974. xi, 432 p. \$21.—Describes a phenomenological approach to the study of personality factors in drug abuse, emphasizing the problem of compulsion, symptom equivalence, and their effects on life-style. The question of whether certain personality traits are indicative of a predisposition to drug addiction (e.g., object dependency or affect defense), the long-range effects of drugs on personality, and implications for treatment are also examined. (67 ref)

5595. Young, Rhodes C. (U California, Langley Porter Neuropsychiatric Inst, San Francisco) **Profile generalizability in the use of the MMPI with psychiatric inpatients.** *Journal of Clinical Psychology*, 1974(Oct), Vol 30(4), 552-557.—28 participating clinical psychologists matched a series of single MMPI profiles to target sets of

3 profiles produced by the same 55 inpatients tested recurrently on specified, clinically indicated occasions. The matching task was performed in terms of a priori defined statistical indices of profile similarity. Results show the statistical indices to be fully as sensitive as were the clinicians to S individuality. Using a geometric definition of profile similarity, estimates of profile generalizability were obtained by a components-of-variance analysis of the 40 profiles of the 10 male Ss and, separately, of the 180 profiles of the 45 female Ss. The stability of individual differences varied as a function of the definition of the universe of testing occasions, whether inclusive of all testing within the hospital setting or limited to a particular episode or phase of the S's disturbance.—*Journal summary.*

### Behavior Disorders

5597. Adams, Kathryn A. (U Alabama) **The child who murders: A review of theory and research.** *Criminal Justice & Behavior*, 1974(Mar), Vol 1(1), 51-61.—Reviews the literature on child murderers: their characteristics, modeling, victim precipitation, reactions to stress as causes of homicide by children, legal considerations, and prediction and prevention procedures. The variety of backgrounds from which child murderers come is emphasized, and the importance of early socialization experiences in forming behavior patterns is discussed. An early exposure to violence in childhood may lead the child to either consciously or unconsciously view violence as a means of interpersonal control. The possibility that a child is substituting for his or her parent or society in the role of murderer is examined and related to the effects of tension and frustration accumulations. Suggestions for the development of theoretical frameworks to further study this infrequent but significant problem are presented. (23 ref)—*L. Gorsey.*

5598. Alexander, Jerry. **Protecting the children of life-threatening parents.** *Journal of Clinical Child Psychology*, 1974(Sum), Vol 3(2), 53-54.—Presents some of the statistics of child abuse and comments on how professionals can help to overcome this rapidly increasing problem.

5599. Andrew, June M. (San Diego County Mental Health Services, Probation Div, CA) **Violent crime indices among community-retained delinquents.** *Criminal Justice & Behavior*, 1974(Jun), Vol 1(2), 123-130.—Evaluated the extent and degree of violent crime in a group of 172 delinquent adolescents referred for psychological evaluation in an attempt to develop program which gives the county probation department funds for sending fewer offenders to state penal institutions. It was hypothesized that male delinquents would have higher scores on a specially-developed Violence Scale than females, and that non-Anglo delinquents would score higher than Anglos. Results support the hypothesis for males and females but not for Anglos and non-Anglos. Differences were found between a group of Ss measured

in an 8-mo period in 1973 and a 2nd group measured in 1971-1973, indicating an increase in violent crimes by Caucasian females. The use of the Violence Scale for other studies of delinquency and implications of the findings for community treatment and evaluation programs and diagnostic procedures are discussed.—*L. Gorsey.*

5600. Argeriou, Milton. (Services for Traffic Safety Project, Boston, MA) **The Jellinek estimation formula revisited.** *Quarterly Journal of Studies on Alcohol*, 1974(Sep), Vol 35(3-A), 1053-1057.—Discusses the rationale of the Jellinek formula for estimating the prevalence of alcoholism. With the formula, it was estimated that there were 354,422 male and 64,663 female alcoholics alive in Massachusetts in 1970; using a variation of the method, a previous study reported estimates of 179,300 and 31,700. The limitations of the Jellinek formula are noted.

5601. Ash, Phillip. (U Illinois, Chicago Circle) **Convicted felons' attitudes toward theft.** *Criminal Justice & Behavior*, 1974(Mar), Vol 1(1), 21-29.—Administered the Reid Report Inventory (RRI), which yields measures of punitiveness (i.e., attitudes toward punishment of theft), projected attitudes toward theft, and total scores, to 187 prisoners in a state penitentiary. Data were compared with scores of 1,030 male employment applicants. Results show that convicted felons scored significantly lower than "not recommended" employment applicants on both the punitiveness and projective measures, although this discrepancy was greater for the projective than for the punitiveness measure. Convicts were significantly less punishment-oriented than employment applicants and were much more prone to have attitudes favorable to the commission of crimes. Implications for the validity of the RRI and its resistance to "faking good" are discussed.—*L. Gorsey.*

5602. Beck, Aaron T.; Resnik, Harvey L. & Lettleri, Dan J. (Eds.). (U Pennsylvania) **The prediction of suicide.** Bowie, MD: Charles Press Publishers, 1974. xii, 249 p.

5603. Beck, Aaron T.; Schuyler, Dean & Herman, Ira. (U Pennsylvania) **Development of suicidal intent scales.** In A. T. Beck, H. L. Resnik & D. J. Lettleri (Eds), *The prediction of suicide*. Bowie, MD: Charles Press Publishers, 1974. xii, 249 p.

5604. Buikhuisen, W. & Hoekstra, H. A. (U Groningen, Inst of Criminology, Netherlands) **Factors related to recidivism.** *British Journal of Criminology*, 1974(Jan), Vol 14(1), 63-69.—Compared univariate and multivariate statistical approaches to predicting recidivism in imprisoned male offenders. Ss were 451 male offenders sentenced to imprisonment between 1962 and 1964. On the basis of a 5-yr follow-up, the sample was divided into 310 recidivists and 141 nonrecidivists. Data on 22 dependent variables for each S were tabulated. Univariate analysis revealed that 10 variables discriminated between the 2 groups. The multiple correlation coefficient for these variables was .41, accounting for only 17% of the variance. Factor analysis of the 22 variables resulted in 3 factors accounting for 30% of the variance. Ss were divided into 12 groups; movers (ex-convicts who leave the neighborhood they used to live in) and nonmovers who were high or low on each of the 3

factors. The recidivism rates for each group were calculated. It is concluded that moving has a positive effect on the way ex-convicts develop, and that the magnitude of this effect depends on environmental and individual factors.—D. R. Evans.

5605. Butts, Stanley V. & Chotlos, John. (U Kansas, Medical Ctr, Kansas City) **Closed-mindedness in alcoholics.** *Quarterly Journal of Studies on Alcohol*, 1974(Sep), Vol 35(3-A), 906-910.—Administered the Rokeach Dogmatism Scale to 74 22-59 yr old male alcoholics, 34 nonalcoholic 23-46 yr old men in a vocational training class, and 29 21-58 yr old male schizophrenics. Alcoholics had significantly higher dogmatism scores than nonalcoholics ( $p < .001$ ). Although schizophrenics were significantly more dogmatic than the nonalcoholics, there was no significant difference between the alcoholics and the schizophrenics. Implications for treatment are discussed.—*Journal abstract*.

5606. Corrigan, Ellen M. (Rutgers State U, Graduate School of Social Work, New Brunswick) **Women and problem drinking: Notes on beliefs and facts.** *Addictive Diseases: An International Journal*, 1974, Vol 1(2), 215-222.—Presents a review of the literature on the magnitude of female alcoholism, life situations and the onset of problem drinking, sexual adjustment, troubles due to drinking, and treatment outcome. The lack of descriptive data on female alcoholics compared to that available for male alcoholics is stressed, and some distinct sex differences in alcoholic behaviors are noted. (37 ref)

5607. Delteil, P.; Stoesser, F. & Stoesser, R. [Ether addiction.] (Fren) *Annales Médico Psychologiques*, 1974(Mar), Vol 1(3), 329-340.—Reviews the history of ether intoxication, certain chapters of which are well known because ether was important in the development of anesthetics. Although rare, ether-dependency states continue to occur; 3 new case histories are described. Although withholding the drug does not produce marked withdrawal symptoms, psychological dependency on its use is so powerful (e.g., the user will sometimes ignore important nonintoxicating effects, such as convulsions) that it might well be classed with the physiologically addicting drugs. (40 ref)—H. E. King.

5608. Diggory, James C. (Chatham Coll) **Predicting suicide: Will-o-the-wisp or reasonable challenge?** In A. T. Beck, H. L. Resnik & D. J. Lettieri (Eds), *The prediction of suicide*. Bowie, MD: Charles Press Publishers, 1974. xii, 249 p.

5609. Ercegovic, Dragoslav; Marković, Milan & Jević-Todorović, Jasmina. (Mental Health Inst, Belgrade, Yugoslavia) [Electroencephalographic aspects of psychopathic syndrome.] (Srce) *Anali Zavoda za Mentalno Zdravlje*, 1972, Vol 4(1), 65-77.

5610. Farberow, Norman L. (VA Central Research Unit Suicide Prevention Ctr, U Southern California, Medical School) **Use of the Rorschach in predicting and understanding suicide.** *Journal of Personality Assessment*, 1974(Oct), Vol 38(5), 411-419.—Presents an overview of studies which have attempted to use the Rorschach in identifying, evaluating, and predicting the suicidal person. It is noted that results of these efforts have been almost uniformly negative due to temporal, definitive, psychodynamic, motivational, and intentional problems

in conceptualizing suicide. Studies are reviewed which concentrated on configurational, single-sign, and multiple-sign approaches to uncover significant aspects of suicidal behavior. Recommendations are discussed for making the Rorschach a more useful measure in the identification and prediction of the suicidal person. (42 ref)—B. McLean.

5611. Favazza, Armando R. & Pires, Jeannine. (U Missouri, Medical School) **The Michigan Alcoholism Screening Test: Application in a general military hospital.** *Quarterly Journal of Studies on Alcohol*, 1974(Sep), Vol 35(3-A), 925-929.—Scores on the Michigan Alcoholism Screening Test given to 183 active-duty Navy enlisted men indicated alcoholism in 97% of diagnosed alcoholics, in 31% of men hospitalized on medical wards and 33% on surgical wards, and in 22% of hospital corpsmen. Results are comparable to those of a 1973 Department of Defense study which classified 39% of enlisted men as problem drinkers.

5612. Feuerlein, Wilhelm. (Max Planck Inst für Psychiatrie, Munich, W Germany) [The alcohol withdrawal syndrome.] (Germ) *Nervenarzt*, 1972(May), Vol 43(5), 247-253.

5613. Force, Elizabeth E. & Millar, Jack W. (National Academy of Sciences—National Research Council, Div of Medical Sciences, Washington, DC) **An epidemiological and ecological study of risk factors for narcotics overdose: I. Retrospective study of psychosocial factors.** *International Journal of the Addictions*, 1974, Vol 9(3), 481-487.—Interviewed 50 14-36 yr old narcotics addicts (94% black) to test the hypotheses that there is a relationship between specific social variables (e.g., addict attitudes and behaviors) and narcotics overdose and between previous overdose experience and precautionary behavior in drug use. Results indicate that fear of withdrawal and narcotics craving are strong motivating factors for narcotics use in spite of the addicts' clear understanding of the dangers of overdose and death. Previous overdose experience did not modify drug use. Attitudinal and behavioral risk factors associated with overdose were a failure to exercise precautionary behavior, alcohol consumption together with narcotics use, and a greed for drugs. The need to teach addicts proper self-help methods for treating overdose prior to hospitalization is noted.—L. Gorsey.

5614. Freund, Kurt et al. (Clarke Inst of Psychiatry, Toronto, Ontario, Canada) **The phobic theory of male homosexuality.** *Archives of General Psychiatry*, 1974(Oct), Vol 31(4), 495-499.—Tested a particular version of the phobic theory of male homosexuality—that homosexuality is based on an aversion to heterosexual intercourse. In 20 19-48 yr old androphilic men and 16 19-28 yr old heterosexual men, penile volume changes to verbal and written descriptions of the Ss' involvement in the various phases of heterosexual interaction were measured. Prior to each exposition of a verbal representation of such a phase, Ss were prearoused by pictures of male nudes. Descriptions of involvement in the situation of locating a prospective female partner and of involvement in heterosexual pretactile interaction were responded to with penile detumescence that did not differ significantly from that to descriptions of involvement in sexually neutral situations. There was a further increase in penile

volume of the prearoused Ss on descriptions of their involvement in heterosexual tactile interaction and intercourse. Results contradict the hypothesis, whereas the Ss' verbal ratings of the various stimulus configurations on a disgust scale were in agreement with the phobic theory.—*Journal abstract.*

5615. Halikas, James A. & Rimmer, John D. (Washington U, Medical School) **Predictors of multiple drug abuse.** *Archives of General Psychiatry*, 1974(Sep), Vol 31(3), 414-418.—In a previous interview study, 100 regular marihuana users and their use of other drugs were analyzed. 48 Ss had used 1 or 2 other drugs, and 52 had used more than 2 other drugs (mean 7.5). Early antecedent and concomitant behavioral events significantly associated with polydrug use were then used to describe a possible syndrome. Childhood discipline contacts, truancy and dropout, age of first illicit drug use, first illicit drug not being marihuana, poor high school socialization, inordinate parental conflicts, poor adolescent adjustment, antisocial behavior, police contacts, homosexual experiences, and self-defeating behavior in adolescence predicted later polydrug use from among this population. The methodologic pitfalls of distinguishing antecedents from concomitants are discussed. (15 ref)—*Journal abstract.*

5616. Johnson, James H. (U Minnesota) **A cross-validation of seventeen experimental MMPI scales related to antisocial behavior.** *Journal of Clinical Psychology*, 1974(Oct), Vol 30(4), 564-565.—2 groups of applicants for psychiatric outpatient care were compared on 17 MMPI experimental scales designed to measure control, hostility, or social maladjustment. One of the groups consisted of 23 individuals known to have been arrested posttest for a felony. The other group consisted of 24 individuals who were not known to have been arrested. None of the 17 special scales distinguished between the 2 groups.—*Journal summary.*

5617. Kelly, Delos H. (State University Coll New York, Geneseo) **Track position and delinquent involvement: A preliminary analysis.** *Sociology & Social Research*, 1974(Jul), Vol 58(4), 380-386.—Hypothesized that track position, independent of social class, will be inversely related to self-report delinquent involvement. Questionnaire data from 173 male and female seniors attending 2 high schools in western New York State support the tracking hypothesis. Track position, relative to both sex and social class, was the strongest predictor of self-report delinquent involvement.—*Journal abstract.*

5618. Keuhnie, John C.; Anderson, William H. & Chandler, Emily. (McLean Hosp, Alcohol & Drug Abuse Research Ctr, Belmont, MA) **First drinking experience in addictive and nonaddictive drinkers.** *Archives of General Psychiatry*, 1974(Oct), Vol 31(4), 521-523.—Reports that 20 28-56 yr old addictive drinkers showed a substantially greater ability to report details of their 1st drinking experience than did 20 22-62 yr old matched controls interviewed under blind conditions. The hypothesis is advanced that this difference in recall may be the consequence of a difference in limbic response to challenge with alcohol and may thus provide an anatomic focus for investigation. The difference in recall may also permit the identification of a group at risk to alcoholism. (20 ref)—*Journal abstract.*

5619. Kipperman, Allan & Fine, Eric W. (U Wisconsin, Medical School, Madison) **The combined abuse of alcohol and amphetamines.** *American Journal of Psychiatry*, 1974(Nov), Vol 131(11), 1277-1280.—Interviewed 15 men (age range 19-45 yrs) who had used both alcohol and amphetamines. Clinical histories indicated the existence of 2 abuse patterns—one primarily concerned with the effects of alcohol (Type A) and the other with the effects of amphetamines (Type B). Results of a battery of psychological tests (e.g., Lanyon Psychological Screening Inventory, Taylor Manifest Anxiety scale, and the Beck Depression Inventory) show that both types of patients were moderately depressed and had significantly higher than normal anxiety levels; differences between the 2 types were also observed, including a greater anxiety level in Type B Ss. It is suggested that the management of this combination syndrome will be different from that for separate alcohol and drug abuse syndromes. (19 ref)—*Journal abstract.*

5620. Korolenko, Ts. P. & Dikovskiy, A. A. (Novosibirsk Medical Inst, USSR) [The clinical classification of alcoholism.] (Srcr) *Anali Zavoda za Mentalno Zdravlje*, 1972, Vol 4(1), 5-10.—Reviews and modifies E. M. Jellinek's classification of various forms of alcoholism. In order to maintain behavior and social consequence criteria of the classification, Jellinek's beta form—which originally covered organic disturbances—was eliminated. 4 new forms of behaviorally defined alcoholism are introduced. To account for toxic and organic aspects of alcoholism, 3 stages in ascending order of severity are suggested: cerebrastronic, encephalopathic, and partial dementia. Although any combination of the form and the stage is theoretically possible, clinical experience provides a set of likely patterns in alcoholic syndrome development.—*P. Vrtunski.*

5621. Köhler, Wolfgang. (Heiligenhafen State Hosp, W Germany) [Criteria for intellectual performance loss of chronic alcoholics on the HAWIE intelligence test.] (Germ) *Zeitschrift für Experimentelle und Angewandte Psychologie*, 1974, Vol 21(1), 103-114.—Tested 171 chronic alcoholics with the German form of the WAIS. Insufficiency was particularly marked for the performance tests: digit-symbol substitution, picture arrangement, and object assembly. 61 Ss did not show any deterioration in spite of 15 yrs of alcohol abuse. Ss over 50 were damaged most severely; their loss was probably complicated by disturbances of the involution period. (English & French summaries)—*W. J. Koppitz.*

5622. Lester, David. (Richard Stockton State Coll) **Demographic versus clinical prediction of suicidal behaviors: A look at some issues.** In A. T. Beck, H. L. Resnik & D. J. Lettieri (Eds), *The prediction of suicide*. Bowie, MD: Charles Press Publishers, 1974. xii, 249 p.

5623. Lettieri, Dan J. (National Inst for Drug Abuse, Rockville, MD) **Suicidal death prediction scales.** In A. T. Beck, H. L. Resnik & D. J. Lettieri (Eds), *The prediction of suicide*. Bowie, MD: Charles Press Publishers, 1974. xii, 249 p.

5624. Levenson, Marvin & Neuringer, Charles. (Luzerne-Wyoming County Mental Health Ctr, KS) **Suicide and field dependency.** *Omega: Journal of Death & Dying*, 1974(Sum), Vol 5(2), 181-186.—Used records regarding the Picture Completion, Block Design, and Object

Assembly subtests of the WAIS to assess field dependence in 84 male veterans who had committed suicide and in 84 nonsuicidal male psychiatric patients. The suicide group was significantly more field dependent ( $p < .05$ ) than the nonsuicide group. It is suggested that field dependent persons have a cognitive style which presents them with a highly undifferentiated and global world view which may predispose them to suicide. (24 ref) —*Journal abstract.*

5625. Levin, Mark M. & Sarri, Rosemary C. (U Michigan) **Juvenile delinquency: A study of juvenile codes in the U.S.** Ann Arbor, MI: University of Michigan, National Assessment of Juvenile Corrections, 1974. xi, 75 p.

5626. Litman, Robert E.; Wold, Carl I.; Farberow, Norman L. & Brown, Timothy R. (Suicide Prevention Ctr, Los Angeles, CA) **Prediction models of suicidal behaviors.** In A. T. Beck, H. L. Resnik & D. J. Lettieri (Eds), *The prediction of suicide*. Bowie, MD: Charles Press Publishers, 1974. xii, 249 p.

5627. Lönnqvist, J. & Achte, Kalle A. (Helsinki U, Central Hosp, Lapinlahdentie, Finland) **Witchcraft, religion and suicides in the light of *The Witch Hammer* and contemporary cases.** *Omega: Journal of Death & Dying*, 1974(Sum), Vol 5(2), 115-125.—Compares case histories of witchcraft described in *The Witch Hammer* (1487) and contemporary clinical cases. The church's attitude toward suicide is examined, with particular attention given to the defense mechanism of projection. Similarities in attitudes toward accused witches and psychiatric patients are noted.

5628. Ludwig, A. M. & Stark, L. H. (U Kentucky, Medical Ctr) **Alcohol craving: Subjective and situational aspects.** *Quarterly Journal of Studies on Alcohol*, 1974(Sep), Vol 35(3-A), 899-905.—Administered a specially-developed Drinking and Craving Questionnaire to 60 male alcoholic (mean age, 42.7) inpatients. 78% reported having experienced craving; 20% indicated that their need for alcohol was "fairly" or "very much" influenced by external cues, and 80% claimed "loss of control" after they have been drinking steadily. Craving was defined by 43% in terms of the desired effect of alcohol and by 58% in terms of a need to drink. Ss were more likely to experience craving when they were anxious, bored, worried, under stress, or in response to failure or unemployment. Craving was also perceived to vary in intensity. It is suggested that craving is a conditioned "cognitive label" which alerts alcoholics to emotional dysphoria providing them with an acceptable excuse to resume or continue drinking.—*Journal abstract.*

5629. McArdle, Judy. (Alcohol Counseling Ctr, Pensacola, FL) **Impression management by alcoholics.** *Quarterly Journal of Studies on Alcohol*, 1974(Sep), Vol 35(3-A), 911-916.—The notion that alcoholics can control the impression that others form of them was tested in 2 groups of 20-65 yr old male alcoholic inpatients: 79 patients who wanted to be transferred to the alcoholism treatment unit (Group I) and 81 patients who did not (Group II). 2 true-false tests derived from the MMPI, one measuring self-insight and the other an index of mental illness, were given to all the patients and they were told that patients high in self-insight and low

in mental illness would have a greater chance of doing well in the treatment unit. Group I Ss tried to appear more insightful by giving more true responses on the self-insight test than those in Group II; the latter did not indicate any attempt of impression management. 5630. Meade, Anthony C. (Marquette U) **The labeling approach to delinquency: State of the theory as a function of method.** *Social Forces*, 1974(Sep), Vol 53(1), 83-91.—Tested hypotheses regarding selective bias on the part of official decision-makers, and the independent effect of social control upon delinquency recidivism. Contrary to the findings of earlier studies, data from 438 (162 recidivists) juvenile offender records did not demonstrate selective bias in offender dispositions. While a significant, direct relationship was observed between official labeling (formal hearing) and recidivism the result is an example of the type of finding which too often leads to a theoretically unwarranted inferential leap beyond the interpretational limits of the study data. Suggestions for, and examples of, promising lines of methodological inquiry into central but neglected dimensions of labeling theory are presented. (38 ref)—*Journal abstract.*

5631. Mikić, Božidar. (Medical Ctr of Dubrovnik, Neuropsychiatric Div, Yugoslavia) **[Suicidal behavior and suicide attempts by old people living in a home for the aged.]** (Srce) *Anali Zavoda za Mentalno Zdravlje*, 1972, Vol 4(1), 11-17.—Studied causes, frequencies, and patterns of suicidal behavior occurring over 5 yrs in a home for the aged. Of over 400 residents of both sexes 60 yrs old or more, 41 demonstrated some form of suicidal behavior, mainly in the form of verbal communication with other residents of the home and with family. The frequency of suicidal behavior and suicide attempts increased from 3 in 1966 to 13 in 1970. Of 10 actual attempts 8 were with drugs and 2 resulted in death. Principal cause of suicidal behavior is considered to be long-term depressive disturbances. (English summary) —*P. Vrtunski.*

5632. Motto, Jerome A. (U California, Medical School, San Francisco) **Refinement of variables in assessing suicide risk.** In A. T. Beck, H. L. Resnik & D. J. Lettieri (Eds), *The prediction of suicide*. Bowie, MD: Charles Press Publishers, 1974. xii, 249 p.

5633. Murphy, George E. (Washington U, Medical School) **The clinical identification of suicidal risk.** In A. T. Beck, H. L. Resnik & D. J. Lettieri (Eds), *The prediction of suicide*. Bowie, MD: Charles Press Publishers, 1974. xii, 249 p.

5634. Nicholls, Peter; Edwards, Griffith & Kyle, Elspeth. (Inst of Psychiatry, Addiction Research Unit, London, England) **Alcoholics admitted to four hospitals in England: II. General and cause-specific mortality.** *Quarterly Journal of Studies on Alcohol*, 1974(Sep), Vol 35(3-A), 841-855.—Analyzed causes of death of 233 male and 76 female alcoholics (out of an original group of 678 men and 257 women) 10-15 yrs after their admission to 4 hospitals. The actual deaths among men were more than twice the expected rate, and more than 3 times that among women, with accidents, poisoning, violence, and suicide being the primary causes. (25 ref)

5635. Pacht, Asher R. & Cowden, James E. (Wisconsin Dept of Health & Social Services, Div of Corrections) **An exploratory study of five hundred sex offenders.** *Criminal Justice & Behavior*, 1974(Mar), Vol 1(1), 13-20.—Studied the case records of 501 sex offenders. In addition, a subgroup of 109 sex offenders were evaluated to determine the relationship of various personality characteristics to the types of offenses committed. Ss were grouped according to whether the law classified them under the criminal code (CC; i.e., when the court determined that no specialized treatment was needed) or as "sexually deviated" (SD; i.e., when the court found the offense to be a product of sexual psychopathology and recommended psychiatric treatment). Compared with CCs, SDs in general showed histories of long-term personality disturbances and significant difficulties in many areas of interpersonal functioning; they appeared to be more interested in evoking a positive response from their victims rather than gaining sexual gratification. CCs tended to be more aggressive toward their victims than SDs and were less interested in their victims' responses toward them. Suggestions for treatment of sex offenders are presented.—*L. Gorsey.*

5636. Paulson, Morris J. & Stone, Dorothy. (U California, Ctr for the Health Sciences, Div of Medical Psychology, Los Angeles) **Suicidal behavior of latency-age children.** *Journal of Clinical Child Psychology*, 1974(Sum), Vol 3(2), 50-53.—Presents an experiential encounter with 12 suicidal, preadolescent boys and girls. Neither psychosis, organic impairment, nor mental retardation were factors contributing to the suicidal condition. 50% of the parents had modeled behavior patterns and thoughts with which at least 1 of their children were identified. Chronic marital unhappiness characterized the remaining families. From the child's viewpoint the suicidal preoccupations were a cry for help and a wish to escape from intolerable personal and familial stress. Perceived rejection by parents, siblings, and/or peers was often involved. Death wishes and fears are a reality of a child's life and the professional must not ignore them despite the discomfort of discussing them with a youngster.—*A. Krichew.*

5637. Peele, Stanton & Brodsky, Archie. (Harvard U, Business School) **Interpersonal heroin: Love can be an addiction.** *Psychology Today*, 1974(Aug), Vol 8(3), 22, 24-26.—Points out parallels between drug addiction and certain nonideal forms of love. Drugs give a person a way to structure life, and the effects do not seem inherent in the drug, but develop as a result of learning. If an individual's life is not centered entirely on drugs, then withdrawal is fairly easy. Similarly, people who need another person to structure their lives and who cut themselves off from others may develop relationships which are not growth-inducing and are nearly impossible to end.—*E. J. Posavac.*

5641. Rüdiger, Dietlinde & Täschner, Helmi. (German Inst of International Pedagogical Research, Frankfurt/Main, W Germany) **[Investigations on the problem structure of juvenile drug addicts.]** (Germ) *Zeitschrift für Experimentelle und Angewandte Psychologie*, 1974, Vol 21(1), 146-161.—Matched 3 groups of 14-20 yr old high school and vocational school students ( $N = 293$ ) with respect to age, sex, and educational level and administered a questionnaire concerning personal problems to all Ss. Members of Group 1 were drug addicts under treatment, Group 2 were occasional drug users, and Group 3 had never used drugs. The responses to the questionnaire revealed significant differences between Group 1 and the other 2 groups as to the number and intensity of family problems, emotional stability, and interest in ethical, religious, and political problems. (English & French summaries)—*W. J. Koppitz.*

5642. Schuckit, Marc A. & Gunderson, E. K. (US Navy Medical Neuropsychiatric Research Unit, San Diego, CA) **Alcoholism among Navy and Marine Corps officers.** *Military Medicine*, 1974(Oct), Vol 139(10), 809-811.—Examined the characteristics of a 6% yr sample of Navy and Marine Corps officers hospitalized for alcoholism—197 Navy and 46 Marine Corps officer cases (average ages 41 and 39 yrs, respectively). There were no significant differences between Navy and Marine officers in demographic, military status, and clinical characteristics. However, Navy officers were more often returned to full duty after hospitalization than Marine officers, and were more likely to have subsequent psychiatric hospitalizations. Incidence rates by rank also exhibited differences. Suggestions for improved screening procedures and staff training are presented, and the present data are compared with similar information regarding enlisted personnel. (15 ref)—*L. Gorsey.*

5644. Srivastava, S. P. (U Lucknow, India) **Sex life in an Indian male prison.** *Indian Journal of Social Work*, 1974(Apr), Vol 35(1), 21-33.—Discusses patterns of sexual adjustment of 400 males in an all-male institution of 1,700 population. Major areas of sexual expression included nocturnal sex dreams, masturbation, and

homosexuality. Attitudes of the prisoners are described, with the problems for prison administrators, and recommendations are made.

5645. Stein, Kenneth B. & Rozyko, Vitali. (U California, Berkeley) **Psychological and social variables and personality patterns of drug abusers.** *International Journal of the Addictions*, 1974, Vol 9(3), 431-446. —Conducted interviews with and administered a battery of psychological tests (e.g., the MMPI, the Socialization scale of the California Psychological Inventory, and the Future and Past Time Perspective Tests) to 201 voluntary male admissions to the detoxification ward of a state hospital (mean age = 25.52 yrs). 6 primary personality dimensions (tension, motoric, ideational, sensory expressive, socialization, and vocabulary intelligence) were used as the basis for a computerized (OTYPE program) analysis. Data revealed 10 types which were associated with a large number of social, demographic, and psychological variables. These 10 types are described in terms of drug history and personality test results. (15 ref) —*Journal summary.*

5646. Steinglass, Peter & Wolin, Steven. (George Washington U, Medical School) **Explorations of a systems approach to alcoholism.** *Archives of General Psychiatry*, 1974(Oct), Vol 31(4), 527-532. —Describes an experimental model in which up to 6 chronic alcoholic Ss were permitted to drink in a setting that included a token economy designed to replicate the major features of an alcoholic drinking gang. Clinical observations of interactional behavior in 3 groups followed a pattern that was characterized as primitive and scarce, a depressed atmosphere, and a bored and underutilized staff, although all groups were trouble free and smoothly functioning with few examples of regressive behavior.

5647. Stenmark, David E.; Wackwitz, John H.; Pelfrey, Michael C. & Dougherty, Frank. (U South Carolina) **Substance use among juvenile offenders: Relationships to parental substance use and demographic characteristics.** *Addictive Diseases*, 1974, Vol 1(1), 43-54. —During a 12-wk period, family court counselors evaluated consecutive discharges of juvenile drug offenders (157 whites and 111 blacks) in a 14-county area of South Carolina. Demographic data and findings are presented on drug-use patterns of the offenders and their parents, and the relationships between drug use and other selected variables. Results indicate that (a) there were major race differences on almost all variables; (b) on all indicators of substance use (except mother's alcohol use), whites were heavier users than blacks; (c) there was a consistent, positive interrelationship among substance use (alcohol, marijuana, and other drugs) and between father's and mother's use of alcohol; (d) father's alcohol use was positively related to all juvenile drug-use variables; (e) mother's alcohol use was positively related to all juvenile drug-use variables only for white Ss; and (f) the relationship between demographic variables and drug use depended on both race and type of drug. —*Journal abstract.*

M. Roff (Eds), *Life history research in psychopathology: III*. Minneapolis, MN: University of Minnesota Press, 1974. x, 383 p.

5649. Ulett, George A.; Itil, Ellen & Perry, Stephen G. (Deaconess Hosp, Neuropsychiatric Service, St Louis, MO) **Cytotoxic food testing in alcoholics.** *Quarterly Journal of Studies on Alcohol*, 1974(Sep), Vol 35(3-A), 930-942. —25 male alcoholics recently hospitalized for detoxication had more positive reactions to 65 foodstuffs than did abstinent members of Alcoholics Anonymous or a group of nonalcoholics. Whether the greater sensitivity is due to a genetic mechanism or to recent excessive drinking is discussed. (31 ref)

5650. Viamontes, Jorge A. & Powell, Barbara J. (Malcolm Bliss Mental Health Ctr, St Louis, MO) **Demographic characteristics of black and white male alcoholics.** *International Journal of the Addictions*, 1974, Vol 9(3), 489-494. —Studied demographic differences and variations in the reported incidence of alcohol-related symptomatology in 100 black and 100 white male hospitalized alcoholics. Results support previous findings that blacks began drinking at an earlier age, were younger at admission, and reported more hallucinatory behavior and convulsions than whites.

5651. Wallace, Don & Hiner, Darlene. (VA Hosp, Houston, TX) **Some descriptive measures on 100 consecutive VA hospital drug abuse admissions.** *International Journal of the Addictions*, 1974, Vol 9(3), 465-473. —Reports demographic, personality, and drug history characteristics of 100 consecutive admissions to a Veterans Administration hospital drug abuse program. Data for 3 subgroups are presented, and differences in economic and criminality measures and clinical pictures are discussed.

5652. Weisman, Avery & Worden, J. W. (Harvard U, Medical School, Boston) **Risk-rescue rating in suicide assessment.** In A. T. Beck, H. L. Resnik & D. J. Lettieri (Eds), *The prediction of suicide*. Bowie, MD: Charles Press Publishers, 1974. xii, 249 p.

5653. Zanocco, Giorgio. (U Modena, Clinica delle Malattie Nervose e Mentali, Italy) **[Reflections on a theme: A revision of the concept of psychopathic personality.]** (Ital) *Rivista di Psichiatria*, 1973(Nov-Dec), Vol 8(6), 633-649. —Attempts to clarify the diagnostic parameters surrounding the concepts of "psychopathic personality." Clinical observations indicate that the psychopath lacks the ability to identify with others, i.e., to love. Consequently, he lacks the capacity for discouragement and recovery, or a genuine feeling of group membership. The psychology and psychopathology of identification and aggression explain such symptoms as unauthentic attitudes (false self), tendencies to mimic and dramatize, the dynamics of sadomasochistic relationships, and the expression of instincts and archaic codes which are the basis for retaliation, parricide, incest, cannibalism, etc. —*N. De Palma.*

5654. Zubin, Joseph. (New York State Dept of Mental Hygiene, New York) **Observations on nosological issues in the classification of suicidal behavior.** In A. T. Beck, H. L. Resnik & D. J. Lettieri (Eds), *The prediction of suicide*. Bowie, MD: Charles Press Publishers, 1974. xii, 249 p.

## Learning Disorders &amp; Mental Retardation

5655. Appell, Louise S. & McKeen, Ronald L. (Catholic U of America, Program in Special Education) **Parents and professionals rate SMR and PMR adults on developmental tasks: A comparison study.** *Mental Retardation*, 1974(Oct), Vol 12(5), 14-16.—Compared the ratings by parents and professionals of severely and profoundly retarded adults on developmental tasks as described by R. Valett (1970). Results indicate that 73 out of 110 correlations between professional and parent or guardian ratings were significant. In areas where judgment of behavioral manifestations which were emotionally tinged was required, the instrument was weakest; for areas where the tasks were clearly-stated descriptions of observable performance (e.g., language and thinking skills) and for which the raters were asked to judge the quality of the performance, there was evidence that professional and parents or guardians agreed strongly. Instances of incorrect scoring procedures are noted.—*M. E. Pounsel.*
5656. Ashcraft, Mark H. & Kellas, George. (U Kansas) **Organization in normal and retarded children: Temporal aspects of storage and retrieval.** *Journal of Experimental Psychology*, 1974(Sep), Vol 103(3), 502-508.—Studied the flow of information from input through output in a free-recall task by means of S-paced presentation times, externalized rehearsal, and interword response times. In this context, storage and retrieval of categorized material were examined for 40 10-yr-old normal and 40 16-yr-old mentally retarded children of the same mental age. As indicated by the patterns of input and output times, instructions to rehearse according to category membership led to the formation of higher order memory units that were functional during recall. Input and output times under uninstructed conditions revealed little spontaneous use of conceptual categories in either IQ group, although provision of retrieval cues resulted in a marked increase in recall performance for these Ss. Results are discussed in terms of the chunking and recoding of input and the influence of active, organized storage processing on retrieval. (16 ref)—*Journal abstract.*
5657. Baroff, George S. (U North Carolina, Chapel Hill) **Mental retardation: Nature, cause, and management.** Washington, DC: Hemisphere, 1974. xvi, 504 p. \$17.95.—This textbook includes an overview and summary of research on psychological and biological aspects of mental retardation, and examines services designed to prevent, identify, and assist retarded persons from infancy to adulthood. In-depth analyses of major educational, vocational, and residential services in 5 areas are also included. (48 p ref)
5658. Burns, Edward & Lehman, Lyle C. (State U New York, Binghamton) **An evaluation of summated rating and pair comparison measures of hyperkinesis.** *Journal of Learning Disabilities*, 1974(Oct), Vol 7(8), 504-507.—Used summated ratings and pair comparisons to assess the hyperkinesis of 20 learning-disabled children (mean age = 9.5 yrs). Results show that the ratings method was internally consistent and reliable for measuring hyperkinesis and that pair comparisons were valuable for specifying the importance of each subcategory on an individual basis.
5659. Cameron, Paul. (St Mary's Coll Maryland) **Social stereotypes: 3 faces of happiness.** *Psychology Today*, 1974(Aug), Vol 8(3), 62-64.—Answers to a self-report questionnaire indicate that the old and physically infirm did not think of themselves as less happy than the young and physically able. O ratings also showed that retarded children enjoyed life as much as normal children did. However, in all ages and physical conditions, the more well-to-do felt themselves happier than others.—*E. J. Posavac.*
5660. Carrier, Joseph K. (Parsons State Hosp Research Ctr, KS) **Nonspeech noun usage training with severely and profoundly retarded children.** *Journal of Speech & Hearing Research*, 1974(Sep), Vol 17(3), 510-517.—Used a nonspeech symbol system, consisting of small pieces of masonite cut into various shapes, to investigate the learning of noun usage by 62 nonverbal, severely or profoundly retarded 7-16 yr olds. Results indicate that most such Ss could learn appropriate skills and did so in a short period of time when this nonspeech response mode was employed.—*Journal abstract.*
5661. Clifton-Everest, I. M. (MRC, Unit for Research on Medical Applications of Psychology, U Cambridge, England) **Immediate recognition of letter sequences by slow-learning children.** *Journal of Genetic Psychology*, 1974(Sep), Vol 125(1), 13-30.—Describes 2 experiments which investigated the importance of immediate memory in explaining the defects of children with specific learning disabilities. Ss were a total of 19 such children and a group of 19 normal controls who were compared on their performance on an immediate memory task involving the recognition of letter trigrams. The variables considered were (a) rate of forgetting, (b) amount of proactive interference build-up, (c) distraction from the recognition list, (d) susceptibility to acoustic confusion, and (e) interference from the interpolated task. Results offer only equivocal evidence of a defect of immediate memory in children with specific learning disabilities and are compatible with the notion that these children are slower at developing "task sets." The findings are discussed in the context of general theories of immediate memory and theories of mental retardation.—*Journal abstract.*
5662. Cromer, Richard F. (MRC Developmental Psychology Unit, London, England) **Receptive language in the mentally retarded: Processes and diagnostic distinctions.** In R. L. Schiefelbusch & L. L. Lloyd (Eds.), *Language perspectives: Acquisition, retardation, and intervention.* Baltimore, MD: University Park Press, 1974. xv, 670 p. \$14.50.—Reviews evidence showing that some subnormals are merely delayed in their language acquisition. 2 points are stressed: that one cannot talk about linguistic competence in the mentally retarded and that greater emphasis should be placed on the processes by which language is acquired rather than on describing the linguistic level of any group. It is hypothesized that language delay may lead to different language acquisition processes after a critical period. (5 p ref)
5663. de la Cruz, Felix F. & LaVeck, Gerald D. (Eds.). (NIH, National Inst of Child Health & Human Development, Bethesda, MD) **Human sexuality and the mentally retarded.** Baltimore, MD: Penguin, 1974. xii, 352 p. \$2.95.—Presents the paperback edition of the proceed-

ings of a 1971 conference on human sexuality and the mentally retarded. 22 papers are included on the topics of psychosocial development and sex education, physical and biological aspects of sexual behavior in the retarded, institutional, and community attitudes and policies, and current and future research directions.

5664. Dettmerman, Douglas K. (Case Western Reserve U) **MR is MR is MR: Mental retardation and the philosophy of science.** *Mental Retardation*, 1974(Oct), Vol 12(5), 26-28.—Discusses 3 dimensions of defining mental retardation: (a) the type of variable—independent, dependent, or intervening—specified by the term; (b) the level of discourse—molar or molecular—implied by the definition of the term; and (c) the degree of precision suggested by the definition.

5665. Finch, A. J.; Childress, W. B. & Ollendick, T. H. (Virginia Treatment Ctr for Children, Richmond) **Efficacy of WAIS short forms.** *Mental Retardation*, 1974(Oct), Vol 12(5), 48-49.—Studied 50 WAIS protocols with Full Scale IQ equal to or less than 69 to determine the efficacy of WAIS short forms to meet the criteria proposed by R. Resnick and A. Entin (see PA, Vol 45:9973) with retarded adults. Results indicate that none of the short-form procedures employed satisfactorily fulfilled all 3 criteria for the prediction of IQ level. (16 ref)

5666. Garcia, Robert et al. (U Texas, Austin) **Perception of depth in the profoundly retarded.** *Bulletin of the Psychonomic Society*, 1974(Sep), Vol 4(3), 185-187.—18 29-54 yr old profoundly mentally retarded male Ss, having a mean social age of 1.65 and a mean social quotient of 6.63, were tested for depth perception on the "visual cliff." 39% of those tested clearly perceived this illusion of depth. The theoretical and practical implications of this experiment, and further experiments to be carried out in the future, are discussed.—*Journal abstract*.

5667. Guarnaccia, Vincent J. & Weiss, Robin L. (Hofsta U) **Factor structure of fears in the mentally retarded.** *Journal of Clinical Psychology*, 1974(Oct), Vol 30(4), 540-544.—Obtained parents' ratings on the 81-item Louisville Fear Survey for Children (LFSC) from a mailed survey for 102 6-21 yr olds who had a mean IQ of 43. Data were subjected to a principal-components factor analysis and rotated by varimax method. 4 relatively independent and psychologically meaningful factors emerged: Separation, Natural Events, Injury, and Animals. These factors correspond substantially to those obtained in studies that used the LFSC with nonretarded populations. (15 ref)—*Journal summary*.

5668. Hagen, John W.; Streeter, Lynn A. & Raker, Richard. (U Michigan) **Labeling, rehearsal, and short-term memory in retarded children.** *Journal of Experimental Child Psychology*, 1974(Oct), Vol 18(2), 259-268.—Used a short-term memory task to explore the effects of verbal labeling and rehearsal on serial-position recall in 86 mildly retarded 9-11 yr old children. A stimulus array consisting of 7 cards depicting familiar animals was presented for 7 trials. In Exp I, recall when Ss labeled the pictures as they were shown was compared to recall when no labeling occurred. Total recall was not affected, but for the older age group primacy recall was hindered and recency recall was facilitated by labeling.

In Exp II, when prompting accompanied rehearsal, recall improved at both recency and primacy positions. When prompting occurred for the primacy positions only, recall was higher for these positions but not for other positions.—*Journal abstract*.

5669. Hall, Judy E. (U Alabama, Ctr for Developmental & Learning Disorders, Birmingham) **Sexual behavior.** In J. Wortis (Ed), *Mental retardation and developmental disabilities: An annual review: VI*. New York, NY: Bruner/Mazel, 1974. xiv, 305 p.—Presents a review of the literature on sexuality and sexual behavior in the mentally retarded adolescent and adult, emphasizing research and theories in the areas of sterilization, sexual development, marriage, children, contraception, sex education, and sexual attitudes. The need for more research and more comprehensive evaluations of sex education programs for the retarded is cited. (147 ref)

5670. Hart, Joe W.; McCaffery, Leonard; Damron, Wilbur T. & Frank, Bob. (U Arkansas, Little Rock) **Research findings having implications for processes of administering sociometric techniques to the mentally retarded.** *Handbook of International Sociometry*, 1973, Vol 7, 14-28.—Discusses the sociological concepts of the need for social approval, social desirability, and sociometric status, as they relate to mentally retarded Ss. Research articles that provide clues to the effective administration of sociometric devices to this population are cited. Results of the multiprocedural observations by the staff of the North Hills Project in Arkansas are compared with research findings regarding perceptual development, motor skills, and other identifiable characteristics of the mentally retarded. Review of the literature indicates that retarded Ss may have a greater need for social approval and that little emphasis is placed on the type of in-classroom evaluation that could provide the basis for designing and developing a research-based, sociocultural curriculum for the mentally retarded. (38 ref)—R. J. Ambrosino.

5671. Hofmeister, Alan M. & Latham, Glenn. (Utah State U) **Development and validation of a mediated package for training parents of preschool mentally retarded children.** *Improving Human Performance*, 1972(Mar), Vol 1(1), 3-7.—Describes a 4-unit parent training program that emphasized teaching self-care skills to their preschool mentally retarded children. An evaluation of the program by parents suggests that the program has the potential to make significant changes in the behavior repertoires of preschool mental retardates.

5672. Horton, Kathryn B. (Vanderbilt U) **Infant intervention and language learning.** In R. L. Schiefelbusch & L. L. Lloyd (Eds), *Language perspectives: Acquisition, retardation, and intervention*. Baltimore, MD: University Park Press, 1974. xv, 670 p \$14.50.—Reviews data on language insufficiency of retarded children. It is concluded that basic research is needed on cognitive and language development in normal children before meaningful intervention strategies for retarded children can be formulated and tested. (4½ p ref)

5673. Jackson, Robin. (Aberdeen Coll of Education, Scotland) **The ecology of educable mental handicap.** *British Journal of Mental Subnormality*, 1974(Jun), Vol 20(38, Pt 1), 18-22.—Designed an ecological study including 21 socioeconomic variables to fill a perceived

gap in knowledge obtained from surveys carried out in Great Britain. Electoral wards were taken as neighborhood units and elementary linkage analysis method was applied. 4 clusters emerged from the correlation matrix, one of which was considered particularly important to the present study. A table of correlations between backwardness and social factors for 3 previous studies, compared to correlations of educable mental handicap with social factors in the present study, is presented. It is concluded that the surveys all show a high degree of consistency associating backwardness with indices of social deviancy.—R. Hall.

5674. Johnson, Clark & Jackson, Ernest G. (Hastings Coll) **Ontogenetic changes in two forms of the Muller-Lyer illusion in normal and retarded subjects.** *Developmental Psychology*, 1974(Nov), Vol 10(6), 949-953.—Forms A (arrowheads pointing out) and B (arrowheads pointing in) of the Muller-Lyer illusion were administered to normal and retarded Ss to study possible changes in illusion strength in either or both forms. It was found that only Form A changed in strength when (a) age was varied from 8-18 yrs in normal children and (b) when the illusion was presented repeatedly over 8 trials for normal and retarded children. These findings conflict with perceptual theories which assume that both forms of the illusion change with these manipulations. A control condition was also presented and its utility is discussed. (21 ref)—*Journal abstract*.

5675. Leland, Henry & Smith, Daniel E. (Ohio State U) **Mental retardation: Present and future perspectives.** Worthington, OH: Charles A. Jones, 1974. x, 230 p. \$9.95.—Presents an introduction to research, theories, methodologies, and approaches to rehabilitation in the field of mental retardation. Topics include social attitudes toward the mentally retarded; the relationships between intelligence, poverty, and retardation; defects, disabilities, and learning; the mentally retarded child and his family; and preventive programs for retardation. (19 p ref)

5676. Liese, James E. & Lerch, Harold R. (Area VI Developmental Disabilities Board, Stockton, CA) **Physical fitness and intelligence in TMRs.** *Mental Retardation*, 1974(Oct), Vol 12(5), 50-51.—Administered the AAHPER Youth Fitness Test, the Fleishman Basic Fitness Test, and the Stanford-Binet Intelligence Scale to 21 undifferentiated trainable mentally retarded males to determine the relationship between physical fitness and intelligence in trainable adolescents. Results show a significant relationship between IQ and physical fitness even though the relationship does not indicate cause. (16 ref)—M. E. Pounsel.

5677. Overbeck, Daniel B. (Arizona Training Program, Psychology/Professional Services, Coolidge) **Visual plot of adaptive behavior and FSIQ scores as an aid in client decision making.** *Rehabilitation Psychology*, 1973(Win), Vol 20(4), 187-190.—Describes the construction and use of a visual aid for displaying differences in IQ and adaptive behavior scores of retardates.

5678. Rogow, Sally M. (U British Columbia, Vancouver, Canada) **Language acquisition and the blind retarded child: A study of impaired communication.** *Education of the Visually Handicapped*, 1972(May), Vol 4(2), 36-40.—Discusses the inadequacy of educational

provisions for the blind retarded child. Ordinarily, normally developing blind children do not differ from the nonvisually handicapped child in the manner and rate of language acquisition. If a blind child hears little speech, or if his speech is not attended to, he is denied primary experiences of speech development. A 3-yr study of the emerging speech patterns of a 9-yr-old nonverbal blind girl is reported. At first she used language to refuse by shouting "No." Her speech centered around nonsense syllables. Although her language became more fluent, in storytelling she narrated only single events related to her own feelings. Her greatest distortions in language usage were in expressing her feelings. Language is communication and the basic system of human interaction, but children who live as isolates in home or in residential institutions do not experience this interaction.—C. L. Nicholson.

5679. Rowitz, Louis. (Illinois State Pediatric Inst, Chicago) **Social factors in mental retardation.** *Social Science & Medicine*, 1974(Jul), Vol 8(7), 405-412.—A review of the literature suggests that studies of social factors in mental retardation are conducted primarily within epidemiological frameworks and that the research can be classified into 4 perspectives: (a) the East Coast Prevalence Studies which have been epidemiological in nature with a concern for the incidence of retardation in a given area, (b) the social epidemiological perspective of western Europe which emphasizes program planning and evaluation, (c) social-behavioral research which is concerned with social factors in labeling and life-styles of adult retardates, and (d) the crisis research trend which is concerned with how families cope with retarded children. A synthesis of findings from these 4 frameworks is presented, based on the premise that the family should be viewed as the central core of an understanding of the social elements in mental retardation. (43 ref)—*Journal abstract*.

5680. Schiefelbusch, Richard L. (U Kansas, Bureau of Child Research) **Language.** In J. Wortis (Ed), *Mental retardation and developmental disabilities: An annual review: VI*. New York, NY: Bruner/Mazel, 1974. xiv, 305 p.—Presents a review of the history of research on language development in the retarded, problems in assessment, various language training programs, and linguistic research on inappropriate language. The usefulness of Piaget's work on concept and language development for studying the problems of the retarded is discussed, and the current emphasis on behavioral and systems planning approaches to language education is examined. (105 ref)

5681. Silverman, Wayne P. (New York State Inst for Research in Mental Retardation, New York) **Complex visual discriminations in cultural familial retardates and normal children.** *Journal of Experimental Psychology*, 1974(Sep), Vol 103(3), 539-545.—Examined information processing in a visual matching task in a group of 12 cultural familial retardates (mean age = 18 yrs) and a group of 31 normal children in Grades 2, 5, or 8, using digit sequences of varying complexity as the stimuli. Reaction times (RTs) of normal adult Ss making same judgments do not fit into a single-process self-terminating feature testing model, while those for different judgments do. This study found that (a) the same-differ-

ent relationship was the same for normal Ss and retardates, with same judgment RTs deviating from predictions of a self-terminating model; (b) overall RT was a function of Ss' mental age; and (c) differences in RTs between groups were due primarily to "intercept" rather than "slope" effects, although evidence of a possible slope difference was found between the 8th graders and the other groups.—*Journal abstract.*

5682. Talkington, Larry W. (Fairview Hosp & Training Ctr, Salem, OR) **An exploratory program for blind-retarded.** *Education of the Visually Handicapped*, 1972(May), Vol 4(2), 33-35.—Discusses the neglect of the retarded blind, including the lack of information, techniques, facilities, and resources for helping this handicapped group. An exploratory attempt to develop basic programming for a sample of retarded blind, using a stimulation-activity approach, is described. The regressive state of the Ss was indicated by their almost complete disregard for anything except unusual stimuli. Communications efforts dealt with getting Ss to respond to basic commands. The socialization approach was used to try to get students to interact with each other. Efforts were made to increase mobility skills, thereby making the student more independent. Pre- and postmeasures taken on the Verbal Language Development Scale showed improvement during the project, indicating the need for further development of program techniques.—C. L. Nicholson.

5683. Umetani, Tadao. [A study of discrimination reversal-shift learning in mentally retarded children: Investigation of reaction time.] (Japn) *Japanese Journal of Educational Psychology*, 1973(Sep), Vol 21(3), 137-147.—Studied developmental aspects of the discrimination reversal-shift learning process on the basis of analysis of reaction time and the number of trials. In Exp I, reversal shift of object-size (Task 1) and form-number (Task 2) was given to 22 13-14 yr old mentally retarded children. In Exp II, 4 successive reversal shifts of Task 2 were given to 12 mentally retarded children of the same ages. Results indicate that (a) younger Ss' preoccupation with concrete aspects of Task 1 interfered with the mediational process, (b) reaction time depended on identification of mediational cues relevant to stimulus dimensions, (c) reaction time was longer in the early stage of learning and immediately after reversal shift, and (d) fast learners have wider variability of reaction time in the early stages. (English summary) (16 ref)—S. Choe.

5684. Wagner, Rudolph F. (Richmond Public Schools, VA) **Dyssymbolia as a specific learning disability.** *International Journal of Symbolology*, 1974(Mar), Vol 5(1), 22-30.—Investigated the existence of dyssymbolia (i.e., a failure in conceptual thinking so that thoughts cannot be expressed in language) in 8 9-25 yr old Ss who had been diagnosed as dyssymbolic. Ss completed the WAIS subtests, the Kahn Test of Symbol Arrangement, the Wide Range Achievement Test, and R. F. Wagner's Reversals Test. Data suggest that dyssymbolic Ss think on more concrete levels than normals and are relatively successful in test situations requiring rote memory, but fail when concept formation task and abstract thinking are required. Deficits appear to focus on inferential rather than purely abstract thinking abilities. Suggestions

for rehabilitative exercises and implications for symbolology are discussed. (20 ref)—*Journal summary.*

5685. Wallbrown, Fred H.; Blaha, John; Counts, Dorothea H. & Wallbrown, Jane D. (Columbus Public Schools, Area of Psychological Services, OH) **The hierarchical factor structure of the WISC and revised ITPA for reading disabled children.** *Journal of Psychology*, 1974(Sep), Vol 88(1), 65-76.—Obtained a hierarchical factor solution on correlations among WISC and Illinois Test of Psycholinguistic Abilities (ITPA) subtests for 110 reading disabled 8-10 yr olds. The ability hierarchy, which included a general (g) factor, 2 subgeneral factors, and 5 primary factors, was arranged in a manner congruent with P. E. Vernon's structural paradigm. The g-factor was defined by a moderate but distinct pattern of positive loadings from WISC and ITPA subtests. At the subgeneral level a verbal-educational factor was defined by verbal WISC and ITPA subtests, and a spatial-perceptual-mechanical factor was defined by WISC performance and ITPA visual subtests. 3 primary factors—Freedom from Distractibility, Verbal Precision, and Quasi-Specific—were defined by WISC subtests. 2 primary factors—Automatic Processes and Representational Processes—were defined by ITPA subtests. (28 ref)—*Journal abstract.*

### Speech Disorders

5687. Frisch, Giora R. & Handler, Leonard. (U Windsor, Ontario, Canada) **A neuropsychological investigation of "functional disorders of speech articulation."** *Journal of Speech & Hearing Research*, 1974(Sep), Vol 17(3), 432-445.—Investigated the neurological competence of 7-8 yr old males diagnosed as having "functional articulatory disorders." The Reitan-Indiana Neuropsychological Test Battery was administered to 10 children who had errors of omission, 10 who had substitutions, and 10 who were matched controls. Results show that of the 28 subtest scores, 11 showed significant differences between those children with speech problems and controls. The scores for the omission group were significantly poorer than those for the other 2 groups. 2 judges, familiar with interpretation of the battery, rated 9 of the 10 omission Ss, 7 of the 10 substitution Ss, and 1 of the 10 control Ss as brain damaged. The Ss demonstrated greatest difficulty with tasks which required sensory-receptive functions. (19 ref)—*Journal abstract.*

5688. Ingham, Roger J.; Martin, Richard R. & Kuhl, Patricia. (New South Wales Coll of Paramedical Studies, Haymarket, Australia) **Modification and control of rate of speaking by stutterers.** *Journal of Speech & Hearing Research*, 1974(Sep), Vol 17(3), 489-496.—Assessed the frequency and percentage of words stuttered by 3 adult stutterers under conditions designed to modify and control rate of speaking. Target rates of 50% above base rate, 50% below base rate, and base rate were sought in experimental periods by on-line signaling of proximity to the target rate. A criterion of rate control was met by 2 Ss who reduced their frequency and percentage of words stuttered in the 50%-below-base rate condition. Some

reduced stuttering occurred in other conditions.  
—*Journal abstract.*

5689. Monnin, Lorraine M. & Huntington, Dorothy A. (California State U, Los Angeles) **Relationship of articulatory defects to speech-sound identification.** *Journal of Speech & Hearing Research*, 1974(Sep), Vol 17(3), 352-366.—A total of 45 normal-speaking and speech-defective children were compared on a speech-sound identification task which included sounds the speech-defective Ss misarticulated and sounds they articulated correctly. The identification task included 4 tests: [r]-[w] contrasts, acoustically similar contrasts, acoustically dissimilar contrasts, and vowel contrasts. The speech sounds were presented on a continuum from undistorted signals to severely distorted speech signals under conditions which have caused confusion among adults. The procedure employed was designed to test, in depth, each sound under study and to minimize extraneous variables. Speech-sound identification ability of speech-defective Ss was found to be specific rather than a general deficiency, suggesting a positive relationship between production and identification ability. (27 ref)—*Journal abstract.*

5690. Yoss, Kathe A. & Darley, Frederic L. (Mayo Clinic, Rochester, MN) **Developmental apraxia of speech in children with defective articulation.** *Journal of Speech & Hearing Research*, 1974(Sep), Vol 17(3), 399-416.—To identify behaviors which might distinguish developmental apraxia of speech from "functional" articulation disorders, a battery of speech and nonspeech tests was given to 30 children with moderate to severe defective articulation but with normal intelligence, hearing, and language abilities and with no apparent organic pathologic condition, and to 30 matched control Ss. Pediatric neurologic examinations were completed for the Ss with defective articulation. Highly significant differences were found between control and defective articulation Ss. A rationale was established for division of the defective articulation group on the basis of their performance on isolated volitional oral movement tasks. Combinations of variables that emerged as significant differentiating predictors between these 2 subgroups of Ss with defective articulation were neurologic ratings, 2- and 3-feature errors, distortions, prolongations and repetitions, additions, 1-place errors, and omissions. These behavioral differences support the conclusion that an identifiable developmental apraxia of speech exists in some children with defective articulation. (59 ref)—*Journal abstract.*

#### Physical & Toxic Disorders

5691. Ajax, E. T. (VA Hosp, Salt Lake City, UT) **The aphasic patient: A practical review.** *Diseases of the Nervous System*, 1973(Apr), Vol 34(4), 135-142.—Presents a practical model of language function as it relates to the normal and abnormal brain, and describes 2 salient deficits in speech and language which may occur in brain-damaged patients. It is shown that verbal language basically depends upon 2 stratified or formalized systems: acquisition of the auditory image or imprint and development of the corresponding motor package responsible for audible speech. Aphasia represents a malfunctioning of one or both of these systems.

In motor aphasia, a lesion involving the cortex of the left frontal lobe results in the production of few words, lack of fluency, stereotyped responses, and production of expletives (oaths). However, the patient retains awareness of his oral performance and exhibits ability to follow commands. In receptive aphasia, damage to the temporal parietal area of the left cerebral hemisphere results in the production of many meaningless, chaotically arranged words and word combinations. The patient is unable to understand others and appreciate his own errors. The presence of both deficits in auditory images and motor packages is termed global aphasia. Techniques for communicating with motor and receptive aphasics are discussed, and problems in the prognosis and treatment of aphasia are considered. Nonaphasic disturbances which may pose a problem in differential diagnosis are also noted. (18 ref)—A. Olson.

5692. Ames, Frances R. (Groote Schuur Hosp, Cape Town, S Africa) **Cinefilm and EEG recording during "hand-waving" attacks of an epileptic, photosensitive child.** *Electroencephalography & Clinical Neurophysiology*, 1974(Sep), Vol 37(3), 301-304.—Describes the seizures of a 5-yr-old mentally defective photosensitive epileptic boy. The seizures were complex and included repetitive hand movements. Cinefilm and EEG recordings are presented which suggest that the hand movements were part of the seizure pattern. (French summary)

5693. Amstey, Marvin S. (U Rochester, School of Medicine & Dentistry) **Herpes V. D.—A serious problem in pregnancy.** *Medical Aspects of Human Sexuality*, 1974(Aug), Vol 8(8), 128-141.—Describes basic facts about genital herpesvirus infections and its relationship to pregnancy. The virus is acquired by sexual contact and may often be a threat to newborns if the mother is infected at the time of delivery. Comparisons with syphilis and gonorrhea are discussed, and treatment recommendations are presented.

5694. Babb, Thomas L.; Mariani, Elmo & Crandall, Paul H. (U California, Los Angeles) **An electronic circuit for detection of EEG seizures recorded with implanted electrodes.** *Electroencephalography & Clinical Neurophysiology*, 1974(Sep), Vol 37(3), 305-308.—Describes an analog-digital circuit which will accept one or more EEG inputs and signal the presence of an electrographic seizure. The use of this seizure detector for routine and reliable ward monitoring of telemetered EEG is demonstrated. (French summary)

5695. Bancaud, J. et al. **"Generalized" epileptic seizures elicited by electrical stimulation of the frontal lobe in man.** *Electroencephalography & Clinical Neurophysiology*, 1974(Sep), Vol 37(3), 275-282.—Performed 509 electrical stimulations in the frontal lobes of 10 18-27 yr old epileptic patients presenting generalized spontaneous seizures. Of these 509 stimulations, 150 induced either simple electroclinical absences, complex absences, generalized tonic-clonic seizures, or bilaterally synchronous, symmetrical spike and wave seizures. These responses, which in each case paralleled the spontaneous attacks of the patient, occurred from the beginning of stimulation and ended with its cessation, except for the tonic-clonic seizures. The type of response obtained was largely related to the parameters of stimulation (i.e., in the same patient, a discharge of

subclinical spikes and waves could become an absence and subsequently a generalized tonic-clonic seizure when the intensity or duration of stimulation was increased). Results demonstrate the role of the cerebral cortex, particularly the frontal portion, in generalized epileptic attacks. (French summary) (37 ref)—*Journal summary*.

5696. Birch, Herbert G. (Albert Einstein Coll of Medicine, Yeshiva U) **Methodological issues in the longitudinal study of malnutrition.** In D. F. Ricks, A. Thomas & M. Roff (Eds), *Life history research in psychopathology: III*. Minneapolis, MN: University of Minnesota Press, 1974. x, 383 p.

5697. Black, F. William. (Fitzsimons Army Medical Ctr, Psychology Service, Denver, CO) **The cognitive sequelae of penetrating missile wounds of the brain.** *Military Medicine*, 1974(Oct), Vol 139(10), 815-817. —Administered cognitive tests to 100 patients with combat-incurred penetrating missile wounds of the brain and compared their performance with that of a control group of 50 Ss evacuated from Vietnam with no psychiatric or neurological problems. Tests included the WAIS, Wechsler Memory Scale, and the Shipley Institute of Living Scale for Measuring Intellectual Impairment. Mean performance of brain-injured Ss did not differ significantly from that of normals on any of the measures, suggesting the absence of significant impairment in the sample as a whole. Individuals within the brain-injured sample did, however, demonstrate both general and specific cognitive deficits, the incidence of deficits being higher in the left-hemisphere lesion sample and in Ss with posterior lesions than in Ss with right-hemisphere and frontal lesions.—*Journal abstract*.

5698. Black, F. William. (Fitzsimons Army Medical Ctr, Denver, CO) **Use of the MMPI with patients with recent war-related head injuries.** *Journal of Clinical Psychology*, 1974(Oct), Vol 30(4), 571-573.—Computation of a group mean MMPI profile for a sample of 50 male veterans with war-related head trauma resulted in a composite protocol with elevations above a *T* value of 70 on scales 8, 2, and 1. Because of an increased frequency of psychiatrically pathological responses on the MMPI in this sample, the clinical utility of an organic-sign index to differentiate organic from functional patients was not demonstrated. Similarly, use of a 5-item MMPI central nervous system scale as a discriminator was not supported.—*Journal summary*.

5699. Blumer, Dietrich. (McLean Hosp, Belmont, MA) **Organic personality disorders.** In J. R. Lion (Ed), *Personality disorders: Diagnosis and management*. Baltimore, MD: Williams & Wilkins, 1974. xi, 432 p. \$21. —Discusses the history of research on effects of frontal or temporal lobe lesions on personality, and describes characteristics of, and differences between, the psychopathology, diagnosis, etiology, and treatment of the frontal lobe personality and the epileptic personality. Several case examples are included. (23 ref)

5700. Bourgeois, M.; Broustet, A. & Benezech, M. [Syndrome 18 Q: A new case of partial deletion of the long arm of chromosome 18.] (Fren) *Annales Médico-Psychologiques*, 1974(May), Vol 1(5), 641-648.—Reports a single case of the verified partial deletion of the long arm of chromosome 18 in a woman 35 yrs old, with typical accompanying dysmorphic picture, mental retardation, and psychological disturbances characterized by

excitation and abnormal movements.

5701. Brekke, Beverly; Williams, John D. & Tait, Perla. (U North Dakota, Ctr for Teaching & Learning) **The acquisition of conservation of weight by visually impaired children.** *Journal of Genetic Psychology*, 1974(Sep), Vol 125(1), 89-97.—Studied 72 legally blind children 6-14 yrs of age to determine whether cognitive development of visually impaired children follows stages of development similar to sighted children; 46 blind Ss resided in institutions for the blind, and 26 lived in a family situation. All Ss were administered a modification of H. Furth's (see PA, Vol 38:7981) conservation of weight problems. Results show that there were no differences in conservation between blind Ss living at home and the sighted group. Both sighted and blind Ss living at home conserved more often than the institutionalized blind. Further investigations of the differences between the 2 groups of blind Ss showed that degree of blindness was of less importance than place of residence.—*Journal abstract*.

5702. Busse, Ewald W. (Duke U, Medical School) **Mental disorders in later life: Organic brain syndrome.** In E. W. Busse & E. Pfeiffer (Eds), *Mental illness in later life*. Washington, DC: American Psychiatric Assn, 1974. vi, 301 p. \$7.

5703. Collomb, Henri & Valantin, Simone. (Faculté de Médecine et de Pharmacie de Dakar, Sénégal) **A note on kwashiorkor as anorexia nervosa in infancy.** In E. J. Anthony & C. Koupernik (Eds), *The child in his family: Children at psychiatric risk: III*. New York, NY: John Wiley & Sons, 1974. xxi, 547 p.—Studied the psychological aspects of "kwashiorkor" (a consequence of protein deficiency occurring at the time of weaning) in 1,000 cases. Results indicate that kwashiorkor is more frequent in urban than in rural settings, is more frequent in districts undergoing recent and rapid urbanization, and most often involves the oldest sibling.

5704. Craig, Marge. **Patient: Heal thyself.** *Journal of Contemporary Psychotherapy*, 1974(Sum), Vol 6(2), 157-164.—Describes efforts of a woman with glaucoma to find a cure by any means. Attempts included a psychic healer, teachings of Eastern philosophers, biofeedback, a workshop involving color therapy, self-rhythmization exercises, and muscle relaxation. Successes in maintaining a low pressure and apparent absence of glaucoma is reported.

5705. Danaher, Ellen M. & Pickett, J. M. (Gallaudet Coll) **Notes on an artifact in measurement of the acoustic reflex.** *Journal of Speech & Hearing Research*, 1974(Sep), Vol 17(3), 505-509.—Obtained measures of the acoustic reflex on 15 college students with moderate to severe, long-term sensorineural loss. Results indicate that at high sound levels (105 db sound pressure level and above), the eliciting stimulus can cross over to the ear in which the probe is placed and can interact with the probe tone which is present continuously in that ear; this interaction between the 2 sounds can be misinterpreted as a reflex. Ways of detecting and avoiding this test artifact are discussed.

5706. Davis, Julia. (U Iowa) **Performance of young hearing-impaired children on a test of basic concepts.** *Journal of Speech & Hearing Research*, 1974(Sep), Vol

17(3), 342-351.—Administered the Boehm Test of Basic Concepts to 24 hard-of-hearing children and 24 normal-hearing children, aged 6-8 yrs. The hearing-impaired were enrolled at least part-time in regular public schools. Their responses were analyzed according to age level and degree of hearing loss and compared to norms for normal-hearing Ss. Results indicate significant differences in knowledge of the concepts tested between Ss with milder losses and those with moderately severe losses, but no significant differences between younger and older hearing-impaired Ss. Percentile rankings of raw scores revealed that 75% of the hard-of-hearing Ss scored at or below the 10th percentile when compared to norms for hearing Ss their age or younger. Item analysis of the responses indicate poorest performance on time concepts, followed by quantity, miscellaneous, and space concepts, in that order.—*Journal abstract*.

5707. Easson, William M. (Louisiana State U Medical Ctr, New Orleans) **Management of the dying child.** *Journal of Clinical Child Psychology*, 1974(Sum), Vol 3(2), 25-27.—Considers the responsibilities of the clinician when a child is dying in hospital. He must be aware of and deal with the child's family, those who are treating the child, and the child himself.

5708. Engle, Jerome. (National Hosp, London, England) **Selective photoconvulsive responses to intermittent diffuse and patterned photic stimulation.** *Electroencephalography & Clinical Neurophysiology*, 1974(Sep), Vol 37(3), 283-292.—During routine EEG recordings, over 100 epileptic and nonepileptic patients were photostimulated with both diffuse and patterned intermittent light. Stimuli consisted of a standardized tube flicker with or without a checkerboard pattern attached to the lamp face. Selective photoconvulsive EEG responses evoked by only 1 type of stimulus were observed in 12 Ss—5 responded only to pattern flicker while 7 responded to only diffuse flicker. Both stimuli evoked photoconvulsive responses in 16 other patients, but 4 clearly responded better to pattern and 2 to diffuse flicker. Of 37 Ss tested with intermittent pattern reversal, diffuse seizures were observed in only 2 Ss. Of the 28 photosensitive Ss, 13 had histories of primary generalized epilepsy, 12 had some focal characteristics, 2 had progressive myoclonus epilepsy, and 1 had no history of seizures. The possibility that selective photosensitivity indicates a specific epileptogenic mechanism is discussed. (French summary) (24 ref)—*Journal summary*.

5709. Farkas, Andrea. (Children's Hosp Medical Ctr, Boston, MA) **Research on families of terminally ill children: Problems and rewards.** *Journal of Clinical Child Psychology*, 1974(Sum), Vol 3(2), 41-43.—Describes a study of the relationship between the severity of a child's illness and the psychological functioning of the child, the mother, and siblings. Other research problems in the same area are suggested.

5710. Fedrick, Jean. (U Oxford, Unit of Clinical Epidemiology, England) **Sudden unexpected death in infants in the Oxford Record Linkage Area.** *British Journal of Preventive & Social Medicine*, 1974(Aug), Vol 28(3), 164-171.—Data from 170 cases of sudden unexpected death in infants who were matched for maternal age, parity, social class, legitimacy, and place and year of delivery with controls reveal significant associations

between unexpected deaths and short gestation, low birthweight, slight growth retardation, twin delivery, "insult" during pregnancy, induction of labor, neonatal jaundice, month of birth, congenital defects, and subsequent hospitalization. There was no relationship between death and breast feeding. (15 ref)

5711. Feifel, Herman. (VA Outpatient Clinic, Los Angeles, CA) **Religious conviction and fear of death among the healthy and the terminally ill.** *Journal for the Scientific Study of Religion*, 1974(Sep), Vol 13(3), 353-360.—Investigated the relationship between religious persuasion and fear of death in 92 physically healthy persons and 92 terminally ill patients. No differences in the intensity of fear of death were found between believers and unbelievers. Personal nearness to death also did not reveal any meaningful differences between believers and unbelievers. All Ss evidenced an acceptance-avoidance approach toward fear of death. (21 ref)—*Journal abstract*.

5712. Frits, Mogens L. & Lund, Mogens. (Glostrup Hosp, Denmark) **Stress convulsions.** *Archives of Neurology*, 1974(Sep), Vol 31(3), 155-159.—Discusses the etiology and pathogenesis of severe "stress" preceding convulsive attacks in 37 of 1,250 patients with convulsive disorders studied during a 13-yr period. Follow-up examinations were done 1-12 yrs later on 36 of these patients and on 27 of their children. Patients were 20-50 yrs old, with twice as many men as women. Families of propositi showed increased incidences of febrile convulsions. One child had paroxysmal changes on an EEG only during photostimulation. Lack of sleep was the dominating stress factor; mostly "combination stress" was involved. One patient died, 2 of 36 developed unprovoked convulsions, and 10 experienced recurrences of stress convulsions. Anticonvulsants apparently did not prevent recurrence. The EEG provided no aid in diagnostic evaluation or prognosis. (34 ref)—*Journal abstract*.

5713. Hahn, P. (Inst für Allgemeine Klinische Medizin, Heidelberg, W Germany) **[Cardiac infarction and cardiovascular neurosis.]** (Germ) *Nervenarzt*, 1972(May), Vol 43(5), 239-247.

Roff (Eds), *Life history research in psychopathology: III*. Minneapolis, MN: University of Minnesota Press, 1974. x, 383 p.

5715. Hoemann, Harry W.; Andrews, Carol E. & DeRosa, Donald V. (Bowling Green State U) **Categorical encoding in short-term memory by deaf and hearing children.** *Journal of Speech & Hearing Research*, 1974(Sep), Vol 17(3), 426-431.—Tested 37 deaf and 38 hearing children, ages 8-12, in a short-term memory task. Special interest focused on the build-up and release of proactive interference (PI). Both groups showed PI when the items were drawn from the same conceptual class of animals. In addition, experimental groups of deaf and hearing Ss showed a release from PI when shifted to a set of items drawn from a different category on the last trial. It is concluded that deaf children encode categorically in short-term memory (suggesting a normally functioning

ability to think abstractly and to process information without acoustic mediators).—*Journal abstract.*

5716. Holtzman, Neil A.; Meek, Allen G. & Mellits, E. David. (Johns Hopkins U) **Neonatal screening for phenylketonuria: Effectiveness.** *JAMA: Journal of the American Medical Association*, 1974(Aug), Vol 229(6), 667-670.—Evaluated programs for the detection of phenylketonuria (PKU) by surveys of health departments and PKU clinics. Data show that more than 10% of infants with PKU are either not being screened or are not being detected by screening, that infants with PKU who are screened on the 1st 3 days of life are more likely to be missed than those screened later, and finally that the infants in whom a diagnosis of PKU was confirmed constituted only 5.1% of all infants with presumptive positive screening tests. (U Oklahoma, Health Sciences Ctr, Children's Memorial Hosp, Oklahoma City) **Psychology and the oncology team.** *Journal of Clinical Child Psychology*, 1974(Sum), Vol 3(2), 27-29.—Discusses the contributions which can be made by a psychologist working with a team of tumor experts in the management of dying children.

5719. Hunter, W. L. & Bennett, P. B. (US Navy, Submarine Development Group One, San Diego, CA) **The causes, mechanisms and prevention of the high pressure nervous syndrome.** *Undersea Biomedical Research*, 1974(Mar), Vol 1(1), 1-28.—A review of the literature on the high pressure nervous syndrome (HPNS) suggests that the HPNS complex has the following characteristics in a variety of invertebrates and vertebrates, including man. It usually appears at depths somewhat greater than 500 fsw. Its symptoms involve primarily the central nervous system, being manifested as neuromuscular disturbances with incoordination, fasciculations, and tremors or as disturbances of higher cerebral functions with disorientation, microsleep, and in animals, convulsions. These neurological aberrations can be correlated to some degree with changes in the EEG. The development and intensity of HPNS is augmented by rapid compression to depth. This symptom complex seems to be a manifestation of some aspect of hydrostatic pressure per se, rather than the result of other more indirect effects of increased ambient pressure. 5720. Jarniou-Delort, A. [The problem of "acting out" among epileptics in a day hospital: A prospective and statistical study of the Hand-Test in the day hospital at Creteil.] (Fren) *Annales Médico Psychologiques*, 1974(Apr), Vol 1(4), 465-483.—Describes the use of the Hand Test as an index of tendencies toward sociopathic acting out among epileptic patients. The patients' reactions to 10 plates which portray the human hand in various gestures are scored for content of the responses (e.g., those indicating dependence, aggressivity, or affectivity). Results show that the acting-out index

of epileptic Ss was lower than that of a normal population. An explanation is offered in terms of the constraints imposed on action by the protective nature of the institution.—*H. E. King.*

5721. Jensema, Carl. (Gallaudet Coll, Office of Demographic Studies) **Post-rubella children in special educational programs for the hearing impaired.** *Volta Review*, 1974(Nov), Vol 76(8), 466-473.—Sampled 43,946 students enrolled in special education programs for the hearing handicapped in this country during the 1972-1973 school year. 17.6% had maternal rubella reported as a cause of their hearing loss, many of these resulting from the 1963-1965 rubella epidemic. Nearly 40% of the maternal rubella group were born during November and December; and over 75% were born September through January. The maternal rubella group tended to have more severe hearing losses, more additional handicaps, and a greater percentage enrolled in full-time special education programs.—*W. A. Hass.*

5722. Jones, Kenneth O. & Studebaker, Gerald A. (Brigham Young U) **Performance of severely hearing-impaired children on a closed-response, auditory speech discrimination test.** *Journal of Speech & Hearing Research*, 1974(Sep), Vol 17(3), 531-540.—The performance of 23 hearing-impaired children on a closed-response, auditory speech discrimination test and on an open-response, auditory speech discrimination test was compared to their performance on auditory tests of sensitivity, teacher-evaluated categories, and other related subject data. A comparison of the results of closed-response, auditory speech discrimination test and the open-response, auditory speech discrimination test indicates that the closed-response set test paradigm appeared more productive for use with severely hearing-impaired Ss whose level of performance is low (but not 0%) on the open-response, auditory speech discrimination test. The closed-response test scores for this group were highly positively correlated to data dependent upon hearing function, whereas the open-response scores were not. Analyses of the closed-response set test results indicate that a closed-response set test paradigm can successfully demonstrate auditory speech discrimination error patterns on a S group basis.—*Journal abstract.*

5723. Kay, Leslie. (U Canterbury, Christchurch, New Zealand) **Orientation for blind persons: Clear path indicator or environmental sensor.** *New Outlook for the Blind*, 1974(Sep), Vol 68(7), 289-296.—Compares aims of sensory aids that indicate the presence or absence of obstructions in the travel path with the aims of devices that provide more detailed information about various environmental characteristics. The blind person's "reading" of the environment is related to the formation of sentences from words through the use of the rules of syntax and grammar.

5724. Kubler-Ross, Elisabeth. (U Chicago) **The languages of dying.** *Journal of Clinical Child Psychology*, 1974(Sum), Vol 3(2), 22-24.—Uses several examples to illustrate the tremendous importance and the great difficulty of listening to and helping dying children and their families.

5725. Lane, Helen S. & Baker, Dorothea. (Central Inst for the Deaf, St Louis, MO) **Reading achievement of the deaf: Another look.** *Volta Review*, 1974(Nov), Vol 76(8),

489-499.—Analyzed the reading achievement records of 132 10-16 yr old former pupils of Central Institute for the Deaf, with a mean IQ of 115. The group showed continuous improvement on the American School Achievement Tests in reading (no tests of statistical significance reported). The final grade level in reading obtained by the total group was 5.8; and that attained by the 92 students who graduated from the 8th grade was 6.2. It is concluded that better reading achievement than previously reported in the literature is apparently possible for deaf children.—*W. A. Hass.*

5726. Lev-Ran, Arye. (Beilinson Hosp, Tel-Aviv, Israel) **Gender role differentiation in hermaphrodites.** *Archives of Sexual Behavior*, 1974(Sep), Vol 3(5), 391-424.—Describes 24 cases of anatomically intersexed patients with ambiguous external genitalia. All were studied in the USSR. One patient was a true hermaphrodite, 3 had mixed gonadal dysgenesis, 9 were male hermaphrodites with testes in various stages of dysgenesis, and 11 were females with congenital adrenal hyperplasia. In several cases, the appearance of the genitalia was markedly incongruent with the assigned sex (e.g., a woman with a 7-cm phallus and a boy with a 1.5-cm phallus). With 2 partial exceptions, gender identity corresponded to the sex assigned at birth. In same-aged patients with the same clinical features and almost identical appearance of the external genitalia, but assigned to different sexes, gender identity corresponded to neonatal sex assignment. These cases demonstrate that gender identity is not determined prenatally by biological influences but rather that it is postnatally learned and determined by sex assignment in infancy and the resultant socialization experiences. (26 ref)—*Journal abstract.*

5727. Lindowski, Donald C. & Dunn, Marilyn A. (George Washington U) **Self-concept and acceptance of disability.** *Rehabilitation Counseling Bulletin*, 1974(Sep), Vol 18(1), 28-32.—Examined the relationship between acceptance of disability (assessed by Linkowski's Acceptance of Disability Scale) and 2 aspects of self-concept—self-esteem (assessed by the Butler and Haigh Self-Ideal Self Q Sort) and social relationships (assessed by Dunn's Satisfaction with Social Relationships Scale). 55 undergraduates with physical disabilities were Ss, and data were obtained in 2 stages over approximately 2 yrs. Significant positive correlations were obtained between all 3 variables. It is concluded that acceptance of disability is a part of self-concept in general. The need to view values associated with disability as part of the broader perception of self is emphasized.—*Journal abstract.*

5728. Liss, Jay L.; Alpers, David & Woodruff, Robert A. (Washington U, Medical School) **The irritable colon syndrome and psychiatric illness.** *Diseases of the Nervous System*, 1973(Apr), Vol 34(4), 151-157.—25 patients with irritable colon were evaluated both medically and psychiatrically. Symptoms of the upper gastrointestinal tract were found to occur frequently in association with colon symptoms, suggesting that the syndrome is diffuse and not confined to the colon. Patients were given structured psychiatric interviews and were classified with specially designed diagnostic criteria. 23 patients (93%) were judged to be psychiatrically ill. Of these 23, 8 were

classified as having anxiety neurosis, 8 had undiagnosed psychiatric disorders, 5 had hysteria, and 2 had primary affective disorder, depressed type. Two-thirds of the psychiatrically ill patients had experienced the onset of psychiatric symptoms prior to the onset of symptoms of irritable colon. Gastrointestinal symptoms tended to conform to the course of each patient's psychiatric illness. Findings suggest that the symptoms of irritable colon are often part of diagnosable psychiatric illnesses.—*Journal summary.*

5729. Mayadas, Nazneen S. (St Louis U, School of Social Service) **Role expectations and performance of blind children: Practice and implications.** *Education of the Visually Handicapped*, 1972(May), Vol 4(2), 45-52.—Discusses the concepts of "role" and "role synchrony" in relation to blind children and their interaction with other people in professional and nonprofessional situations. Also considered are the perception of expected performance by the children themselves and their actual performance as viewed by the investigators. Interviews with adolescent blind children revealed patterns of behavior which might prove valuable in the professional treatment of blind children through the manipulation of environmental variables. Results might also be used in training parents and other adults who interact with blind children.—*C. L. Nicholson.*

Anthony & C. Koupemnik (Eds), *The child in his family: Children at psychiatric risk: III*. New York, NY: John Wiley & Sons, 1974. xxi, 547 p.—Discusses vulnerability in terms of prenatal damage to the central nervous system (CNS), perinatal damage during delivery, prematurity and intrauterine growth retardation, socioeconomic factors, the mother-child relationship, and the prevention of CNS involvement in each group.

5732. Monsen, Randall B. (Central Inst for the Deaf, St Louis, MO) **Durational aspects of vowel production in the speech of deaf children.** *Journal of Speech & Hearing Research*, 1974(Sep), Vol 17(3), 386-398.—Examined 12 deaf and 5 normal-hearing adolescents to determine the inherent durational differences between the closely related vowels, /i/ and /I/, and the modifying influence of the following consonant. While in normal speech the tense vowel /i/ is only relatively longer than the lax vowel /I/, in deaf Ss these vowels occupied much more restricted durational ranges.

5733. Novikova, L. A. **Blindness and the electrical activity of the brain: Electroencephalographic studies of the effects of sensory impairment.** (Trans B. Sznycer & L. Zielinski). New York, NY: American Foundation for the Blind, 1973. xviii, 341 p.

5734. Omolulu, Adewale. (U Ibadan, Food Science & Applied Nutrition Unit, W Nigeria) **Nutritional factors in the vulnerability of the African child.** In E. J. Anthony

& C. Koupornik (Eds). *The child in his family: Children at psychiatric risk: III*. New York, NY: John Wiley & Sons, 1974. xxi, 547 p.—Discusses vulnerability of Nigerian infants as a possible side effect of a trend toward artificial feeding. The effect of this trend on the mother-child relationship is discussed.

5735. Pastalan, Leon A. (U Michigan, Inst of Gerontology) **The simulation of age-related sensory losses: A new approach to the study of environmental barriers**. *New Outlook for the Blind*, 1974(Oct), Vol 68(8), 356-362.—Describes the development of a simulation model to duplicate aspects of environmental experiences of elderly persons with sensory deficits. Through the use of mechanical appliances to simulate the "normal" sensory losses that accompany advanced age, a number of tasks were performed in houses, a multi-purpose senior center, and a shopping center to discover and evaluate the types of environmental barriers faced by the elderly. Specific problems encountered when the visual, auditory, olfactory, and tactile senses are impaired are described. The space organized by these senses functions as both a stimulus and an orientation for the individual; compensatory aids for these senses are noted, and implications of the model for further research are discussed. (25 ref)—*Journal abstract*.

5736. Pattison, E. Mansell. (U California, Irvine) **Psychosocial predictors of death prognosis**. *Omega: Journal of Death & Dying*, 1974(Sum), Vol 5(2), 145-160.—Studied interactions between physiological, psychological, and sociological variables as factors in the short-term prognosis of death. 12 male Ss with a 50% short-term mortality risk due to clinical emphysema were evaluated and followed for 18 mo. Physiological measures included blood, gas, and ventilatory measurements; psychological measures included the Inpatient Multidimensional Psychiatric Scale and the Cornell Medical Index—Health Questionnaire; sociological measures included the Nurses' Observation Scale for Inpatient Evaluation (NOSIE-30). Only the NOSIE-30 was predictive of clinical outcome, as was the availability and use of an intact positive network of social relations. Results demonstrate the importance of having something or someone to live for. (39 ref)—*Journal abstract*.

5737. Pelson, Rodney O. & Prather, William F. (U Oregon, Medical School, Portland) **Effects of visual message-related cues, age, and hearing impairment on speechreading performance**. *Journal of Speech & Hearing Research*, 1974(Sep), Vol 17(3), 518-525.—3 groups of 12 adults each, differing primarily in age and auditory status, performed 2 speech-reading tasks. One task consisted of speech reading sentences in which the only cues provided were those from the speaker's face and lips; in the other task, a related picture was presented just prior to speech reading a given sentence. Results indicate that while message-related pictures markedly enhanced speech-reading performance for all groups, the older hearing-impaired Ss (aged 51-59 yrs) improved more than 19-26 and 52-61 yr old normal-hearing Ss regardless of age. In terms of absolute speech-reading performance, however, the younger normal-hearing Ss speech read better than either of the 2 older groups while the older adults with hearing impairment tended to

speech read better than the older Ss with normal hearing.—*Journal abstract*.

5738. Penfield, Wilder & Mathieson, Gordon. (McGill U, Montreal Neurological Inst, Quebec, Canada) **Memory: Autopsy findings and comments on the role of hippocampus in experiential recall**. *Archives of Neurology*, 1974(Sep), Vol 31(3), 145-154.—Presents detailed case reports of 2 patients who had suffered grave and unexpected loss of recent memory as a result of partial left temporal lobectomy in treatment of focal epilepsy. Autopsy findings on 1 patient indicate that he had suffered a destruction of the neurons in the right hippocampus, a long-standing ischemic lesion incurred in all probability at the time of birth. Surgical removal of the anterior portion of the left hippocampus caused instant retrograde amnesia—loss of the capacity to create "keys of access" for which the anterior half of at least 1 hippocampus is absolutely essential. The same seems to have been true of the 2nd patient. The 2 cases provide a clue to understanding the role played by the hippocampus in experiential recall and form the basis for proposing a physiological hypothesis that would explain retrograde amnesia. (19 ref)—*B. McLean*.

5739. Peronnet, F.; Michel, F.; Echallier, J. F. & Girod, J. (INSERM, Lyon, France) **Coronal topography of human auditory evoked responses**. *Electroencephalography & Clinical Neurophysiology*, 1974(Sep), Vol 37(3), 225-230.—Studied coronal topography of auditory evoked responses (AERs) in 26 normal Ss and 3 Ss with hemispheric lesions involving Heschl's gyrus. Results confirm the auditory cortical origin of the responses and demonstrate a significant interhemispheric difference which may be due to the predominance of the right hemisphere to pure tones. (French summary) (24 ref)

5740. Premack, David & Premack, Ann J. (U California, Santa Barbara) **Teaching visual language to apes and language-deficient persons**. In R. L. Schiefelbusch & L. L. Lloyd (Eds), *Language perspectives: Acquisition, retardation, and intervention*. Baltimore, MD: University Park Press, 1974. xv, 670 p \$14.50.—Reports experiments with echolalic children to determine whether perceptual responses could be classified as imitative or nonimitative. Evidence is presented to support the proposition that language acquisition is a mapping of an already existing conceptual structure.

5741. Quigley, S. P.; Smith, N. L. & Wilbur, R. B. (U Illinois, Children's Research Ctr) **Comprehension of relativized sentences by deaf students**. *Journal of Speech & Hearing Research*, 1974(Sep), Vol 17(3), 325-341.—Approximately 450 deaf students (25 males and 25 females at each age from 10 to 18 yrs) and 60 hearing students (10 males and 10 females at each age from 8 to 10 yrs) were given the 22 parts of a test of syntactic abilities. Results from the 3 tests dealing with relativization—processing, embedding, and copying—are reported. These tests required the students to make a judgment of correct or incorrect for stimulus sentences. Results show improvement with increasing age for the 10- to 18-yr-old deaf Ss. Hearing Ss, although much younger, obtained higher scores on all subtests. Results concerning specific problems in syntax reveal (a) the position and function of the relative clause affected its difficulty; (b) with medially embedded relative

clauses, Ss tended to join the nounphrase (NP) of the relative clause with the verb phrase (VP) of the main sentence thus misunderstanding the sentence; (c) when conjoining 2 sentences, Ss tended to delete coreferential subjects and objects; and (d) the possessive form NP's was accepted by deaf Ss when the possessive form *whose* was the correct form. (21 ref)—*Journal abstract*.

5742. Raskin, David E. & Frank, Sidney W. (U Washington, Harborview Medical Ctr) **Herpes encephalitis' with catatonic stupor.** *Archives of General Psychiatry*, 1974(Oct), Vol 31(4), 544-546.—Contends that psychiatrists should be alert to the possibility of patients with herpes encephalitis being admitted to psychiatric units. Difficulties in the differential diagnosis of catatonic stupor are described, and a case history is presented which demonstrates how easily catatonic stupor can be mistaken for catatonic schizophrenia.

5743. Rosenberg, Leon E. (Yale U, Medical School) **A geneticist's approach to the vulnerable child.** In E. J. Anthony & C. Koupernik (Eds), *The child in his family: Children at psychiatric risk: III*. New York, NY: John Wiley & Sons, 1974, xxi, 547 p.—Discusses the biological makeup of the vulnerable child and the role of hereditary factors in somatic diseases of children.

5744. Saunders, Frank A. (Smith-Kettlewell Inst, San Francisco, CA) **Electrocutaneous displays.** In *Conference on cutaneous communication systems and devices*. Austin, TX: Psychonomic Society, 1974, vi, 122 p.—Describes the development of electrocutaneous displays as a means of restoring sensory information to the blind and deaf. The operations of a tactile television system and a teletactor, which provide an electrotactile display of acoustic information, are described, and the underlying rationale for these displays is discussed in terms of dermal responses to electrical stimulation, the relationship of skin impedance and body locus, and the psychophysiology of single electrodes. (16 ref)

5745. Scardina, Virginia. (Cincinnati Public Schools, OH) **Identifying characteristics of children with dysfunction of the left side of the body.** *American Journal of Occupational Therapy*, 1974(Sep), Vol 28(8), 478-483.—Administered a battery of tests with variables hypothesized to reflect right-hemisphere functions to 2 groups of primary-school-age disadvantaged Ss, one group with auditory language deficits and the other with left side of the body dysfunction (LSBD). Variables other than unilateral sensorimotor factors associated with the LSBD group included deficits in comprehension, nonverbal expression of creative thinking, and spatial visualization, as well as behavior characterized by impatience, irrelevant responsiveness, and classroom disturbance. (30 ref)

5746. Schulz, Richard & Aderman, David. (Duke U) **Clinical research and the stages of dying.** *Omega: Journal of Death & Dying*, 1974(Sum), Vol 5(2), 137-143.—A review of the literature does not support E. Kübler-Ross's claim that terminal patients near death pass through 5 psychological stages in a predictable order. Data show the process of dying to be less rigid and even stageless. There is some consensus among researchers that terminal patients are depressed shortly before they die, but there is no consistent evidence that other affect dimensions characterize the dying patient.—*Journal abstract*.

5747. Shapiro, Elaine; Shapiro, Arthur K. & Clarkin, John. (Cornell U, Medical Coll, New York) **Clinical psychological testing in Tourette's syndrome.** *Journal of Personality Assessment*, 1974(Oct), Vol 38(5), 464-478.—On the basis of psychologists' ratings of the WAIS or WISC and Bender Gestalt Test and Rorschach test, 76.7% of 30 Tourette patients had signs of mild or moderate organicity. 50% had organic abnormalities on psychiatric evaluation, 58.3% on neurological evaluation, and 50% on EEG evaluation. It is concluded that patients with Gilles de la Tourette's syndrome had significantly greater organic impairment than found in a normal population. (52 ref)—*Journal abstract*.

5748. Sharma, Shridhar & Rao, Champa. (Goa Medical Coll, India) **Personality factors and adjustment patterns of peptic ulcer patients in India.** *Psychosomatics*, 1974, Vol 15(3), 139-142.—Studied 25 male Ss with peptic ulcers to provide an understanding of their personality, interpersonal relationships, conflicts, and adjustment patterns. Several projective tests and questionnaires were used. Results reveal a marked disturbance in occupational adjustment. Most Ss were ambiverts tending to extraversion with a neurotically constricted personality. Considerable anxiety was present and impaired adjustment in social and sexual spheres was noticed. Role identification and conflicts in dependence-independence needs were marked. (18 ref)—*Journal abstract*.

5749. Sigal, John J. (McGill U, Montreal, Quebec, Canada) **Enduring disturbances in behavior following acute illness in early childhood: Consistencies in four independent follow-up studies.** In E. J. Anthony & C. Koupernik (Eds), *The child in his family: Children at psychiatric risk: III*. New York, NY: John Wiley & Sons, 1974, xxi, 547 p.—Examined 3 groups of 7-12 yr olds who had been treated for nephrosis, croup, and gastroenteritis between the ages of 2 and 5 to determine the psychological effects of chronic illness in childhood. On a measure of disturbance in children's behavior, formerly ill Ss scored higher than their siblings on "conduct problems"; the croup group scored higher on "test limits," "does not curb aggression," and "inadequacy-immaturity"; the gastroenteritis group scored higher on "neurotic behavior"; and both the croup and gastroenteritis groups scored higher on "child shows excessive dependence." (15 ref)

5756. Ward, Audrey W. (U Sheffield, Medical Care Research Unit, England) **Terminal care in malignant disease.** *Social Science & Medicine*, 1974(Jul), Vol 8(7), 413-420.—Studied social and medical factors associated with dying at home vs dying in the hospital, using data from 279 English Ss who died of cancer. Differences between patients in the 2 settings were related primarily to life-style and environmental characteristics (e.g., having a chief care-giver, whether the patient lived alone, and whether the care-giver had help from friends or neighbors).

5757. Wendland, Carroll J. (U Pittsburgh, School of Health Related Professions) **Internal-external control expectancies of institutionalized physically disabled.** *Rehabilitation Psychology*, 1973(Win), Vol 20(4), 180-186.—Studied 80 males 18-35 yrs old, diagnosed as having muscular-skeletal impairment, with IQ above 90. A 2-way analysis of variance of scores on Rotter's Internal-External Control Scale indicated that the percentage of time institutionalized was not significantly related to control expectancies, whereas the chronicity of disability was so related ( $p < .07$ ). Ss disabled less than 1½ yrs had significantly higher external scores than Ss disabled for 3 yrs or more. These results suggest that there may be a tendency to expect increased direction from external forces during the critical period following disability onset. (19 ref)—*Journal abstract*.

5758. White, J. C. & Tharp, B. R. (San Jose Medical Clinic, CA) **An arousal pattern in children with organic cerebral dysfunction.** *Electroencephalography & Clinical Neurophysiology*, 1974(Sep), Vol 37(3), 265-268.—Describes an unusual EEG rhythm observed in the frontal regions during arousal from sleep in 8 2-14 yr old

children. All Ss had organic cerebral dysfunction, manifested as minimal cerebral dysfunction or as a seizure disorder. This frontal arousal rhythm is characterized by 30-150  $\mu$ V, predominantly monophasic negative waves, occurring in bursts of up to 13 sec (usually 1-6 sec) with a characteristic notching of the ascending or descending phase of each wave. It is suggested that the arousal state should be studied in all children using montages of frontal electrodes. (French summary)—*Journal summary*.

5759. Wilson, Gary B.; Ross, Mark & Calvert, Donald R. (U Connecticut) **An experimental study of the semantics of deafness.** *Volta Review*, 1974(Oct), Vol 76(7), 408-414.—Investigated individual characteristics associated with labels commonly used for hearing-impaired people (e.g., "deaf," "hard of hearing," "hearing-handicapped"). College students rated individuals described in paragraphs including each of the labels. Bipolar 7-point scales were used (21 in the 1st study, 18 in the 2nd). 2 factor analyses with varimax rotations of the resulting ratings yielded 5 factors. Rating scale means and standard deviations on each of the 5 dimensions showed considerable variation over the 11 labels investigated. The label "hearing-impaired" seemed to evoke fewer negative evaluations than the others.—Hass, W. A.

## TREATMENT AND PREVENTION

5760. Adelson, Edward R. (Banyan Inst, Lake Worth, FL) **Premature ejaculation.** *Medical Aspects of Human Sexuality*, 1974(Sep), Vol 8(9), 83-84.—Describes steps for treating the problem of premature ejaculation, including procedures for taking the history and physical examination. Emphasis is placed on the importance of harmony and communication between partners, and counseling both partners. Preliminary exercises that the couple can take in correcting the psychological difficulties that may underlie the problems are presented.

5761. Anthony, E. James & Koupernik, Cyrille (Eds.). (Washington U, Medical School) **The child in his family: Children at psychiatric risk: III.** New York, NY: John Wiley & Sons, 1974. xxi, 547 p.

5762. Borus, Jonathan F. (Walter Reed Army Inst of Research, Washington, DC) **Reentry: III. Facilitating healthy readjustment in Vietnam veterans.** *Psychiatry*, 1973(Nov), Vol 36(4), 428-439.—Compared data on returning Vietnam veterans with data from World War II veteran studies in light of both military psychiatry and civilian studies of coping with transition. Military primary prevention programs for any returning combat veterans are recommended.

5763. Branzel, Petre. [Some considerations on the significance of a tridimensional concept in the development of contemporary psychiatry.] (Fren) *Annales Médico Psychologiques*, 1974(Mar), Vol 1(3), 341-355.—Traces the steadily increasing influence of the biological, psychological, and social sciences on psychiatry in recent years, and suggests a tridimensional formulation of their effect on the practice of psychiatry. Although developed only in Rumania thus far, the model

would probably apply to the experience of any of the other developed countries as well. (28 ref)

5764. Chertok, Léon & Guillon, Florence. (Ctr de Médecine psychosomatique Dejerine, Paris, France) [Information processing in the service of research in psychiatry: A new method.] (Fren) *Annales Médico Psychologiques*, 1974(Mar), Vol 1(3), 321-328.—Describes the utility of maintaining an ongoing coded data bank of clinical information, previously gathered, with which the record of any patient can be compared. An organization of the data permitting a program of "interrogation" is described, which provides a flexible basis for comparing questions about the test case with a broad array of clinical constellations.

5765. Escalona, Sibylle K. (Albert Einstein Coll of Medicine, Rose F. Kennedy Ctr for Research in Mental Retardation & Human Development, Yeshiva U) **Intervention programs for children at psychiatric risk: The contribution of child psychiatry and developmental theory.** In E. J. Anthony & C. Kouperek (Eds), *The child in his family: Children at psychiatric risk: III*. New York, NY: John Wiley & Sons, 1974. xxi, 547 p.—Discusses the necessary elements of mental illness prevention programs for children reared in severe and chronic poverty in which the programs are adapted to the theory of personality development based on a dynamic and structural interaction model. The parameters of a definition of psychiatric risk are discussed.

5766. Fazio, Anthony F. (U Wisconsin, Milwaukee) **The use of functional analysis techniques in bladder training associated with a flaccid neurogenic bladder condition: A case study.** *Rehabilitation Psychology*, 1973(Win), Vol 20(4), 175-179.—Carried out a series of observations to discover possible exteroceptive stimuli controlling micturition in an adult male.

5767. Glaser, Edward M. & Backer, Thomas E. (Human Interaction Research Inst, Los Angeles, CA) **A look at participant-observation.** *Evaluation*, 1973, Vol 1(3), 46-49.—Discusses participant-observation as a clinical strategy for program evaluation research. 4 styles of participant-observation are described: (a) the complete participant, (b) the participant as observer, (c) the observer as participant, and (d) the complete observer. The advantages of continuous observation as a basis for providing constructive feedback to program staff are emphasized.

5768. Hunt, William A. & Bspalec, Dale A. (Loyola U, Chicago) **An evaluation of current methods of modifying smoke behavior.** *Journal of Clinical Psychology*, 1974(Oct), Vol 30(4), 431-438.—While there is a wide range of the reported results of individual investigations it does seem possible to modify smoking behavior with some success. It is argued that preselection of Ss attenuates the reported success rates. Behind this preselection of Ss lies the variable of motivation, and it is noted that only those Ss who desire to quit enter treatment and that many of these drop out before completion. The major problem may be one of enticing smokers into treatment; the problem of therapy of choice may be a minor one once the smoker is motivated to change. Results of aversive conditioning, drug therapy, education and group support, hypnosis, behavior modification, and miscellaneous combined techniques are

surveyed. It is concluded that each investigator and technique is concerned with some elements of this complex, multivariate problem, but none encompasses all of them. (91 ref)—*Journal summary*.

5769. Loreto, Galdino. (U Federal de Pernambuco, Clínica Psiquiátrica de Faculdade de Medicina, Recife, Brazil) [Symposium about the diagnosis in psychiatry.] (Port) *Neurobiologia*, 1974(Jan), Vol 37(1), 83-104.—Among the conclusions reached by the members of a symposium on psychiatric diagnosis are (a) the strategy of therapeutic action in treating a mental patient must be based on a diagnostic synthesis of all findings concerning the patient; (b) despite the variety of pathological patterns of behavior, a diagnosis based on objective knowledge about the patient is possible; (c) because psychiatric diagnosis is difficult, training of psychiatrists must include not only acquisition of skills but also personal development; (d) a psychiatric diagnosis is formulated on the physician's own synthesis of all findings and on a translation of them into categories of an accepted table of diagnosis; and (e) 3 fundamental dimensions of psychiatric diagnosis include the syndrome, the etiological-pathogenetic constellation, and the personality. (25 ref)—*English summary*.

5770. Marchais, P. [Psychiatry and epistemology: The scientific orientation in psychiatry.] (Fren) *Annales Médico-Psychologiques*, 1974(May), Vol 1(5), 565-576.—Discusses epistemological questions arising in modern science and their pertinence for clinical psychiatry. Psychiatry uses information from many sources, including sciences of different ages and levels of development; this renders it vulnerable to changes in thinking about the limits of validity of any of these sciences. The internal task for psychiatry—to integrate differing kinds of scientific information in order to understand the individual patient—is not made easier by epistemological shifts occurring outside psychiatry, in the sciences on which it is based in part.—*H. E. King*.

5771. Morrison, James R. (U California, San Diego) **Catatonia: Results of treatment.** In D. F. Ricks, A. Thomas & M. Roff (Eds), *Life history research in psychopathology: III*. Minneapolis, MN: University of Minnesota Press, 1974. x, 383 p.

5772. Penfold, Kathleen M. **Supporting mother love.** *American Journal of Nursing*, 1974(Mar), Vol 74(3), 464-467.—Discusses use of the nurse as a therapeutic intermediary in cases of separation of mother and infant. The psychological growth of a separated mother and infant is established and maintained by the nurse caring for the infant. A case history of an infant separated from his mother for repair of a congenital deformity illustrates this intermediary role of the nurse.

5773. Redick, Richard W.; Kramer, Morton & Taube, Carl A. (NIMH, Survey & Reports Section, Biometry Branch, Rockville, MD) **Epidemiology of mental illness and utilization of psychiatric facilities among older persons.** In E. W. Busse & E. Pfeiffer (Eds), *Mental illness in later life*. Washington, DC: American Psychiatric Assn, 1974. vi, 301 p. \$7.

5774. Schoenrich, Edyth H. (Maryland State Dept of Health & Mental Hygiene, Services to the Chronically Ill & Aging, Baltimore) **The potential of health education in health services delivery.** *Health Service Reports*,

1974(Jan-Feb), Vol 89(1), 3-7.—Points out the increasing need for the health education of patients and the public in 4 areas: the relationship between health and exposure to hazardous agents, personal health maintenance, consumer rights, and patient compliance with instructions.

5775. Sidel, Victor W. & Sidel, Ruth. **Serve the people: Observations on medicine in the People's Republic of China.** Boston, MA: Beacon, 1973. xiii, 317 p. \$4.45.—Based on the author's visits in 1971 and 1972, the philosophy, development, methods, and facilities of the health care system in China are described. Health care in the cities and in the country, the role of the community and the patient in health care, medical education, the treatment of mental illness, and health administration and research are examined. (8% p ref)

5776. Turton, Lawrence J. (U Michigan, Inst for the Study of Mental Retardation & Related Disabilities) **Discussion summary: Early language intervention.** In R. L. Schiefelbusch & L. L. Lloyd (Eds), *Language perspectives: Acquisition, retardation, and intervention.* Baltimore, MD: University Park Press, 1974. xv, 670 p \$14.50.—Critically reviews articles by W. A. Bricker and D. D. Bricker (see PA, Vol 53:Issue 3) and K. B. Horton (see PA, Vol 53:Issue 3) on early language learning.

### Psychotherapy & Psychotherapeutic Processes

5777. Alexander, Leo. **Treatment of impotency and anorgasmia by psychotherapy aided by hypnosis.** *American Journal of Clinical Hypnosis*, 1974(Jul), Vol 17(1), 33-43.—Neocortical thought processes, such as concern with performance in the male or concern with pleasing the partner in the female, extinguish sexual responsivity by inhibiting paleocortical and hypothalamic activity on which sexual responsiveness depends. The psychotherapy of the resulting impotency in the male and anorgasmia in the female is effective when it succeeds in isolating and freeing the pleasurable feelings of sexual activity by inhibiting the neocortical concerns and interfering with goal directed thought processes.—M. V. Kline.

5778. Allen, John P.; Denney, Duane; Kendall, John W. & Blachly, Paul H. (US Air Force School of Aerospace Medicine, Brooks Air Force Base, San Antonio, TX) **Corticotropin release during ECT in man.** *American Journal of Psychiatry*, 1974(Nov), Vol 131(11), 1225-1228.—Studied patterns of corticotropin (ACTH) secretion following single and multiple electrically induced convulsions in 7 psychiatric patients. The pattern of ACTH release during electroconvulsive therapy was similar to the pattern during other known physiological stresses. Serial seizures produced sustained high ACTH levels that fell to basal levels at the same rate as the fall after a single convulsion. (22 ref)

5779. Allison, Ralph B. **A new treatment approach for multiple personalities.** *American Journal of Clinical Hypnosis*, 1974(Jul), Vol 17(1), 15-32.—Reviews the treatments tried by many therapists during 14 yrs of treating a patient with 5 personalities. The effectiveness of treatments before and after the correct diagnosis was established are corrected.

5780. Balkin, Joseph. (John Jay Coll of Criminal Justice, City U New York) **Once more with feeling:**

**Moods before and after psychotherapy.** In D. F. Ricks, A. Thomas & M. Roff (Eds), *Life history research in psychopathology: III.* Minneapolis, MN: University of Minnesota Press, 1974. x, 383 p.

5781. Balsam, Rosemary M. & Balsam, Alan. (Yale U, Medical School) **Becoming a psychotherapist: A clinical primer.** Boston, MA: Little, Brown & Co, 1974. xviii, 319 p.—Presents an introduction to the art and techniques of psychoanalytically oriented psychotherapy. How to evaluate the patient and how to develop a therapeutic relationship are discussed, with an emphasis on the therapist's own problems and how these are handled in relation to the patient. Special situations (e.g., suicidal patients) are also examined.

5782. Beahrs, John O. & Humiston, Karl E. **Dynamics of experiential therapy.** *American Journal of Clinical Hypnosis*, 1974(Jul), Vol 17(1), 1-14.

5783. Bojanin, Svetomir & Stojanović, Ljubinka. (Mental Health Inst, Belgrade, Yugoslavia) **[The problem of transference during treatment of adolescents by Desoille's method of psychotherapy.]** (Srce) *Anali Zavoda za Mentalno Zdravlje*, 1972, Vol 4(1), 37-40.

5784. Bordin, Edward S. (U Michigan) **Research strategies in psychotherapy.** New York, NY: John Wiley & Sons, 1974. ix, 272 p. \$16.95.—Presents overviews of methodological questions in evaluation strategies, process analysis, and the use of simplifications and analogs in psychotherapy, and current research evidence of the effectiveness of psychotherapy in terms of the type of patient, the type of therapist, the choice of intervention technique, and therapist-patient interactions. (35 p ref)

5785. Brooks, Linda. (U South Carolina, Counseling Bureau) **Interactive effects of sex and status on self-disclosure.** *Journal of Counseling Psychology*, 1974(Nov), Vol 21(6), 469-474.—Rated the degree of self-disclosure of 40 male and 40 female undergraduates in interviews with either male or female interviewers of high or low status. A  $2 \times 2 \times 2$  analysis of variance revealed that (a) males disclosed more to females, while females disclosed more to males; (b) dyads containing a female resulted in more disclosure than all male dyads; (c) males revealed more to high-status interviewers, while females disclosed more to low-status interviewers; and (d) high- as opposed to low-status male interviewers elicited more disclosure from all Ss, while status of female interviewers resulted in no significant differences. The need for use of multiple measures in self-disclosure research and implications for client-therapist matching is noted.—*Journal abstract.*

5786. Burton, Arthur. (Private practice, Sacramento, CA) **Existential and humanistic theories: III. Application of theory.** In A. Burton (Ed), *Operational theories of personality.* New York, NY: Brunner/Mazel, 1974. x, 421 p. \$15.—Presents a case history to illustrate applications of some of L. Binswanger and R. D. Laing's concepts in therapy.

5787. Copeland, Adrian D. (Thomas Jefferson U, Medical School) **Textbook of adolescent psychopathology and treatment.** Springfield, IL: Charles C Thomas, 1974. viii, 141 p. \$9.75(cloth), \$6.95(paper).—Presents a textbook for practitioners and students from all fields dealing with emotionally disturbed youth. Among the

topics considered are aspects of normal adolescence, psychotherapeutic techniques for treating the problems and psychopathology of adolescence, and adaptational arrest in adolescent education and vocation.

5788. Cox, Murray. (London Hosp, England) **The psychotherapist's anxiety: Liability or asset? With special reference to the offender-patient.** *British Journal of Criminology*, 1974(Jan), Vol 14(1), 1-17.—Discusses therapist anxieties inherent in his relationship with offender-patients. The therapist must be aware of the psychodynamics within himself and his client. The relationship as it develops in 3 institutional settings, the appropriate strategy in each case, and therapist-staff interactions in each, are considered. (17 ref)

5789. Craig, Thomas J.; Huffine, Carol L. & Brooks, Marilyn. (Johns Hopkins U, Medical School) **Completion of referral to psychiatric services by inner city residents.** *Archives of General Psychiatry*, 1974(Sep), Vol 31(3), 353-357.—Analysis of the flow of 238 patients from an inner-city hospital psychiatric emergency service to 3 separate outpatient clinics disclosed the effects of structural barriers on the rate of completion of referral. Giving the patient, at the time of emergency room contact, an appointment for follow-up within 1 wk produced a threefold increase in completion over more traditional modes of referral. Variations in this general result between diagnostic groups and, to some extent, by sex and age suggest interaction between intrapersonal motivation for treatment and administrative barriers erected by treatment facilities. (32 ref)—*Journal abstract*.

5790. Danielsson, Clare. **Redemptive encounter: Its use in psychodrama, ancestral sociodrama and community building.** *Handbook of International Sociometry*, 1973, Vol 7, 71-83.—Discusses the nature of the therapeutic "encounter" and the settings where it may take place, of which the stage is the best because the stage makes the protagonist "develop responsibility as a cosmic man, not merely as a psychological or sociological being." The process of role reversal with the absent other is the process of redemption. For many people there are gaps in the past where relationships should have existed; the absent person needed for the therapeutic meeting needs to be rescued from oblivion. In psychodrama the past can be rewritten on the stage. 2 examples are described, one of familial redemption and one of ancestral redemption.—*R. J. Ambrosino*.

5791. DeLand, H. Brent. (Sangamon State U) **Reflections on auxiliary ego functioning.** *Handbook of International Sociometry*, 1973, Vol 7, 99-103.—Relates 3 personal experiences illustrating the role of the auxiliary ego in psychodrama. Comments on the function, attitude, and preparation of the auxiliary, as revealed by these experiences, are given.

5792. Ellis, Albert. (Inst for Advanced Study in Rational Psychotherapy, New York, NY) **Rational-emotive theory: Albert Ellis.** In A. Burton (Ed), *Operational theories of personality*. New York, NY: Brunner/Mazel, 1974. x, 421 p. \$15.—Describes the origins and concepts of rational-emotive therapy. It is stressed that a person's irrational beliefs and values are of critical importance in the creation of his disturbed behaviors. Teaching, training, modeling, and persuasion are considered

central to effective therapy. An illustrative case history is presented. (6 p ref)

5793. Engelhardt, H. Tristram. (U Texas, Medical Branch, Galveston) **Psychotherapy as meta-ethics.** *Psychiatry*, 1973(Nov), Vol 36(4), 440-445.—Examines values or ethics in psychotherapy and suggests that all psychotherapy, as all medicine, has a meta-ethical goal of removing hindrances to health and augmenting freedom. Health, the end goal of a curative process, is seen as personal autonomy.

5794. Felfel, Herman. (VA Outpatient Clinic, Los Angeles, CA) **Psychology and the death-awareness movement.** *Journal of Clinical Child Psychology*, 1974(Sum), Vol 3(2), 6-7.—Psychology is becoming increasingly attentive to man's efforts to deal with death, which concerns people of all ages, including young children. Psychology must continue to confront it as part of the human condition. (25 ref)

5795. Feigenbaum, Elliott M. (U California, Langley Porter Neuropsychiatric Inst, San Francisco) **Ambulatory treatment of the elderly.** In E. W. Busse & E. Pfeiffer (Eds), *Mental illness in later life*. Washington, DC: American Psychiatric Assn, 1974. vi, 301 p. \$7.

5796. Fine, Reuben. **My approach to psychotherapy.** *Journal of Contemporary Psychotherapy*, 1974(Sum), Vol 6(2), 103-107.—Presents views based on 30 yrs of experience, touching on Freud, the problem of love in treatment, the attitudes of therapists, psychoanalysis, training and the outlook for the future. The medical model is criticized, and one consolidated profession is predicted for the future.

5797. Foulkes, S. H. **My philosophy in psychotherapy.** *Journal of Contemporary Psychotherapy*, 1974(Sum), Vol 6(2), 109-114.—Discusses varied facets of psychotherapy, including psychoanalysis, transference, countertransference, group analysis, and the nature of the mind. Views are based on 40 yrs as a psychoanalyst, 25 as a training analyst.

5798. Frank, Jerome D. (Johns Hopkins U, Medical School) **Persuasion and healing: A comparative study of psychotherapy.** (Rev ed). New York, NY: Schocken, 1973. xx, 378 p. \$4.75.—Presents the revised edition of a 1960 work on the conceptual framework, procedures, and effectiveness of both psychotherapy as a whole and the various psychotherapeutic approaches. Topics include the historical roots of psychotherapy, nonmedical healing, religious revivalism and thought reform, experimental studies of persuasion, the placebo effect, individual and group therapy, and the therapeutic community. (23½ p ref)

5799. Frank, Jerome D. **My philosophy of psychotherapy.** *Journal of Contemporary Psychotherapy*, 1974(Sum), Vol 6(2), 115-120.—Presents wide-ranging ideas based on more than 40 yrs experience. Topics include understanding patient communications, features of all psychotherapies, determinants of success, and the therapeutic personality. It is suggested that, by promoting a maladaptive value system, psychotherapy may be contributing to social ills rather than alleviating them.

5800. Gardner, G. Gail. (U Colorado, Medical Ctr) **Parents: Obstacles or allies in child hypnotherapy?** *American Journal of Clinical Hypnosis*, 1974(Jul), Vol 17(1), 44-49.—Points out that the major obstacle to

successful child hypnotherapy is more often the attitude of the parents than that of the children themselves. Specific techniques are described for helping parents to accept the idea of hypnosis and to use various forms of active participation with the goal of becoming therapeutic allies.

5801. Hargreaves, William A. et al. (U California, Langley Porter Neuropsychiatric Inst, San Francisco) **Treatment acceptance following intake assignment to individual therapy, group therapy, or contact group.** *Archives of General Psychiatry*, 1974(Sep), Vol 31(3), 343-349.—Studied factors relevant to the choice of individual therapy vs 2 types of group treatment. 366 applicants were randomly assigned to individual therapy, ongoing weekly therapy groups, or a daily nonappointment contact group. The immediate acceptance of this referral was judged by whether the applicant kept his 1st treatment appointment and, if he did, by client and therapist ratings following this 1st appointment. Results suggest that the initial acceptance of treatment could be improved by not initially assigning poorly motivated applicants to group therapy. Shy and distressed clients best accepted the daily nonappointment contact groups while the more articulate and outgoing client responded best to the more traditional ongoing weekly group. Clients assigned to the "wrong" type of group therapy showed poor acceptance of the referral, while the "correctly" referred group showed initial acceptance as great as comparable clients assigned to individual therapy.—*Journal abstract*.

5802. Harman, Robert L. (U Kentucky, Counseling Ctr) **Techniques of Gestalt therapy.** *Professional Psychology*, 1974(Aug), Vol 5(3), 257-263.—States that Gestalt techniques are inappropriate for therapists who prefer to be reflective and to maintain distance. A distinction is made between Gestalt exercises (activities with specific instructions) and experiments (more free-form explorations of emotions). Specific therapeutic techniques that promote the "here and now" focus of Gestaltism are described. It is cautioned that the therapist who relies solely on specific techniques becomes a technician and that there are other tasks for the Gestalt therapist than those described.—C. Wright.

5803. Horowitz, Mardi J. (U California, Medical School, San Francisco) **Microanalysis of working through in psychotherapy.** *American Journal of Psychiatry*, 1974(Nov), Vol 131(11), 1208-1212.—Contends that selection of small segments of therapy for analysis is possible and should be encouraged because it focuses attention on low-level clinical inferences rather than on metapsychology. A method of microanalysis is presented that details the ideational structure of a conflict, views emotions as responses to incongruent ideas, describes the controlling operations motivated by these emotional responses, and indicates the sequential changes in conscious experience during a treatment episode. The microanalysis is illustrated by one episode—the composition of a poem during a session of psychoanalytically-oriented psychotherapy.—*Journal abstract*.

5804. Jachim, David P. (Family Service & Mental Health Clinic for McHenry Cty, IL) **The Social History Questionnaire as related to length of stay in psychotherapy.** *Journal of Clinical Psychology*, 1974(Oct), Vol

30(4), 446-449.—Constructed a Terminator-Remainer scale as an objective measure for identifying potential terminators and remainers prior to their entry into psychotherapy. Those items of the Social History Questionnaire (SHQ) that best differentiated between Terminator and Remainer groups were used in constructing the scale. Ss were 95 outpatients who had completed the SHQ and who were divided into 2 groups, Terminators and Remainers, according to their length of stay in therapy. Criterion groups of 23 patients each were selected and compared in terms of their responses to the SHQ. Of 393 items, 23 were found to differentiate between the 2 groups at the .05 level of significance. These 23 items then were combined into a subscale, and norms for the entire sample were established.—*Journal summary*.

5805. Jerotić, Vladeta. (Dragisa Misovic Hosp, Neuropsychiatric Div, Belgrade, Yugoslavia) [Influence of society on the formation of attitudes towards sexuality and aggressivity in the relation between psychotherapist and patient.] (Srce) *Anali Zavoda za Mentalno Zdravlje*, 1972, Vol 4(1), 49-52.

5806. Khan, Aman U.; Staerk, M. & Bonk, C. (Children's Memorial Hosp, Chicago, IL) **Hypnotic suggestibility compared with other methods of isolating emotionally-prone asthmatic children.** *American Journal of Clinical Hypnosis*, 1974(Jul), Vol 17(1), 50-53.—Carried out a study to determine the hypnotic suggestibility of a group of asthmatic children, to induce asthmatic attacks through hypnotic suggestion, and to compare hypnotic suggestibility with other methods of isolating emotionally-prone asthmatic children. Results contradict some of the earlier findings.

5807. Kosbab, F. Paul. **Imagery techniques in psychiatry.** *Archives of General Psychiatry*, 1974(Sep), Vol 31(3), 283-290.—Considers that hypnagogic or affective imagery is not an uncommon phenomenon; it is based on preconscious, preverbal "thinking in pictures" and characterized by symbol content, changing thematic scenes, motion, color perception, relative autonomy, and affective connotations. A brief historical overview on the topic is presented along with a concise procedural outline of one established clinical method (H. Leuner's), a didactic approach used by the author, and a discussion of some theoretical questions implied in these approaches. It is concluded that imagery techniques are a worthwhile addendum to the diagnostic-therapeutic armamentarium of the dynamically trained therapist for exploration and therapy of neurotic conflicts and related emotional difficulties. (41 ref)—*Journal abstract*.

5808. Lowen, Alexander. (Inst for Bioenergetic Analysis, New York, NY) **The body in personality theory: Wilhelm Reich and Alexander Lowen.** In A. Burton (Ed), *Operational theories of personality*. New York, NY: Brunner/Mazel, 1974. x, 421 p. \$15.—Discusses the unitary concept of therapy for somatic as well as psychic elements. The principles of bioenergetics and associated exercises are described, and an illustrative case history is presented.

5809. Lubrosky, Lester & Bachrach, Henry. (U Pennsylvania) **Factors influencing clinician's judgments of mental health: Eighteen experiences with the Health-Sickness Rating Scale.** *Archives of General Psychiatry*,

1974(Sep), Vol 31(3), 292-299.—A review of 18 studies using the Health-Sickness Rating Scale (HSRS), first published in 1962, supports its original promise. Reliability studies continue to show that clinicians can agree very well in judging mental health. The scale correlates with a variety of more time-consuming observer and patient scales, as well as with judgments of other similar concepts related to mental health. Several studies show that the initial level of the HSRS predicts measures of the outcome of psychotherapy. The HSRS ratings are influenced by the amount of information of the clinician, his relationship with the patient, his own experience, and his training in the use of the scale. (24 ref)—*Journal abstract*.

5810. **Lunde, Donald T.** (Stanford U, Medical School) **Eclectic and integrated theory: Gordon Allport and others.** In A. Burton (Ed), *Operational theories of personality*. New York, NY: Brunner/Mazel, 1974. x, 421 p. \$15.—Defines eclecticism and discusses the philosophical issues that it raises. Cultural, individual, and scientific factors that determine the appropriateness of a given theory for an individual are examined. Brief illustrative case histories are presented.

5811. **Ono, Osamu.** [Therapeutic camp with unsocial young children.] (Japn) *Japanese Journal of Child Psychiatry*, 1972(Sep), Vol 13(5), 323-331.—Summarized the significant findings of 5 summer camps conducted in the last 3 years. As a part of long-term therapy, 8-12 children 5-9 yrs old stayed for 3 days on a small island where their behavior during various activities was closely observed by the time-sampling method. No changes were observed during this short time in the children's relationships with each other or the staff. However, following the experience of children's separation from their family, parents reported improvement in their children's social behavior with playmates and family members, and less dependency. Meetings with parents, in preparation for the children's going to camp, developed into helpful group counseling. It is suggested that the therapeutic camp should become part of the community program for the prevention and early treatment of social and emotional problems in children. (English summary)—S. Ohwaki.

5812. **Oystragh, Philip.** **Hypnosis and frigidity.** *Journal of the American Society of Psychosomatic Dentistry & Medicine*, 1974, Vol 21(1), 10-18.—Discusses frigidity, its causes, types and treatment by hypnosis, utilizing automatic writing and abreaction.

5813. **Palazzoli, Mara S.** (Milan Ctr of Family Studies, Italy) **Self-starvation: From the intrapsychic to the transpersonal approach to anorexia nervosa.** (Trans A. Pomerans). London, England: Chaucer, 1974. x, 289 p. \$4.75.—Examines the essential characteristics of anorexia nervosa and its complex psychological dynamics. Detailed case histories are included, and a new conceptual model of the etiology and treatment of the disorder, based on general systems theory, communication, and cybernetics, is described. (37 p ref)

5814. **Pardes, Herbert; Papernik, Daniel S. & Winston, Arnold.** (State U New York, Downstate Medical Ctr, Brooklyn) **Field differentiation in inpatient psychotherapy.** *Archives of General Psychiatry*, 1974(Sep), Vol 31(3), 311-315.—Examined field differen-

tiation as a factor in the treatment of hospitalized patients. After measuring the differentiation of 60 therapists and patients with a portable rod-and-frame test, 3 categories were established: differentiated, undifferentiated, and middle. Differentiation of the therapist was significantly correlated with outcome as measured by length of stay in the hospital and likelihood of substantial clinical improvement. Further, a trend was manifested toward a correlation between therapist differentiation and likelihood of readmission. In contrast, the field differentiation of the patient seemed to have little impact on the outcome variables. The value of assigning specific therapist types to specific clinical populations where success is more likely is emphasized. (19 ref)—*Journal abstract*.

5815. **Peth, Peter R.** **Rational-emotive therapy and the older adult.** *Journal of Contemporary Psychotherapy*, 1974(Sum), Vol 6(2), 179-184.—Holds that rational-emotive therapy (RET), as originated by A. Ellis, may provide a useful orientation towards understanding and dealing with certain psychoneuroses of late life. Certain myths about late life are presented, including beliefs that consanguinal relations are all-important, respect and support of others accrues automatically in late life, old age is a disease, to be idle or inactive is to be useless and dependent, and to be old is to be asexual. The basis of irrational beliefs in societal myths also is examined. It is felt that recognition of this type of myth may augment therapeutic understanding of the older adult.—A. Farrell.

5816. **Pickford, R. W.** **Aspects of art therapy.** *British Journal of Projective Psychology & Personality Study*, 1974(Jun), Vol 19(1), 16-20.—Describes 6 ways in which art material may serve the ends of psychotherapy: (a) spontaneous self-communication through which a person may reveal to himself the nature of his problems; (b) self-expression of conflicting needs and impulses, accompanied by sublimation and re-integration; (c) spontaneous appeal to persons other than psychotherapists; (d) indirect approach to various possible psychotherapists; (e) direct approach to a psychotherapist; and (f) therapeutic influence on other persons. Several illustrative case studies are presented.—*Journal summary*.

5817. **Powell, Thomas J.** (U Michigan) **Negative expectations of treatment: Some ideas about the source and management of two types.** *Clinical Social Work Journal*, 1973(Fal), Vol 1(3), 177-186.—Discusses the sources of the client's negative expectations of treatment. These may result from the projection of superego content, or from displacement of critical superego attitudes. Both situations are illustrated by clinical case examples. If the clinician presents himself as a benevolent figure and allies himself with the client's ideals and aspirations, then negative expectations should be offset.—S. R. Stein.

5818. **Presland, John.** **Helping the maladjusted child.** *Association of Educational Psychologists' Journal & Newsletter*, 1972(Fal), Vol 3(2), 31-40.—Reviews current research on medical and psychological methods of treating maladjusted children. While a psychological approach using behavior modification principles and teaching adjustment skills is more successful than treatment based on an illness model, radical changes in

child guidance will be required, emphasizing the role of the educational psychologist. (44 ref)

5819. **Pritchard, Warren.** **Mysticism and psychotherapy.** *Journal of Contemporary Psychotherapy*, 1974(Sum), Vol 6(2), 141-145.—Proposes that the mystical is a necessary element of successful psychotherapy, which in part replaces religion and shamanism. The views of A. Huxley, W. Pahnke, C. Jung, J. Campbell, Freud and others are surveyed. It is noted that primitive tribes and great civilizations have rituals to help people prepare for death and other difficult thresholds of transformation. In modern Western culture, psychotherapy fills this role. LSD therapy in terminal illnesses is cited as an example of the mystical as part of psychotherapy.—A. Farrell.

5820. **Ricks, David F.** (City Coll, Psychological Ctr, City U New York) **Supershrink: Methods of a therapist judged successful on the basis of adult outcomes of adolescent patients.** In D. F. Ricks, A. Thomas & M. Roff (Eds), *Life history research in psychopathology: III*. Minneapolis, MN: University of Minnesota Press, 1974. x, 383 p.

5821. **Robertiello, Richard C.** **Fluctuations in ego states in "object relations" treatment.** *Journal of Contemporary Psychotherapy*, 1974(Sum), Vol 6(2), 173-175.—Reports on states of symbiotic attachment, schizoid withdrawal, and healthy separation moves in cases involving schizoid patients.

5822. **Rogers, Carl R. & Wood, John K.** (Ctr for the Study of Persons, La Jolla, CA) **Client-centered theory: Carl R. Rogers.** In A. Burton (Ed), *Operational theories of personality*. New York, NY: Brunner/Mazel, 1974. x, 421 p. \$15.—Discusses the concepts and techniques of client-centered therapy. A process continuum of changes that evolve in therapy is outlined, and illustrative case histories are presented. (31 ref)

5823. **Rosenfield, Robert L.** (Wyer Children's Hosp, Chicago, IL) **Treating delayed puberty.** *Medical Aspects of Human Sexuality*, 1974(Aug), Vol 8(8), 142-160.—Discusses diagnostic, management, and therapeutic issues involved in cases of delayed puberty. Characteristics of delayed sexual maturation in males and females are described, and the relative advantages of psychotherapy and hormonal therapy are examined. Several case examples are included, together with commentaries by physicians and pediatricians.

5824. **Rowan, Peter J.** **Psychodramatic treatment of death fantasies in adolescent girls.** *Handbook of International Sociometry*, 1973, Vol 7, 94-98.—Applied psychodrama to death fantasies in a group of 6 girls 14-15 yrs old in a child care institution. Psychodrama was chosen because classic psychotherapy procedures had met with little success and because the girls had demonstrated a tendency to express their problems in action rather than talk about them. It was expected that psychodramatizing the death fantasy would free the creativity and spontaneity conserved by the death fantasy, and allow the girls to use spontaneity and creativity on a new level. 2 types of insight were gained by the participants: those that came about when the protagonist assumed the role of the missing significant other, and those that came about through the interaction of the protagonist with the auxiliary egos. Changes in the

girls' behavior, reported by their families and the institutional staff, are attributed to a considerable extent to the psychodrama experience.—R. J. Ambrosino.

5825. **Sandron, Leo.** (Metropolitan State Hosp, Norwalk, CA) **Psychodrama with hostile group members.** *Handbook of International Sociometry*, 1973, Vol 7, 29-36.—Describes the use of psychodrama in dealing constructively with hostility in groups. 4 case illustrations are presented in which hostility by a member or members of the group was encountered. Examples of overt, covert, verbal, and nonverbal hostility are discussed. It is important for the group director to establish a positive atmosphere during the early warm-up phase of each psychodrama by sharing himself and his own experiences. The role of the group director is summarized as that of an agent who demonstrates spontaneity, a sense of sharing, and humor.—R. J. Ambrosino.

5826. **Sauber, S. Richard.** **Approaches to pretherapy training.** *Journal of Contemporary Psychotherapy*, 1974(Sum), Vol 6(2), 190-197.—Studied uses of pretherapy training to enhance successful therapy, stressing the therapeutic variables of attraction, openness, and readiness. 36 female patients who voluntarily sought help at a marriage counseling clinic were assigned to one of 4 experimental conditions: role induction training, vicarious pretherapy training, therapeutic reading, or control. Ss were university students seeking marital help for the 1st time. Role induction training was found to be the most effective, followed by vicarious pretherapy training. It is concluded that role induction training should be planned as a routine activity prior to the patient's 1st session with his therapist. (24 ref)—A. Farrell.

5827. **Saul, Sidney R. & Saul, Shura.** (Kingsbridge Heights Nursing Home, Bronx, NY) **Group psychotherapy in a proprietary nursing home.** *Gerontologist*, 1974(Oct), Vol 14(5, Pt 1), 446-450.—Reports that a unique aspect of group and individual psychotherapy with elderly residents in a 200-bed proprietary nursing home was the involvement of the interdisciplinary team and the utilization of the therapy group as a tool to improve the total milieu of the setting. Parts of this process are discussed, including criteria for the selection of participants, the group process, differential uses of group therapy within different parts of the system, training of cotherapists, involvement of paraprofessionals and families, follow-through on treatment by other components of the system, and ongoing evaluation and change.—*Journal abstract*.

5828. **Savodnik, Irwin.** (Massachusetts General Hosp, Boston) **Understanding persons as persons.** *Psychiatric Quarterly*, 1974, Vol 48(1), 93-108.—Posits that American psychiatry has tended to divide into 2 camps—one seeking to understand persons as bodies and the other seeking to understand them in terms of a mechanistic mental life. It is argued that both these approaches, while rewarding in certain respects, fail in the quest of understanding persons as persons. Since psychiatry is rooted in this type of understanding, it is considered unfortunate that the division within its ranks should be along lines which confuse the major issue of psychiatry and obstruct the development of a systematic understanding of persons which is the major task of psychiatry. (21 ref)—*Journal abstract*.

5829. Scagnelli, Joan. (U North Carolina, Medical School) **A case of hypnotherapy with an acute schizophrenic.** *American Journal of Clinical Hypnosis*, 1974(Jul), Vol 17(1), 60-63.

5830. Schmideberg, Melitta. **My experience of psychotherapy.** *Journal of Contemporary Psychotherapy*, 1974(Sum), Vol 6(2), 121-127.—Describes an early personal disillusionment with psychoanalysis and psychoanalysts. It is suggested that the condition of psychiatry and psychotherapy today can probably be compared to that of medicine several hundred years ago, containing a mixture of common sense, practical experience and superstitions, medications and manipulations, some more harmful than helpful. (17 ref)

5831. Schutz, William. **My philosophy of psychotherapy.** *Journal of Contemporary Psychotherapy*, 1974(Sum), Vol 6(2), 129-131.—Presents in question and answer form the author's personal approach to psychotherapy, changes observed over time, the present state of the practice, and the role of psychotherapy in society.

5832. Slavson, S. R. **Concerning psychotherapy.** *Journal of Contemporary Psychotherapy*, 1974(Sum), Vol 6(2), 132-140.—Discusses the task of psychotherapy, fitting treatment to personality needs, and the responsibility for improvement of society. Based on 4 decades of experience with a large number of patients, it is felt that no complete cure is possible for adults in any type of psychological therapy. Guidance and therapy for pupils with problems in public education is held to be of major importance.

5833. Sorrel, William E. **Basic concepts of transference in psychoanalysis.** *Diseases of the Nervous System*, 1973(Apr), Vol 34(4), 158-159.—Discusses the concepts of positive and negative transference and of positive countertransference in the patient-therapist relationship. The function of transference is explained, and the desired degree of transference at the beginning and end of therapy is considered.

5834. Strauss, John S. & Carpenter, William T. (U Rochester, School of Medicine & Dentistry) **Evaluation of outcome in schizophrenia.** In D. F. Ricks, A. Thomas & M. Roff (Eds.), *Life history research in psychopathology: III*. Minneapolis, MN: University of Minnesota Press, 1974. x, 383 p.

5835. Thiemann, E. (Psychiatrische Klinik, Lüneburg, W Germany) **[Learning processes, motivational structures, and psychodynamics in mental patients: Guidelines contributing to the determination and mediation of therapeutic goals of learning.]** (Germ) *Nervenarzt*, 1972(May), Vol 43(5), 268-270.

5836. Ursano, Robert J. & Dressler, David M. (USAF Medical Ctr, Lackland, TX) **Brief vs. long term psychotherapy: A treatment decision.** *Journal of Nervous & Mental Disease*, 1974(Sep), Vol 159(3), 164-171.—Examined the treatment decision for brief psychotherapy in 99 cases evaluated in a community mental health center. The treatment decision was unaffected by the sociodemographic variables of the patients, but significantly affected by certain clinical, patient-clinician interactional, and institutional variables. Results do not support the concept of brief psychotherapy as supportive and long-term psychotherapy as explorative, but rather suggest a focal-nonfocal (multi-focal) model as accounting for

differences between brief and long-term psychotherapy. Implications for an institutional referral process are discussed. (27 ref)—*Journal abstract*.

5837. Walsh, Arthur C. & Walsh, Bernice H. (U Pittsburgh) **Presenile dementia: Further experience with an anticoagulant-psychotherapy regimen.** *Journal of the American Geriatrics Society*, 1974(Oct), Vol 22(10), 467-472.—Presents short histories of 10 42-71 yr old patients who responded well to combined anticoagulant-psychotherapy treatment. It is stressed that even in cases in which there is no significant improvement, the prevention of further deterioration is of great value. (16 ref)

5838. Warren, Neil C. (Ed.). **After therapy what? Lay therapeutic resources in religious perspective: The Second John G. Finch Symposium on Psychology and Religion.** Springfield, IL: Charles C Thomas, 1974. 205 p. \$11.75.—Presents a collection of 9 lectures and symposium papers on the relationships between psychotherapy and the Christian faith. Topics include the diffusion of therapeutic agency, the human potential and evangelical hope, and a psychological interpretation of T. C. Oden's theological substructure.

5839. Weisz, Stephen R. **The use of drama in therapy with psychotic patients.** *Journal of Pastoral Care*, 1974(Jun), Vol 28(2), 134-135.—Describes the involvement in a Christmas play of patients in a locked, chronic psychotic ward. Drama was used as a medium to develop a sense of community regardless of individual emotional turmoil.

5840. Wexler, David A. & Rice, Laura N. (Eds.). (U California, Medical School, San Francisco) **Innovations in client-centered therapy.** New York, NY: John Wiley & Sons, 1974. xi, 517 p. \$22.50.—Presents a collection of 15 papers on the theory, practice, and applications of client-centered counseling and psychotherapy. Topics include a cognitive theory of self-actualization, experiencing, and therapeutic process; measuring openness to experience in psychotherapy; the evocative function of the therapist; and Rogerian concepts in encounter groups.

5841. Zelig, Jeffrey K. **Hypnotherapy techniques with psychotic in-patients.** *American Journal of Clinical Hypnosis*, 1974(Jul), Vol 17(1), 56-59.—Discusses hypnotherapy techniques used with psychotic inpatients at a residential treatment center for adults.

### Drug Therapy & Drug Rehabilitation

5842. Adamson, L. et al. (E. R. Squibb & Sons, Ltd, Twickenham, England) **Fluphenazine decanoate trial in chronic in-patient schizophrenics failing to absorb oral chlorpromazine.** *Diseases of the Nervous System*, 1973(Apr), Vol 34(4), 181-191.—Ratings on the Brief Psychiatric Rating Scale indicate that inpatient schizophrenics whose plasma levels indicated nonabsorption of orally-administered chlorpromazine responded significantly better to intramuscularly administered fluphenazine decanoate.

5843. Albaugh, Bernard J. & Anderson, Philip O. (US Public Health Service Indian Hosp, Clinton, OK) **Peyote in the treatment of alcoholism among American Indians.** *American Journal of Psychiatry*, 1974(Nov), Vol 131(11), 1247-1250.—Examined the development and

effectiveness of a treatment program for alcoholism among American Indians. This program offers the alcoholic Indian both occupational and cultural therapy, including participation in the services of the Native American Church (peyote meetings). During these meetings, participants often ingest peyote (mescaline), which, like LSD, facilitates cathartic expression and enhances suggestibility. Although peyote meetings are not a cure for alcoholism, they do offer some specific advantages in the treatment of the unique problems of the Indian alcoholic. (20 ref)—*Journal abstract*.

5844. Ambrosino, Salvatore V. (State U New York, Medical School, Stony Brook) **Depressive reactions associated with reserpine.** *New York State Journal of Medicine*, 1974(May), Vol 74(5), 860-864.—Reviews the literature regarding potentially dangerous side effects of reserpine and presents 5 case histories. Studies indicate such factors as higher incidence of dose-related depression in patients treated for hypertension with rauwolfia or reserpine. Although many of the patients who developed depressive reactions had a history of depression, others had no history of previous psychiatric disorder. Depressive reactions also appear to be related to personality type as well as to dosage and duration of treatment. (21 ref)—*W. L. Hunt*.

5845. Anderson, William H. & Kuehnle, John C. (Massachusetts General Hosp, Boston) **Strategies for the treatment of acute psychosis.** *JAMA: Journal of the American Medical Association*, 1974(Sep), Vol 229(14), 1884-1889.—Discusses the management of acute-onset psychosis. The cornerstone of appropriate initial management is the timely use of high-potency antipsychotic chemotherapy. Under such a regimen, the psychosis may show substantial remission within a few hours. Hospital treatment may thus be averted, obviating the problems of social opprobrium, pessimism, and high cost. Inpatient treatment is necessary if the patient is suicidal or homicidal, if there is question of delirium, if there is no viable family or social support, or if the psychosis does not clear rapidly. Subsequent careful follow-up is required to avoid the pitfalls of reactivated psychosis and medication excessive in dose or duration. (16 ref)—*Journal abstract*.

5846. Ban, T. A. et al. (McGill U, Div of Psychopharmacology, Montreal, Quebec, Canada) **A transcultural study with clomacran: Comparison of two assessment methods.** *Current Therapeutic Research*, 1974(Sep), Vol 16(9), 971-989.—Clomacran, the chlorpromazine analog of the acridane series, was therapeutically effective in the treatment of 10 Canadian and 10 Mexican newly admitted schizophrenic patients. There was essentially no difference in the sensitivity of the 2 assessment methods (i.e., the Brief Psychiatric Rating Scale and the Psychopathological Assessment Scale) as far as therapeutic changes were concerned. While no difference between the sensitivity of the 2 methods for assessing therapeutic changes was seen, there were indications that for the description of psychiatric patient populations the Psychopathological Assessment Scale is more sensitive than the Brief Psychiatric Rating Scale. (15 ref)—*Journal abstract*.

5847. Bourgeois, M. [Insulin suicide: A new case of massive injection of insulin by a diabetic.] (Fren)

*Annales Médico-Psychologiques*, 1974(May), Vol 1(5), 631-640.—Although the suicide rate for diabetic patients is well below that for the general population, self-destruction does occur. In rare instances it takes the form of manipulating the therapy either actively and directly (self-damage) by altering the treatment drastically, or passively and indirectly (suicide equivalent) by resignation and giving up a treatment regime adequate to control the condition. A single case of attempted suicide by the massive injection of insulin (400 units) is described, and the techniques of its management are used as an outline for discussing emergency therapeutics, the hypoglycemic coma, and posthypoglycemic encephalopathy.—*H. E. King*.

5848. Brauzer, B.; Goldstein, B. J.; Steinbook, R. M. & Jacobson, A. F. (U Miami, Medical School) **The treatment of mixed anxiety and depression with loxapine: A controlled comparative study.** *Journal of Clinical Pharmacology*, 1974(Aug-Sep), Vol 14(8-9), 455-463.—Conducted a double-blind study of the effects of loxapine succinate in nonpsychotic outpatients exhibiting anxiety and depression symptoms. 115 Ss 21-65 yrs old received either 10-100 mg chlordiazepoxide, 2-20 mg loxapine, or placebo for 4 wks. Ss completed the Brief Psychiatric Scale and the Profile of Mood Status Scale. Blood counts, urinalysis, blood urea nitrogen, serum glutamic oxaloacetic transaminase, alkaline phosphatase, and bilirubin were assessed before and after treatment. Results indicate that loxapine was more effective in reducing the pathology. Chlordiazepoxide was significantly more effective than placebo. Side effects were mild to moderate, and occurred significantly more often in the loxapine-treated Ss.—*P. Federman*.

5849. Brien, Robert L.; Hough, Frederick & Braun, Philip R. (Temple U) **Drug dependency, acting-out and the hand test.** *Corrective & Social Psychiatry & Journal of Behavior Technology Methods & Therapy*, 1974(Sum), Vol 20(3), 28-30.—Administered the Hand Test to 30 active drug addicts, 23 chemotherapeutically maintained methadone patients, and 30 professional staff members of an inner-city nonresidential addictive treatment agency. Raw scores were obtained for 11 scoring classes (e.g., Aggression, Fear, Communication, Cripple, and Dependence) and Acting-Out Ratios (AORs) were computed. There was a significant difference in AORs between all groups ( $p < .01$ ), with addicts higher than staff and the maintenance sample, and the staff higher than the maintenance sample. Significant differences in individual components of the AOR and in the Cripple class were also noted. There was a general tendency toward overt Aggression and acting-out on the part of addicts (Aggression,  $p < .05$ ) and toward a pathological passivity in the maintenance group (Dependence,  $p < .01$ ), with significance between addicts and maintenance group ( $p < .01$ ) and between staff and maintenance groups ( $p < .05$ ). There were no significant Dependence differences between addicts and staff.—*J. Sorokac*.

5850. Charalampous, K. D.; Freemesser, G. F. & Smalling, Kathryn F. (Baylor Coll of Medicine, Houston, TX) **A double-blind controlled study of loxapine succinate in the treatment of anxiety neuroses.** *Journal of Clinical Pharmacology*, 1974(Aug-Sep), Vol 14(8-9), 464-469.—Studied the effects of loxapine in treating

anxiety neuroses in a double-blind, placebo-controlled design. Ss were 60 adult anxiety diagnosed outpatients divided equally into 3 groups, receiving either loxapine, doxepin, or placebo for 4 wks. Laboratory tests included CC, urinalysis, blood urea nitrogen, and liver function, bilirubin, serum glutamic oxaloacetic transaminase, serum glutamic pyruvic transaminase, and alkaline phosphatase. Clinical tests included the Brief Psychiatric Rating Scale, Hamilton Anxiety Scale, and the Symptom Check List. There were no significant differences in improvement among the 3 groups. 34 Ss experienced side effects, mostly mild to moderate. It is suggested that in anxiety diagnosed patients, many nonspecific variables are confounded with the main treatment variable studied. Larger sample sizes may be necessary to distinguish differences due specifically to pharmacotherapy. (18 ref)—*P. Federman*.

5851. Claghorn, James L. (Texas Research Inst of Mental Sciences, Houston) **A double-blind comparison of pimozide vs. trifluoperazine in schizophrenic outpatients.** *Current Therapeutic Research*, 1974(Sep), Vol 16(9), 1005-1009.—While pimozide did not achieve therapeutic superiority in a clinical trial with 87 chronic schizophrenic outpatients, it performed as well as trifluoperazine in relieving schizophrenic symptomatology. Pimozide caused few side effects and was effective at low doses. It is noted that extrapyramidal symptoms cause some patients to resist or discontinue treatment, a situation which often results in their hospitalization. For this reason an effective neuroleptic which produces few side effects, such as pimozide, is concluded to be a valuable addition to available therapeutic drugs. —*Journal abstract*.

5852. Covi, Lino & Alessi, Larry. (Johns Hopkins U, Medical School, Div of Clinical Psychopharmacology Research) **Pharmacological treatment of personality disorders.** In J. R. Lion (Ed), *Personality disorders: Diagnosis and management*. Baltimore, MD: Williams & Wilkins, 1974. xi, 432 p. \$21.—Based on a pathogenetic viewpoint, the use of psychotropic medication in the treatment of personality disorders is discussed. Specific disorders described include alcoholism, drug addiction, sexual deviance, hyperkinetic syndromes, and behavior disorders of old age. The importance of combining pharmacological therapies with other treatment modalities is emphasized. (63 ref)

5853. de Buck, R.; Titeca, R. & Pelc, I. (U Brussels Hosp, Inst of Psychiatry, Research Unit of Clinical Psychopharmacology, Belgium) **[Controlled study of anetholtrithione (Sulfarlem) on psychotropic drug-induced xerostomia.]** (Fren) *Acta Psychiatrica Belgica*, 1973(Jul), Vol 73(4), 510-519.—Administered anetholtrithione or placebo to 30 patients on neuroleptic and 30 on antidepressant medication in a double-blind procedure. The drug was effective in overcoming dryness of the mouth, and in some cases constipation. (Dutch, English, German, Italian, & Spanish summaries)

5854. Ekblom, B. & Haggstrom, J. E. (Ullerakers Hosp, Psychiatric Clinic, Uppsala, Sweden) **Clozapine (Leponex) compared with chlorpromazine: A double-blind evaluation of pharmacological and clinical properties.** *Current Therapeutic Research*, 1974(Sep), Vol 16(9), 945-957.—Clozapine was compared with chlorproma-

zine in a clinical study with 41 inpatients with acute schizophrenia or exacerbated chronic schizophrenia of the paranoid-hallucinatory or catatonic type. The Brief Psychiatric Rating Scale, laboratory tests, a study of side effects, and a blind final subjective global evaluation were used to analyze the results. The clinical effects of clozapine appeared to be at least fully comparable with those of chlorpromazine. Neither of the 2 drugs caused any extrapyramidal side effects. Counted in milligrams, the optimum dose of clozapine was somewhat lower than that of chlorpromazine. It is concluded that clozapine appears to be an interesting and useful drug, provided that the freedom from serious side effects is confirmed in larger studies. (21 ref)—*Journal abstract*.

5855. Fabre, L. F. & Harris, R. T. (U Texas, Medical School, Houston) **Pilot open-label study on U-31,889 in anxious in-patients.** *Current Therapeutic Research*, 1974(Sep), Vol 16(9), 1010-1013.—15 inpatients, diagnosed as experiencing anxiety neurosis of sufficient severity to require hospitalization, were treated with U-31,889 in an uncontrolled, open-label study. Anxiety symptoms were considerably ameliorated by the 1st period of evaluation which occurred after 11 days of treatment, and this improvement persisted throughout the 21-day study period. Side effects were negligible. Ophthalmologic examination, electrocardiogram, and hematologic, liver, kidney, and cardiac function, as determined by routine laboratory examination, were unaltered by U-31,889. —*Journal abstract*.

5856. Fann, William E.; Lake, C. Raymond & Majors, L. Frank. (Duke U, Medical Ctr) **Thioridazine in neurotic, anxious, and depressed patients.** *Psychosomatics*, 1974, Vol 15(3), 117-121.—Studied 59 Ss with symptoms of neurotic anxiety and depression in a double-blind, placebo-controlled treatment program. Thioridazine was significantly superior to placebo in alleviating symptoms of depression and anxiety. Side effects were mild, occurred only in a few Ss, and none had to discontinue the treatment. Thioridazine appears to be safe and effective in treating mild to moderate anxiety and depression. (52 ref)—*Journal abstract*.

5857. Goldberg, Harold L.; Finnerty, Richard J.; Nathan, Leon & Cole, Jonathan O. (Boston State Hosp, West-Ros-Park Mental Health Ctr, MA) **Doxepin in a single bedtime dose in psychoneurotic outpatients.** *Archives of General Psychiatry*, 1974(Oct), Vol 31(4), 513-517.—Assigned 41 psychoneurotic outpatients with mixed anxiety/depression and resultant sleep disturbances to receive either doxepin hydrochloride (50-300 mg/day) or a placebo at bedtime in a double-blind study for 4 wks. Scales used were the Lipman-Rickels Scale, the Psychiatric Outpatient Mood Scale, the Hamilton Anxiety Scale, and the Finnerty-Goldberg Sleep Evaluation Scale. Results indicate that doxepin, given at bedtime, was significantly more effective than a placebo in treating mixed anxiety/depression, as shown by all 3 psychiatric rating scales used and by overall evaluation, even when the improvement is controlled for pretreatment correlates of improvement. The prediction model indicated that Ss with higher occupational levels, more severe Hamilton mental rating, and less severe Hamilton behavior rating were more likely to improve. Bedtime dosing accelerated the antidepressive effect of doxepin

while yielding significant improvement in sleep patterns.

—*Journal abstract.*

5858. Gould, Leroy C. & Kleber, Herbert D. (Connecticut Mental Health Ctr. Drug Dependence Unit, New Haven) **Changing patterns of multiple drug use among applicants to a multimodality drug treatment program.** *Archives of General Psychiatry*, 1974(Sep), Vol 31(3), 408-413.—Reports an analysis of changing patterns of multiple drug use among 1,665 applicants to the Drug Dependence Unit of the Connecticut Mental Health Center during 1970-1973. The analysis, which subdivides applicants into 4 time cohorts according to when they began using drugs (before 1964, 1966, 1969, and 1972), discloses that polydrug abuse, if this means using a number of drugs, is not a new phenomenon and does not appear to be increasing. The use of heroin, however, and to some extent cocaine, has declined, as has also the association between heroin use and the use of other drugs. If this trend continues, treatment may be more difficult since nonopiate users are more difficult to treat separately. (20 ref)—*Journal abstract.*

5859. Guyot, M. P. [The action of dipotassium chlorazepate associated with insulin in the treatment of certain depressive states.] (Fren) *Annales Médico-Psychologiques*, 1974(May), Vol 1(5), 627-630.—The chance observation of an excellent therapeutic response to a novel medication used with an aged patient, whose agitated depression was not relieved by the major antidepressants, has led to its trial use in a larger clinical series including depressions of varied kinds. The history of the 1st patient showed that a partial positive response had been obtained, a year earlier, to a similar agitated state upon intramuscular injection of dipotassium chlorazepate. In view of her age (81 yrs), and extremely poor nutritional state, a mild dose of insulin was added to the chlorazepate, with the hope of improving alimentation. The positive response, rapidly obtained, has led to the hypothesis that small amounts of insulin (5 units), although too insubstantial to have any direct action, might facilitate the basic action of antidepressive medications. 70% of 70 patients, with clinically differing depressive states, treated with 90 mg chlorazepate combined with 5 units of insulin (injected intramuscularly) showed a positive response within 3 wks. Individual responses varied from apparently complete recovery to an elective sedation of the moral pain observed in patients suffering a punishing religious delusion. Further experimental trials are needed, especially as intramuscular injection of chlorazepate rapidly becomes painful and an equivalent dose-maintenance by oral medication has not yet been established.—*H. E. King.*

5860. Haskell, David S.; McNair, Douglas M.; Fisher, Seymour & Kahn, Richard J. (Boston U. Medical School) **A controlled outpatient trial of perphenazine-amitriptyline and chlorpromazine.** *Journal of Clinical Pharmacology*, 1974(Oct), Vol 14(10), 536-542.—Tested the hypothesis that treating both anxiety and depression in patients displaying both symptoms would be more beneficial. Evaluation measures included the treatment of anxiety only. The effects of perphenazine-amitriptyline (tranquilizer) and chlorpromazine (antidepressant) were compared in 33 nonpsychotic outpatients over a 4-wk period in a double-blind design. Minimal drug differences were

found. Small but consistent trends favored the combination agent. The combination was significantly less beneficial in Ss with coexisting depression. A high incidence of drowsiness was observed with both drugs.—*P. Federman.*

5861. Helser, Jon F. & Wilbert, Donald E. (U California, Medical School, Irvine) **Reversal of delirium induced by tricyclic antidepressant drugs with physostigmine.** *American Journal of Psychiatry*, 1974(Nov), Vol 131(11), 1275-1277.—Reports that 2 mg of physostigmine given intramuscularly was effective in reversing acute brain syndromes in 2 patients who had ingested toxic doses of drugs with anticholinergic properties (amitriptyline alone and an amitriptyline-perphenazine combination). Physostigmine also controlled 1 patient's tachycardia and tachypnea. Physostigmine may not control toxic effects of anticholinergic drugs when these effects are not mediated through cholinergic blockade. (21 ref)—*Journal abstract.*

5862. Hollister, Leo E. et al. (VA Hosp, Palo Alto, CA) **Protirelin (TRH) in depression.** *Archives of General Psychiatry*, 1974(Oct), Vol 31(4), 468-470.—Evaluated protirelin (thyrotrophin releasing hormone) as a treatment in depression in 2 independent investigations. Regardless of when protirelin was given in the course of depression, or how the course of the illness was measured, it seemed to be devoid both of therapeutic and of major adverse effects.

5864. Jus, A. et al. (Hôpital St Michel-Archange, Research Div, Quebec, Quebec, Canada) **Penfluridol: A long-acting oral neuroleptic as therapeutic agent in chronic schizophrenia.** *Current Therapeutic Research*, 1974(Oct), Vol 16(10), 1041-1058.—Investigated the effect of penfluridol treatment on 39 chronic schizophrenic inpatients. There were 2 stages of patient management—an open stage of 20 wks and a double-blind stage of 12 wks. Results show that (a) penfluridol maintained the level of improvement previously achieved by other short-acting neuroleptic drugs; (b) the drug produced further improvement, especially of social adaptation and activity; and (c) the incidence of extrapyramidal symptoms was significantly lower in comparison with that occurring during neuroleptic treatment before the study and during thioridazine treatment in the double-blind stage.—*M. E. Pounsel.*

5865. Knee, Steven T. & Razani, Javad. (U Southern California, Medical School) **Acute organic brain syndrome: A complication of disulfiram therapy.** *American Journal of Psychiatry*, 1974(Nov), Vol 131(11), 1281-1282.—Reviewed 243 consecutive admissions over a 3-mo period to a general psychiatric ward for the presence of acute organic brain syndrome in patients being treated with disulfiram for chronic alcoholism. 5 cases were identified. Treatment recommendations are presented.

5866. Kochar, Mahendra S. et al. (Medical Coll Wisconsin) **Dose-related alterations in metabolism of levodopa: Possible mechanism for hypertensive effect.**

*Journal of Clinical Pharmacology*, 1974(Aug-Sep), Vol 14(8-9), 448-454.—Studied metabolism of levodopa in 23 patients with Parkinsonism who received different doses of the drug. Dosages varied among Ss from 400-3,000 mg/day. Ss received a low 3-methoxy-4-hydroxymandelic acid (VMA) diet and no antidepressant or antihypertensive medication. 24-hr urine collections were analyzed for the excretion of levodopa, dopamine, dopac, homovanillic acid (HVA), norepinephrine plus epinephrine, metanephrines, and VMA. The quantities of urinary dopamine, dopac, and HVA varied directly with the dose of levodopa; the others increased as the dose of levodopa was increased. The ratio of dopac + HVA to dopamine, which reflects monoamine oxidase activity in the dopamine metabolic pathway, did not change significantly with differing doses of levodopa. A negative correlation was found between the dose of levodopa and the ratio of VMA to norepinephrine + epinephrine + metanephrines, which reflects monoamine oxidase activity in the norepinephrine + epinephrine metabolic pathway. Blood pressure was significantly lower in Ss receiving larger doses of levodopa. Results suggest that large quantities of dopamine formed as a result of high doses of levodopa act as a competitive inhibitor of monoamine oxidase relative to its other substrates.—P. Federman.

5867. Kollivakis, Thomas; Azim, Hassan & Kingstone, Eddie. (Allan Memorial Inst, Montreal, Quebec, Canada) A double-blind comparison of pimozide and chlorpromazine in the maintenance care of chronic schizophrenic outpatients. *Current Therapeutic Research*, 1974(Sep), Vol 16(9), 998-1004.—51 chronic schizophrenics who had been stabilized on neuroleptic medication were transferred to sustained-release chlorpromazine or pimozide under double-blind conditions. Both drugs demonstrated effectiveness not only in maintaining adequate control of the patients' symptomatology, but also in eliciting further remission of the manifestations of their psychosis. Of particular interest was the effectiveness of pimozide for the reduction or elimination of emotional withdrawal. The type and incidence of side effects were similar for both drug groups. Results indicate that both sustained-release chlorpromazine and pimozide provide optimal therapeutic effectiveness at the convenient once-a-day administration schedule.—*Journal abstract*.

5868. Kutt, Henn & Penry, J. Kiffin. (Cornell U, Medical Coll, New York) Usefulness of blood levels of antiepileptic drugs. *Archives of Neurology*, 1974(Nov), Vol 31(5), 283-288.—Considers that monitoring blood levels of patients receiving antiepileptic drugs facilitates individualization of dosage regimens, reveals irregular drug intake, and identifies the responsible agent in intoxicated patients on multiple drug therapy. Effective and toxic blood level ranges, as well as the range of levels expected with a given dose, are presented for the major antiepileptic drugs, including diphenylhydantoin, phenobarbital, primidone, ethosuximide, and carbamazepine. (65 ref)

5869. Lal, Samarthji & Ettigi, Prakash. (Queen Mary Veterans' Hosp, Montreal, Quebec, Canada) Comparison of thiopropazate and trifluoperazine on oral dyskinesia: A double blind study. *Current Therapeutic*

*Research*, 1974(Sep), Vol 16(9), 990-997.—Thiopropazate (30 mg/day) has been compared with trifluoperazine (15 mg/day) and with placebo in 12 53-88 yr old male inpatients with oral dyskinesia in a double-blind cross-over study. A double placebo technique and videotape assessment of patients were used both at rest and during a maze test. Thiopropazate had a significant antidyskinetic effect compared with placebo. There was no difference in effect between thiopropazate and trifluoperazine in 8 patients who completed the study.—*Journal abstract*.

5870. Leeton, John. (Monash U, Queen Victoria Memorial Hosp, Melbourne, Vic, Australia) Depression induced by oral contraception and the role of vitamin B6 in its management. *Australian & New Zealand Journal of Psychiatry*, 1974(Jun), Vol 8(2), 85-88.—Pharmacological depression may be induced in approximately 1 in 15 women taking oral contraception. This depression is possibly related to an upset in tryptophan metabolism which is shunted from the 5-hydroxytryptamine pathway to the kynurine pathway. The resulting depressive syndrome may be suppressed by vitamin B6 therapy in those women who have an absolute vitamin B6 deficiency. As laboratory confirmation of this deficiency is difficult, a safe daily dose of 50 mg vitamin B6 can be given empirically to all women complaining of depressive symptoms while taking oral contraception. 5872. Matta, B. et al. (U Puerto Rico, Medical School, Clinical Pharmacology Unit) Comparison of triazolam, flurazepam and placebo as hypnotic agents in pre-surgical patients. *Current Therapeutic Research*, 1974(Sep), Vol 16(9), 958-963.—Triazolam was better than placebo on 4 parameters: onset of sleep, duration of sleep, nocturnal awakenings, and quality of sleep. Flurazepam was better than placebo on nocturnal awakenings and quality of sleep. Triazolam was superior to flurazepam in sleep onset. Drug side effects were minimal and not significantly different from those with placebo.

5873. Mendles, J. & Frazer, A. (VA Hosp, Philadelphia, PA) Alterations in cell membrane activity in depression. *American Journal of Psychiatry*, 1974(Nov), Vol 131(11), 1240-1246.—Findings from a review of the literature and a series of related experiments led to a working hypothesis suggesting that there may be an abnormality in aspects of cell membrane properties that normally regulate the movement of electrolytes across the plasma membrane in a subgroup of depressed patients. These patients appear to be responsive to lithium, and there is evidence that the postulated abnormality may be genetically determined. The potential usefulness of the erythrocyte as a model for studying electrolyte transport in neurons is discussed. (62 ref)—*Journal abstract*.

5874. Nieto, Dionisio. (National Autonomous U, Mexico City, Mexico) [The multidrug (polypharmacy)]

problem and the choice of psychoactive drugs.] (Span) *Archivos de Neurobiologia*, 1972(May), Vol 35(3), 197-204.—Analyzes the problems of drug use in contemporary psychiatry. Most patients have to be on drugs for long periods of time. Many drugs interact with metabolic processes and interfere with the normal functioning of the organism. When several drugs are given at the same time, the effect on the patient may be altered. Combinations of drugs should be avoided because contemporary pharmacology does not know enough about potential reactions to them. A few instances of beneficial combinations are presented.—*R. Ardila*.

5875. Nistico, G.; Ragozzino, D. & Marano, V. (U Naples, IInd Faculty of Medicine, Italy) **A comparative study of penfluridol and flupentixol in the treatment of chronic schizophrenia.** *Journal of Clinical Pharmacology*, 1974(Aug-Sep), Vol 14(8-9), 476-482.—Conducted a placebo-controlled experiment with 40 male chronic schizophrenics 23-60 yrs old, divided randomly into 2 groups of 20 each. 10 Ss in Group 1 received penfluridol for 6 wks (doses adjusted for each S to find the optimum therapeutic level) the other 10 received placebo. In Group 2, 10 Ss received penfluridol and 10 received flupentixol for 6 wks. Wing's rating scale was used for clinical assessment. Penfluridol was more effective than placebo. No difference was found between penfluridol and flupentixol, except that antipsychotic activity started after 2 wks of treatment with flupentixol and after 4 wks of treatment with penfluridol. This suggests that the former drug may be better for attack therapy with chronic schizophrenia, whereas the latter drug seems more suitable for maintenance therapy with long-lasting activity. Both drugs decreased autistic withdrawal, increased the degree of socialization and initiative and the use of more coherent language, and decreased certain behavioral disorders. (21 ref)—*P. Federman*.

5876. Ota, K. Y.; Kurland, A. A.; Rocha, J. & Block, B. A. (Spring Grove Hosp Ctr, Maryland Psychiatric Research Ctr, Catonsville) **A comparison of the relative clinical efficacy of two chlorpromazine (CPZ) preparations.** *Current Therapeutic Research*, 1974(Sep), Vol 16(9), 1014-1021.—Compared the pharmacological efficacy of 2 brands of chlorpromazine, A and B, in 25- and 200-mg tablets. 71 adult hospitalized chronic psychotic patients, who had been treated with B (the standard chlorpromazine) as routine hospital treatment, were selected in terms of physical condition, previous dosage level of medication, and present psychiatric condition. After a baseline observation period of a few weeks, during which time they received placebo, the patients were randomly assigned under double-blind conditions to either chlorpromazine A or B, and maintained on their medications for 6 wks, at which time the crossover of chlorpromazine A and B took place. Analysis of data revealed that the clinical therapeutic actions of both chlorpromazine A and B were similar in terms of psychiatric ratings, laboratory tests, and adverse reactions.—*Journal abstract*.

5877. Overall, John E. (U Texas, Medical Branch, Galveston) **The Brief Psychiatric Rating Scale in psychopharmacology research.** In P. Pichot, R. Olivier-Martin (Eds), *Psychological measurements in psychophar-*

*macology*. Basel, Switzerland: S. Karger, 1974. 267 p. \$35.75.

5878. Overall, John E.; Hollister, Leo E. & Pokorny, Alex D. (U Texas, Medical Branch, Galveston) **Alcohol history in drug treatment.** *Diseases of the Nervous System*, 1973(Apr), Vol 34(4), 175-180.—Based on ratings of patients in 2 separate studies using the Brief Psychiatric Rating Scale and the Factor Construct Rating Scale, it is concluded that patients with the syndrome of mixed anxiety and depression respond differently to phenothiazines and benzodiazepines depending on their prior history of alcohol abuse. Patients with alcohol abuse histories responded better to the phenothiazines (acetophenazine and mesoridazine) and also generally had symptoms of longer duration. Patients without histories of alcohol abuse responded best to the benzodiazepines (diazepam and chlordiazepoxide), and their symptoms had a less chronic course. Results emphasize that treatment of depressed patients with drugs should not be an automatic reflex based on the type of depressive syndrome, but should also be based on relevant history variables such as alcohol abuse.

—*Journal summary*.

5879. Page, John G. et al. (Abbott Lab, Pharmaceutical Products Div, N Chicago, IL) **Pemoline (Cylert) in the treatment of childhood hyperkinesia.** *Journal of Learning Disabilities*, 1974(Oct), Vol 7(8), 498-503.—Conducted a controlled, double-blind study using pemoline and placebo in the management of hyperkinetic behavior associated with minimal brain dysfunction. 413 6-12 yr old children were evaluated in terms of the drug's safety, of whom 238 were rated on the drug's efficacy. Improvement in gross behavior as measured by parent, teacher, and physician global evaluations, as well as improvement in cognitive and perceptual function as measured by psychological tests, was recorded for the pemoline group. This was achieved with minimal side effects on a once-daily dosage regimen, indicating that pemoline is a highly useful clinical alternative to the amphetamines and methylphenidate as an adjunct in the management of hyperkinetic behavior.—*Journal abstract*.

5880. Pakkenberg, H. & Fog, R. (Kommunehospitalet, Copenhagen, Denmark) **Spontaneous oral dyskinesia: Results of treatment with tetrabenazine, pimozide, or both.** *Archives of Neurology*, 1974(Nov), Vol 31(5), 352-353.—Reports the treatment of 16 patients with tetrabenazine, pimozide, or both. Oral dyskinesia was eliminated by both drugs. If the hyperkinesia reappears, the 2 drugs in combination can be permanently efficient.

5881. Pauling, Linus. (Linus Pauling Inst of Science & Medicine, Menlo Park, CA) **On the orthomolecular environment of the mind: Orthomolecular theory.** *American Journal of Psychiatry*, 1974(Nov), Vol 131(11), 1251-1257.—Defines orthomolecular psychiatry as the achievement and preservation of good mental health by the provision of the optimum molecular environment for the mind, especially the optimum concentrations of the substances normally present in the human body (e.g., vitamins). There is sound evidence for the theory that increased intake of such vitamins as ascorbic acid, niacin, pyridoxine, and cyanocobalamin is useful in treating schizophrenia. The negative conclusions of a recent report by the American Psychiatric Association

on megavitamin and orthomolecular therapy are felt to result not only from faulty arguments and from a bias against megavitamin therapy but also from a failure to deal fully with orthomolecular therapy in psychiatry. Comments by 3 psychiatrists follow Pauling's presentation. (35 ref)—*Journal abstract*.

5882. Pichot, P. & Olivier-Martin, R. (Eds.). (Ctr Psychiatrique Sainte Anne, Paris, France) **Psychological measurements in psychopharmacology**. Basel, Switzerland: S. Karger, 1974. 267 p. \$35.75.

Olivier-Martin (Eds), *Psychological measurements in psychopharmacology*. Basel, Switzerland: S. Karger, 1974. 267 p. \$35.75.

5884. Sathananthan, Gregory L.; Angrist, Burton M.; Phillips, Neil & Gershon, Samuel. (New York U, Medical Ctr, Neuropsychopharmacology Research Unit) **Assessment of antipsychotic activity of a butyrophenone analogue, lenperone (AHR 2277)**. *Current Therapeutic Research*, 1974(Aug), Vol 16(8), 844-847.—10 schizophrenic inpatients were administered 10-150 mg of lenperone daily for 21-28 days. Ss were evaluated on a battery of behavioral measures (including the Brief Psychiatric Rating Scale, the Clinical Global Impression, and the Nurses Observation Scale for Inpatient Evaluation) before, twice weekly, and at termination of treatment. 2 patients showed complete remission of symptoms, 4 were unchanged except for reduced anxiety, and 4 showed fluctuations of psychopathology. Side effects were evident in patients. It is concluded that lenperone has some psychoactive properties and might be useful in treatment of schizophrenic psychoses. Further controlled studies with larger populations are suggested to determine whether lenperone is an effective tranquilizer.—*B. McLean*.

5885. Scheiner, James J. & Richards, David J. (Boulevard Medical Ctr, Fairfax, VA) **Treatment of musculoskeletal pain and associated anxiety with an ethoheptazine-aspirin-meprobamate combination (E-quagesic): A controlled study**. *Current Therapeutic Research*, 1974(Sep), Vol 16(9), 928-936.—The ethoheptazine-aspirin-meprobamate combination proved significantly superior to aspirin-ethoheptazine and to meprobamate alone in relief of pain and significantly more effective than the aspirin-ethoheptazine combination in relieving anxiety in 102 ambulant outpatients.

5886. Schultenbrandt, Joy G.; Raskin, Allen & Reatig, Natalie. (NIMH, Ctr for Studies of Child & Family Mental Health, Rockville, MD) **True and apparent side effects in a controlled trial of chlorpromazine and imipramine in depression**. *Psychopharmacologia*, 1974, Vol 38(4), 303-317.—Administered chlorpromazine (600 mg/day) and imipramine (300 mg/day) or placebo to 555 acutely depressed patients (median age, 42 yrs) to determine the incidence and severity of drug-related side effects. The ability of clinicians to distinguish between drug-related side effects and symptoms natural to the depressive illnesses was also investigated. Side effects were minimal for both active drug groups. Among the dropouts for serious side effects (31 cases), the majority were receiving chlorpromazine. Skin rash and hypoten-

sion were the most frequent reasons for side-effect terminations. Clinicians were generally able to distinguish drug-related side effects from symptoms usually associated with depression. There was some indication, however, that they tended to rate as non-medication-related, certain symptoms which were actually drug-induced. The latter included muscle rigidity, edema, and dry mouth on chlorpromazine and tremulousness on imipramine. (17 ref)—*Journal abstract*.

5887. Smith, G. R.; Taylor, C. W. & Linkous, P. (Meadowbrook Extended Care Facility, Shawsville, VA) **Haloperidol versus thioridazine for the treatment of psychogeriatric patients: A double-blind clinical trial**. *Psychosomatics*, 1974, Vol 15(3), 134-138.—46 geriatric patients who were behavior problems due to chronic brain syndromes or senile psychosis were treated with haloperidol or thioridazine under double-blind conditions. Both compounds were significantly effective in reducing agitation, disruptive behavior, and psychotic symptomatology. Haloperidol was effective over a broader range of symptomatology than thioridazine. Haloperidol consistently produced significant improvement in symptoms that reflect social interaction, alertness, and interest. Each rating method (Brief Psychiatric Rating Scale, Nurses' Observation Scale for Inpatient Evaluation, Psychiatric Evaluation Form, and global evaluation) showed significant improvement in both the haloperidol- and thioridazine-treated groups, the results favoring haloperidol treatment in each case. Adverse reactions were infrequent and mild. The type and incidence of side effects was similar for both drug groups.—*Journal abstract*.

5888. van Praag, Herman M.; Van den Burg, Willem; Bos, Erik R. & Dols, Louise C. (U Groningen, Psychiatric Clinic, Netherlands) **5-Hydroxytryptophan in combination with clomipramine in "therapy-resistant" depressions**. *Psychopharmacologia*, 1974, Vol 38(3), 267-269.—In 4 depressive patients, regarded as therapy-resistant, the antidepressive effect of levo-5-hydroxytryptophan (in combination with a peripheral decarboxylase inhibitor) was enhanced by clomipramine at a dosage which, as such, was suboptimal. This probably means that the therapeutic effect of levo-5-hydroxytryptophan is based on increase of serotonin at central serotonin receptors.—*Journal abstract*.

5889. Vista Hill Psychiatric Foundation. (San Diego, CA) **Methadone diversion**. *Drug Abuse & Alcoholism Newsletter*, 1974(Aug), Vol 3(4), 4 p.—Discusses the problem of methadone diversion, i.e., the illicit trade of methadone to addicts. A study of this activity in 5 cities, commissioned by the National Institute of Drug Abuse, is reported. Survey results indicate that the practice is widespread and that the chief source of illicit methadone is patients attending methadone maintenance clinics. The significance of this for the client, the treatment program, the addict population, and the community is examined. It is concluded that methadone maintenance has value and should continue, but that methadone diversion should be reduced to the lowest possible level.—*R. Hall*.

5890. Weiss, Brian L.; Foster, F. Gordon; Reynolds, Charles F. & Kupfer, David J. **Psychomotor activity in mania**. *Archives of General Psychiatry*, 1974(Sep), Vol

31(3), 379-383.—Investigated the levels of psychomotor activity during mania and the effects of lithium carbonate and clinical change on activity levels. Activity data were collected continuously by means of a telemetric mobility-sensing system. The study was divided into 3 sections: the monitoring of 3 manic patients (aged 22, 50, and 60 yrs) during a pretreatment baseline period, the study of 6 patients (the above 3 manic patients and 3 bipolar depressives aged 50, 24, and 39 yrs) before and during lithium carbonate treatment, and the intensive longitudinal investigation of a manic patient over a 5-mo period. Results indicate that both the quantity and patterning of manic activity were substantially different from other diagnostic groups previously studied. Activity levels do not appear to be affected by the use of lithium carbonate unless associated with clinical change. (27 ref)—*Journal abstract*.

5891. Wittenborn, J. Richard. (Rutgers State U, Interdisciplinary Research Ctr, New Brunswick) **A search for responders to niacin supplementation.** *Archives of General Psychiatry*, 1974(Oct), Vol 31(4), 547-552.—Attempted to identify characteristics distinguishing schizophrenic patients who responded well to niacin supplementation from good responders in a control group. Good responders in the niacin group showed premorbid histories with relatively strong interpersonally oriented commitments, while the good responders in the controls did not.

5892. Zung, William W. et al. (Duke U, Medical Ctr) **Pharmacology of depression in the aged: Evaluation of Gerovital H3 as an antidepressant drug.** *Psychosomatics*, 1974, Vol 15(3), 127-131.—Carried out a double-blind trial of 30 geriatric patients with depressive illness, who received either Gerovital-H3 by injection or placebo or imipramine orally for 4 wks. Treatment schedules were as follows: (a) 5-10 cc Gerovital (as 2% procaine hydrochloride) or placebo 3 times/wk; and (b) 1-4 capsules/day containing 25 mg imipramine, or placebo. Pre- and posttreatment tests, using the clinical Global Impression Scale and the Zung Self-Rating Depression Scale, showed Gerovital-H3 to be superior to imipramine.—A. S. Kulkarni.

### Behavior & Group Therapy

5893. Alterman, Arthur I.; Gottheil, Edward; Skoloda, Thomas E. & Grasberger, Joseph C. (VA Hosp, Coatesville, PA) **Social modification of drinking by alcoholics.** *Quarterly Journal of Studies on Alcohol*, 1974(Sep), Vol 35(3-A), 917-924.—During a 6-wk experimental treatment program in which patients could choose to drink, 44 male alcoholics (mean age, 44) attended group discussions prior to the drinking decisions phase of the program. The therapist reinforced 20 patients to take a few drinks (Group I) and 24 to abstain (Group II). The patients' commitments concerning plans for drinking or abstinence were recorded. Of the 20 men in Group I, 9 made commitments to drink and 13 subsequently drank; 15 of the 24 in Group II made commitments not to drink and 16 subsequently remained abstinent. It is concluded that social reinforcement of abstinence within a group setting can effectively reduce the number of patients drinking; the reinforcement of drinking, however, had no appreciable effect.—*Journal abstract*.

5894. Balcerzak, Wallace S. & Siddall, James W. (U Wisconsin, Milwaukee) **A brief discussion of a model for improving the cost effectiveness of a token economy in a rehabilitation setting.** *Journal of Applied Behavior Analysis*, 1974(Fal), Vol 7(3), 501-504.—Describes a possible method for analyzing the cost effectiveness of a token economy in a sheltered workshop where subcontracted goods are produced. Analysis indicates that the cost of a token economy could be decreased or eliminated by various financial and staffing alternatives.

5895. Borkovec, Thomas D. (U Iowa) **Heart-rate process during systematic desensitization and implosive therapy for analog anxiety.** *Behavior Therapy*, 1974(Oct), Vol 5(5), 636-641.—Used systematic desensitization, implosive therapy, and an avoidance response placebo procedure for the treatment of analog anxiety in 36 female college students with snake phobia. Heart-rate data were collected to supplement previously reported basal skin conductance results. Repeated conditioned stimulus (CS) exposure did result in general arousal reduction under desensitization and implosion regimes, while CS exposure paired with visualized avoidance responding was related to arousal maintenance.—*Journal abstract*.

5896. Bostock, Tudor & Williams, Christopher L. (Royal Hobart Hosp, Tasmania) **Attempted suicide as an operant behavior.** *Archives of General Psychiatry*, 1974(Oct), Vol 31(4), 482-486.—In the light of the increased incidence of attempted suicide and the stress this imposes on medical resources, alternative approaches to management need to be considered. Where it can be established that the suicidal behavior has an operant component, management according to behavioral principles would appear relevant. The behavior of a 20-yr-old woman who exhibited repeated suicidal behavior was managed within a ward program by means of operant principles. After 27 mo of follow-up, there has been no recurrence for 18 mo. (18 ref)—*Journal abstract*.

5897. Cantón-Dutari, Alejandro. (Clinica Presidente Remón, Panama City, Panama) **[The use of systematic desensitization in the treatment of an airplane phobia.]** (Span) *Revista Latinoamericana de Psicología*, 1974, Vol 6(2), 151-156.—Describes the treatment of a 27-yr-old woman with fear of flying characterized by tachycardia, muscular tension without hypermotility, and involuntary images of planes crashing. Systematic desensitization and a method of muscular contraction-relaxation to counteract the tension-producing stimuli were used and the patient was allowed to monitor herself during the 1-wk intervals between the 5 treatment sessions. 2 mo after treatment the patient made a plane trip of more than 2 hrs without the phobic reaction. (English summary)—V. A. Colotta.

5898. Claghorn, James L.; Johnstone, Edwin E.; Cook, Thomas H. & Itschner, Lorri. (Texas Medical Ctr, Texas Research Inst of Mental Sciences, Houston) **Group therapy and maintenance treatment of schizophrenics.** *Archives of General Psychiatry*, 1974(Sep), Vol 31(3), 361-365.—Used group psychotherapy and antipsychotic medications in the treatment of 49 17-59 yr old outpatient schizophrenics. 2 treatment regimens, using thiothixene and chlorpromazine hydrochloride, were divided into group therapy and nongroup therapy

subgroups for 6 mo. Patients' symptoms were evaluated on a monthly basis with a physician's global assessment and the Brief Psychiatric Rating Scale. Subtle changes in Ss' interpersonal emotional adjustment were measured before and after treatment by the Interpersonal Test Battery. Results indicate no substantial difference between medications but a positive change over this time period for both drug regimens. While group therapy did not alter patients' symptomatology, it did, according to projective test results, deepen the Ss' awareness and insight into their own behavior.—*Journal abstract.*

5899. Court, J. H. (Flinders U South Australia, Bedford Park) **Behaviour therapy.** *Interchange*, 1974, No 15, 129-142.—Considers that behavior therapy, developed as a technique for the control and modification of behavior, does not present new ethical problems but does bring a number of issues into focus because of its relative effectiveness in achieving its intended goals. Attention is drawn to divergent trends, emphasizing experimental rigor vs a broad-spectrum use of techniques. It is argued that the assumptions of strict behaviorism are not essential in order to endorse the practices of behavior therapy. The ethical issues are largely related to the freedom of choice which a patient may exercise. Good behavior therapy not only respects the individual's freedom to participate in or reject the offer of therapy, but also, as a result of successful therapy, allows the individual to have a greater degree of control over his own actions. Such a position is consistent with a Christian view of the dignity and worth of man.—*Journal summary.*

5900. Croghan, Leo M. (Washington U) **Encounter groups and the necessity for ethical guidelines.** *Journal of Clinical Psychology*, 1974(Oct), Vol 30(4), 438-445.—Outlines the origin and development of the 28-yr-old encounter group movement and reports the various claims of the movement's proponents and the criticisms of its detractors. The debate over the ethical implications of the encounter movement is highlighted, and the 1973 American Psychological Association publication, *Guidelines for Psychologists Conducting Growth Groups*, is suggested for further reading. (16 ref)—*Journal summary.*

E. Hardy & J. G. Cull (Eds), *Group counseling and therapy techniques in special settings*. Springfield, IL: Charles C Thomas, 1974. ix, 166 p.—Describes the goals and methods of SEED, a drug treatment program based on the treatment model developed by Alcoholics Anonymous. The background of program participants, the service delivery system, staffing and training, and the program's impact and results are discussed.

5902. Cull, John G. & Hardy, Richard E. (Virginia Commonwealth U, Fishersville) **Marital counseling in groups.** In R. E. Hardy & J. G. Cull (Eds), *Group counseling and therapy techniques in special settings*. Springfield, IL: Charles C Thomas, 1974. ix, 166 p.—Suggests that group counseling is a valid approach in discriminating between actual and reported behavior in marital counseling. 8 types of marital partners are described—the aggressor, acceptance seeker, sympathy

seeker, confessor, externalizer, isolate, dominator, and antagonist. Procedures are discussed for accommodating each type within the group setting.

5903. Dengrove, Edward. (American Society of Psychosomatic Dentistry & Medicine, Brooklyn, NY) **Thought-block in behavior therapy.** *Journal of the American Society of Psychosomatic Dentistry & Medicine*, 1974, Vol 21(1), 19-24.—Suggests that conditioning by distraction rather than aversion holds promise of training individuals to control thoughts effectively by blocking out unwanted ideas.

5904. DiScipio, William J. (Ed.). (Bronx State Hosp, NY) **The behavioral treatment of psychotic illness: Advances in theory and technique.** New York, NY: Behavioral Publications, 1974. 240 p.

5905. Duncan, Jack A. (Virginia Commonwealth U) **Group counseling with adolescents in the school setting.** In R. E. Hardy & J. G. Cull (Eds), *Group counseling and therapy techniques in special settings*. Springfield, IL: Charles C Thomas, 1974. ix, 166 p.—Discusses 3 major group procedures as they relate to treating adolescents—group counseling, group guidance, and group psychotherapy. In addition to providing other background information, discussions are included on the time and frequency of meetings, the counselor's and the counsellee's role, the 1st session, continuation of group sessions, precautionary measures, and the final sessions.

5906. Emmelkamp, Paul M. & Ultee, Kees A. (Inst for Clinical & Industrial Psychology, Utrecht, Netherlands) **A comparison of "successive approximation" and "self-observation" in the treatment of agoraphobia.** *Behavior Therapy*, 1974(Oct), Vol 5(5), 606-613.—Used a crossover design, with 16 agoraphobic adults, employing successive approximation and a self-observation method in which the client was not reinforced by the therapist. Assessments were made by the therapist and by an independent O at the beginning of treatment, at crossover, at the end of treatment, and at the follow-up 3 mo later. Ss were administered a phobic anxiety scale, phobic avoidance scale, social anxiety scale, the Fear Survey Schedule, Self-Rating Depression Scale, and Internal-External Control Scale. Both treatments resulted in significant improvement on several variables. There was no significant difference between successive approximation and self-observation on any of the variables.—*Journal abstract.*

5907. Epstein, Leonard H. et al. (Auburn U) **Generality and side effects of overcorrection.** *Journal of Applied Behavior Analysis*, 1974(Fal), Vol 7(3), 385-390.—Evaluated the effects and side effects of overcorrection for self-stimulatory behaviors of a 5-yr-old male and an 8-yr-old male in a specialized day-care program. For one child, a "hand" overcorrection procedure involving arm and hand exercises was introduced contingent upon inappropriate hand movements and later contingent upon inappropriate foot movements. After "hand" overcorrection was withdrawn for inappropriate foot movements, a "foot" overcorrection procedure involving foot and leg exercises was introduced contingent upon inappropriate foot movements. For the 2nd child, the "hand" overcorrection procedure was introduced contingent upon inappropriate hand movements during a free-play period and was later contingent upon inappropriate

vocalizations at nap-time. "Hand" overcorrection was withdrawn and then reintroduced sequentially for both behaviors. Results indicate the "hand" overcorrection procedure suppressed inappropriate hand movements and inappropriate behaviors that were topographically dissimilar. Inverse relationships were observed between the 2nd child's inappropriate hand movements and appropriate toy usage during free play and between his inappropriate vocalizations and inappropriate foot movements during nap-time. Results suggest that overcorrection procedures that are effective for one behavior can be used to reduce the frequency of topographically different behaviors.—*Journal abstract.*

5908. Ewing, John A. (U North Carolina, Medical School, Chapel Hill) **Behavioral approaches for problems with alcohol.** *International Journal of the Addictions*, 1974, Vol 9(3), 389-399.—Considers that many alcoholics cannot withstand the rigorous requirements of psychoanalysis and that the completion of such treatment does not necessarily guarantee that alcoholics will be able to drink in moderation. A holistic approach to alcoholism treatment is therefore urged using any or all methods of therapy that appear appropriate. Behavioral approaches to alcoholism are compared to, and shown to be compatible with psychodynamic views of the problem. These approaches fall into 2 categories: techniques to develop aversion or indifference to alcohol combined with a view of ultimate abstinence, and techniques to replace alcoholic drinking patterns with controlled patterns. Evidence for the success of aversive approaches is presented, and it is suggested that these be considered when available and when a total abstinence program has been decided upon by both patient and therapist. Current attempts to develop moderate drinking in alcoholics are still only in the developmental stage and require further research and longer follow-up evaluations. (67 ref)—*Journal summary.*

5909. Fielding, John M. **Problems of evaluative research into group psychotherapy outcome.** *Australian & New Zealand Journal of Psychiatry*, 1974(Jun), Vol 8(2), 97-102.—Reviews the literature, noting that evaluative research has lagged behind clinical applications of group psychotherapeutic methods. Historical, social, and cultural factors, as well as diverse theoretical orientations and a preoccupation with the differences between various group approaches, have contributed to the dilemma of defining group psychotherapy. A variety of research strategies have been developed to assess group psychotherapy outcome. Approaches using construct criteria, with an individualized outcome for each patient, would seem to offer the most potential for future outcome studies. It is concluded that many variables influence evaluative research in group psychotherapy, and that the conventional research approach of a controlled clinical trial has limited feasibility. (70 ref)—*Journal abstract.*

5910. Foley, Vincent D. & Dyer, Wayne W. (St John's U, Jamaica, NY) **"Timing" in family therapy: The "when," "how," and "why" of intervention.** *Family Coordinator*, 1974(Oct), Vol 23(4), 373-382.—The timing of family therapy, the "when" of intervention, can be taught to the beginning therapist. The manner or the "way" in which interventions are made, although in part

dependent on the personality and skill of the therapist, can also be suggested. The rationale or the reasons "why" interventions are made can be explained in the light of the goals of growth and development of the family system. 8 occasions illustrating the "when," the "how," and the "why" behind therapeutic intervention in family therapy are presented.—*Journal abstract.*

5911. Foley, Vincent D. **An introduction to family therapy.** New York, NY: Grune & Stratton, 1974. xiv, 207 p.—Presents a discussion of the major concepts and theorists in family psychotherapy. Topics include the applicability of double bind, pseudomutuality, and systems concepts to family therapy, similarities and differences in the major theoretical approaches to family therapy, and an ecological perspective of the future of family therapy. (8 p ref)

5912. Franks, Cyril M. & Wilson, G. Terence (Eds.). (Rutgers State U, Psychological Clinic, New Brunswick) **Annual review of behavior therapy: Theory & practice: 1974.** New York, NY: Brunner/Mazel, 1974. xiv, 769 p. \$25.

5913. Fried, Robert. (Hunter Coll, City U New York) **A device for enuresis control.** *Behavior Therapy*, 1974(Oct), Vol 5(5), 682-684.—A simple, compact, and inexpensive device consisting of an oscillator and transmitter operating in the frequency modulation band is described in its application to the detection and control of enuresis.

5914. Haller, Linda L. (Western Psychiatric Inst & Clinic, Community Mental Health Ctr, Pittsburgh, PA) **Family systems theory in psychiatric intervention.** *American Journal of Nursing*, 1974(Mar), Vol 74(3), 462-463.—Applies concepts from systems theory to family therapy. Interventions into a family system with problems requires 3 kinds of data for evaluation: (a) process information from the family session, (b) covert and overt rules maintaining family relationships, and (c) types of interventions that affect the family systems. The unit of treatment in this model is the family system. 4 systems concepts are identified as basic for intervention in the family system: (a) The family system has an ego emotional mass that is affected by the level of dysfunction of members of the system. (b) The family system has a homeostatic regulation which limits individual changes of behavior. (c) One member of the family system can be identified as absorbing the tension of the system. (d) Patterned interactions maintain the status quo of the family system. The systems concept is applied in a case illustration of a family seeking professional psychotherapy intervention.—*R. G. Gibson.*

5915. Hardy, Richard E. & Cull, John G. (Eds.). (Virginia Commonwealth U) **Group counseling and therapy techniques in special settings.** Springfield, IL: Charles C Thomas, 1974. ix, 166 p.

5916. Hardy, Richard E. & Cull, John G. (Virginia Commonwealth U) **Group counseling with public offenders.** In R. E. Hardy & J. G. Cull (Eds.), *Group counseling and therapy techniques in special settings.* Springfield, IL: Charles C Thomas, 1974. ix, 166 p.—Emphasizes the importance of group leaders to facilitate prisoners' overcoming hostility toward treatment. Flexibility is suggested as the most important feature of any prisoner group-counseling program.

5917. Harris, Sandra L.; Hershfield, Robin E.; Kaffashan, Lucille C. & Romanczyk, Raymond G. (Rutgers State U, Douglass Coll, New Brunswick) **The portable time-out room.** *Behavior Therapy*, 1974(Oct), Vol 5(5), 687-688.—Suggests that the tantrum behavior of highly self-stimulatory children may be controlled through the use of a 3-panel screen employed as a time-out room.
5918. Jackson, Donald A. & Wallace, R. Frank. (U Kansas) **The modification and generalization of voice loudness in a fifteen-year-old retarded girl.** *Journal of Applied Behavior Analysis*, 1974(Fal), Vol 7(3), 461-471.—Treated a 15-yr-old severely disturbed girl for aphonia. Because of the extent of her withdrawal, the S was conditioned in a laboratory setting and received tokens for speaking loudly enough to operate a voice-operated relay. Conditioning at first consisted of saying 100 monosyllabic words, with the possibility of reinforcement on each word. Later, the S was required to say a polysyllabic word, and finally, 5 or 6 words per token. The S was shaped to speak with normal loudness in the laboratory, and generalization to a reading situation in the laboratory was measured and observed to occur, at first for a few minutes, and later for a longer period. Generalization to a reading situation in the classroom did not occur, but the S's voice loudness also increased in the classroom when several new reinforcement contingencies were put into effect there. (25 ref)—*Journal abstract*.
5919. Jonckheere, P. [Beyond hallucinogenic drugs: The case of Solange.] (Fren) *Acta Psychiatrica Belgica*, 1973(Jul), Vol 73(4), 497-509.—Illustrates the use of family intervention in the case of a 19-yr-old female with hashish dependence. (Dutch, English, German, Italian, & Spanish summaries)

5922. Kazdin, Alan E. (Pennsylvania State U) **The effect of model identity and fear-relevant similarity on covert modeling.** *Behavior Therapy*, 1974(Oct), Vol 5(5), 624-635.—Investigated the efficacy of covert modeling procedures on snake avoidance in 84 undergraduates. In a 2 × 2 design, model identity (imagining oneself vs imagining someone else as the covert model) and fear-relevant model similarity (coping vs mastery model) were examined. In 2 sessions Ss imagined approach behavior of a covert model. A no-model control group, which imagined fear-relevant scenes without a model, was included in the design. Model identity did not affect treatment outcome. Ss who imagined themselves or another person improved. Fear-relevant similarity was consistently related to avoidance reduction. On behavioral, arousal, anxiety, and attitudinal measures of avoidance, coping-model Ss evinced greater improvement than mastery-model Ss at posttreatment and at a 3-wk follow-up assessment. Implications of the results for modeling and systematic desensitization (covert self-modeling) are elaborated. (26 ref)—*Journal abstract*.
5923. Kifer, Robert E.; Lewis, Martha A.; Green, Donald R. & Phillips, Elery L. (U Kansas) **Training predelinquent youths and their parents to negotiate conflict situations.** *Journal of Applied Behavior Analysis*, 1974(Fal), Vol 7(3), 357-364.—In response to parental requests for assistance in dealing with their adolescent problem children, 3 parent-child pairs were taught negotiation responses to hypothetical conflict situations using behavior rehearsal and social reinforcement. The negotiation process was separated into component behaviors that were practiced during simulations by each youth and his parent under the direction of trainers. Results indicate that (a) the procedures were successful in training youths and their parents in negotiation behaviors that produced agreements to conflict situations and (b) these behaviors generalized to actual conflict situations in Ss' homes.—*Journal abstract*.
5924. Kostka, Marlon P. & Galassi, John P. (West Virginia U, Student Counseling Service) **Group systematic desensitization versus covert positive reinforcement in the reduction of test anxiety.** *Journal of Counseling Psychology*, 1974(Nov), Vol 21(6), 464-468.—Compared modified versions of systematic desensitization and covert positive reinforcement to a no-treatment control condition in the reduction of test anxiety in 27 undergraduates. Both experimental groups received 8 treatment sessions, and the systematic desensitization group received 2 additional sessions devoted to relaxation training. The 2 treatments were comparable and generally superior to the control group in pretest-posttest and pretest-follow-up changes as measured by the Suinn Test Anxiety Behavior Scale and the Alpert-Haber Achievement Anxiety Test. On an anagrams performance test, the covert reinforcement and control groups were superior to the desensitization group. No significant differences occurred in subjectively experienced anxiety during the performance test.—*Journal abstract*.
5925. Lassiter, Robert A. (Virginia Commonwealth U) **The use of group counseling in achieving adjustment to work.** In R. E. Hardy & J. G. Cull (Eds), *Group counseling and therapy techniques in special settings*. Springfield, IL: Charles C Thomas, 1974. ix, 166 p.—Provides a brief background of work adjustment and group counseling and presents a procedure for using group counseling methods in a work adjustment setting; this procedure is presented through an activity schedule that is offered as a guideline for helping handicapped people toward a better life through productive work. (19 ref)
5926. Lewis, Susan. (Vanderbilt U Hosp, Div of Child Psychiatry) **A comparison of behavior therapy techniques in the reduction of fearful avoidance behavior.** *Behavior Therapy*, 1974(Oct), Vol 5(5), 648-655.—Investigated the relative effectiveness of modeling, participation, and a combination of the 2 in reducing the avoidance behavior of 40 5-12 yr old male campers toward water activities. Measures included a pre- and postintervention behavior rating scale, a follow-up behavior rating scale, and an instructor's rating scale. The combination of modeling and participation was the most effective; however, modeling alone and participa-

tion alone, in contrast to a control condition, each significantly reduced avoidance behavior. Further, the participation component was more effective than the modeling component in inducing these behavioral changes.—*Journal abstract.*

5927. Lutzker, John R. (U of the Pacific) **Social reinforcement control of exhibitionism in a profoundly retarded adult.** *Mental Retardation*, 1974(Oct), Vol 12(5), 46-47.—Reports that exhibitionism was successfully treated in a 52-yr-old male by applying differential social reinforcement for other behavior.

5928. Mahoney, Kathryn. (Pennsylvania State U) **Count on it: A simple self-monitoring device.** *Behavior Therapy*, 1974(Oct), Vol 5(5), 701-703.—Describes an inexpensive and easily constructed wrist counter for self-monitoring. Its resemblance to contemporary handcrafted leather jewelry makes it less conspicuous than the more usual golf counter.

5929. Mahoney, Michael J.; Kazdin, Alan E. & Lesswing, Norman J. (Pennsylvania State U) **Behavior modification: Delusion or deliverance?** In C. M. Franks & G. T. Wilson (Eds), *Annual review of behavior therapy: Theory & practice: 1974*. New York, NY: Brunner/Mazel, 1974. xiv, 769 p. \$25.—Reviews the literature, surveying conceptual, empirical, and ethical arguments concerning behavior therapy and its applications. It is noted that, although behavior modification has no unified learning theory, there is no foundation to the contentions that the behavioral approach undermines choice, responsibility, and creativity, and there is no doubt about the efficacy of behavioral modification procedures. (7 p ref)

5930. Maletzky, Barry M. **Assisted covert sensitization for drug abuse.** *International Journal of the Addictions*, 1974, Vol 9(3), 411-429.—Describes a novel technique for the treatment of drug abuse in which a malodorous substance, valeric acid, is used to increase the covert sensitization process. Data from 20 16-43 yr old enlisted men who had abused a variety of drugs (e.g., alcohol, heroin, cigarettes, marijuana, and glue) show that this "assisted" covert sensitization procedure produced beneficial results not only in stopping overt drug use but also in reducing the frequency of thoughts and urges associated with the drug abuse. The practicality of this procedure is discussed, although it is emphasized that its use as an overall treatment of drug abuse awaits more definitive research and evaluation. (33 ref)

5933. Milosavljević, Peter. (Mental Health Inst, Belgrade, Yugoslavia) [Some aspects of work with psychiatric patients' families.] (Srce) *Anali Zavoda za Mentalno Zdravlje*, 1972, Vol 4(1), 19-25.

5934. Moreno, Zerkia T. (Moreno Inst, Beacon, NY) **Origins of the group psychotherapy movement.** *Handbook of International Sociometry*, 1973, Vol 7, 5-13.—Presents an overview of the history of the group psychotherapy movement, a creation of the 20th century. Key figures in the movement and their contributions are discussed, including T. Burrow, E. W. Lazell, L. C. Marsh, J. L. Moreno, and J. H. Pratt.

5935. Percell, Lawrence P.; Berwick, Peter T. & Beigel, Allan. (Adult Probation Dept, Redwood City, CA) **The effects of assertive training on self-concept and anxiety.** *Archives of General Psychiatry*, 1974(Oct), Vol 31(4), 502-504.—Administered the Lawrence Interpersonal Behavior Test (IBT), the Self-Acceptance scale of the California Psychological Inventory, and the Taylor Manifest Anxiety scale (TMAS) to 100 psychiatric outpatients (mean age = 29.4 yrs) to test the hypothesis that people who are assertive are also more self-accepting and less anxious. Results show a substantial positive relationship for both men and women between the IBT and the self-acceptance measure and a strong negative correlation for women only between the IBT and the TMAS. To test whether group assertive training would increase self-esteem and reduce general level of anxiety, as well as teach assertive skills, 24 patients were assigned to either an assertive training group or a relationship-control group for 8 sessions. Ss in the assertive training group showed significant increases in assertiveness (measured by the IBT), self-acceptance (measured by the Beger Self-Acceptance Scale), and significant decreases in anxiety (measured by the TMAS) relative to controls.—*Journal abstract.*

5936. Piecznik, Steven & Birk, Lee. (Harvard U, Medical School, Boston) **Behavior therapy of personality disorders.** In J. R. Lion (Ed), *Personality disorders: Diagnosis and management*. Baltimore, MD: Williams & Wilkins, 1974. xi, 432 p. \$21.—Reviews basic principles of behavior therapy and discusses the use of behavior modification and other techniques (e.g., emotional labeling, modeling, behavioral rehearsal, and role playing) in the inpatient treatment of character disorders. A specific case history is presented to illustrate these principles in the ward management and treatment of a severely disturbed patient. (36 ref)

5937. Ramirez, Luis & Ribes, Emilio. (Ctr de Modificación de Conducta B. F. Skinner, Bogotá, Colombia) **[Effects of punishment on multiple behaviors in a human subject.]** (Span) *Revista Latinoamericana de Psicología*, 1974, Vol 6(2), 161-178.—Studied punishment effects in a severely retarded child under a multiple-concurrent design, using 6 different responses in 2 successive stimulus situations. Differential reinforcement of other behavior and fixed interval reinforcement schedules were also used to evaluate interaction with

punishment. Results show that many of the assumptions about punishment are unjustified and that its effects are complex and dependent on multiple variables. (15 ref) —English summary.

5938. Ross, Steven M. (VA Hosp, Salt Lake City, UT) **Behavioral group therapy with alcohol abusers.** In R. E. Hardy & J. G. Cull (Eds), *Group counseling and therapy techniques in special settings*. Springfield, IL: Charles C Thomas, 1974. ix, 166 p.—Bases suggested techniques focusing group therapy in treating alcoholics on the assumption that alcohol abuse is a learned problem—patients learn to either escape or avoid unpleasant events or to gain access to pleasurable events through excessive drinking. Areas covered include techniques and terminology, pregroup preparations, and group meetings.

5939. Russell, Richard K. & Sipich, James F. (Michigan State U, Counseling Ctr) **Treatment of test anxiety by cue-controlled relaxation.** *Behavior Therapy*, 1974(Oct), Vol 5(5), 673-676.—Demonstrated the effectiveness of cue-controlled relaxation for an 18-yr-old female college student. Changes in self-report and performance measures in test taking were noted. The cue-controlled relaxation technique is described and its advantages over systematic desensitization discussed.

5940. Salhoot, Joyce T. (Baylor Coll of Medicine, Houston, TX) **The use of two group methods with severely disabled persons.** In R. E. Hardy & J. G. Cull (Eds), *Group counseling and therapy techniques in special settings*. Springfield, IL: Charles C Thomas, 1974. ix, 166 p.—Focuses on the unique aspects of using group methods with the severely disabled. Among the topics included are the purpose of the group, selection of members, concrete pregroup preparations, leadership, intake, group content and techniques, and the time-limited vs the open-ended group.

5941. Sank, Lawrence I. & Biglan, Anthony. (George Washington U, Medical Ctr) **Operant treatment of a case of recurrent abdominal pain in a 10-year-old boy.** *Behavior Therapy*, 1974(Oct), Vol 5(5), 677-681.—A token system was instituted with a male 10-yr-old which successfully decreased the reported level of abdominal pain, increased school attendance, and ended the occurrence of severe pain attacks. These new behaviors were maintained at a smooth and high rate of performance through a variable reinforcement schedule.

5942. Steinfeld, G. J.; Rautio, E. A.; Rice, A. H. & Egan, M. J. (Federal Correctional Inst, Narcotic Unit, Danbury, CT) **Group covert sensitization with narcotic addicts: Further comments.** *International Journal of the Addictions*, 1974, Vol 9(3), 447-464.—Describes the details of a group covert sensitization procedure for imprisoned narcotics addicts. Each of the sensitization tape recordings used in the 8 sessions are described, and sample responses from each of the 3 treatment groups (covert sensitization and therapeutic community membership, covert sensitization without therapeutic community, and no treatment) are discussed. Fears expressed by the Ss were categorized by sensory modality, discreteness of stimuli, and whether they were interpersonal, impersonal, or related to self-perceptions. Of the 8 participants, only 1 returned to drugs after release. The limitations of the present evaluation are examined, and

suggestions for further research on the content of the sensitization tapes are presented.—L. Gorsey.

5943. Sternberg, David & Cohen, Abraham. **Reciprocal sculpturing techniques for training ex-addict group leaders.** *Journal of Contemporary Psychotherapy*, 1974(Sum), Vol 6(2), 185-189.—Discusses the use of sculpturing as a training device in certain group situations which permits the tracing and subsequent working through of difficulties stemming from early relationships and experiences. This technique can lead to intricate transformations which occur as a function of the intrapsychic and transactional blending of old and new relationships. It is felt that the working-through state consists in understanding—often through the transference to each other—the introjects of the parents, so that each individual can experience how difficulties manifested in the present have emerged in their unconscious attempts to perpetuate or master old conflicts arising from early familial situations.—A. Farrell.

5944. Stevens-Long, Judith & Lovaas, O. Ivar. (California State U, Los Angeles) **Research and treatment with autistic children in a program of behavior therapy.** In A. Davids, *Child personality and psychopathology: Current topics: I*. New York, NY: John Wiley & Sons, 1974. ix, 239 p. \$13.95.

5945. Stierlin, Helm. (NIMH, Adult Psychiatry Branch, Bethesda, MD) **Family therapy: An introduction.** In A. Burton (Ed), *Operational theories of personality*. New York, NY: Brunner/Mazel, 1974. x, 421 p. \$15.—Describes family therapy as a new way of conceptualizing psychiatric problems as well as a new treatment form. The concepts of family homeostasis, family ego mass, transactional mode disturbances, and others are discussed. A detailed case history is presented to illustrate application of family theory.

5946. Tasto, Donald L. & Chesney, Margaret A. (Colorado State U) **Muscle relaxation treatment for primary dysmenorrhea.** *Behavior Therapy*, 1974(Oct), Vol 5(5), 668-672.—Treated 7 female students by a combination of muscle relaxation and imagery associated with menstrual pain reduction. Significant differences between pre- and posttreatment measures were all in the expected direction.

5947. Thurrell, Richard J. & Marshall, John R. (U Wisconsin, Medical School, Madison) **Difficulties in implementation of behavior therapies in a mixed or eclectic clinical situation.** *Journal of Nervous & Mental Disease*, 1974(Sep), Vol 159(3), 158-163.—Considers that the behavior therapy movement brings a renewed empiricism to psychiatry with its emphasis on practicality and precision. Application of specific behavioral techniques engenders difficulties that occur with some regularity: (a) a constricted view of treatment indications, (b) tendencies either to quit too soon or to persist too long, (c) the glib use of pseudobehavioral jargon, (d) a miring in loyalty struggles and pseudoethical issues, (e) overzealous or apologetic application, and (f) casual experimentation. Remedy of these problems begins with reappraisal in terms of general behavioral principles rather than rote applications of techniques. (15 ref) —Journal abstract.

5948. Toepfer, Caroline T.; Bicknell, Ann T. & Shaw, David O. (Inst for Behavior Modification, New Wilming-

ton, PA) **Remotivation as behavior therapy.** *Gerontologist*, 1974(Oct), Vol 14(5, Pt 1), 451-453.—Emphasizes similarities between remotivation and behavioral therapies. It is suggested that remotivation be made more systematic by specifying operationally desired behaviors, obtaining direct quantitative measures of patients' responses, and focusing upon differential reinforcement of goal behaviors for each patient.

5949. Tracey, Dorothy A.; Briddell, Dan W. & Wilson, G. Terence. (Rutgers State U, Psychological Clinic, New Brunswick) **Generalization of verbal conditioning to verbal and nonverbal behavior: Group therapy with chronic psychiatric patients.** *Journal of Applied Behavior Analysis*, 1974(Fal), Vol 7(3), 391-402.—12 chronic psychotic hospitalized female patients received token reinforcement contingent on 2 separate classes of verbalizations: (a) positive statements about optional activities available in the hospital setting and (b) positive statements about people. Cross-class generalization of reinforced verbal responses about activities to overt behavior was tested by actual participation in activities; within-class generalization of verbal responses about people to verbalizations in another stimulus setting was assessed in a structured interview situation. A multiple baseline design with contingency reversals was employed to demonstrate experimental control of both classes of verbalizations in the group sessions. Positive statements about activities generalized to actual participation in activities, while generalization of the positive statements about people to verbalization in the extra-group setting did not occur. (19 ref)—*Journal abstract*.

5950. Watson, Luke S. & Bassinger, Joan F. (Illinois Dept of Mental Health, Chicago) **Parent training technology: A potential service delivery system.** *Mental Retardation*, 1974(Oct), Vol 12(5), 3-10.—Describes the Parent Training Technology System (PTTS), an operant-type behavior modification system that utilizes parents as behavior modification technicians. The program has been used to eliminate undesirable behavior and to teach self-help, language, motor coordination, social-recreational, and academic skills to mildly, moderately, severely, and profoundly retarded children, as well as psychotic and "emotionally disturbed" children. It is suggested that because parents, siblings, peers, and teachers are involved in the program, and training takes place in the child's natural environment, many stimulus control problems inherent in more traditional intervention clinical strategies are avoided. (27 ref)—*Journal abstract*.

5951. Wilson, Earl D. (U Nebraska, Counseling Psychology Program) **Patient programming toward self control in the psychiatric hospital setting.** *Corrective & Social Psychiatry & Journal of Behavior Technology Methods & Therapy*, 1974(Sum), Vol 20(3), 21-24.—Unmanageable psychiatric patients are typically handled in 1 of 3 ways or in a combination of them: increased medication; isolation and/or restraints; and increased attention and supervision by staff. This study evaluated the effectiveness of a combined technique in bringing the behavior of 1 female S from an uncontrolled state (requiring restraint) to a stage of self-management which ended the need for forced control and facilitated the completion of special activities. The technique involved

positive reinforcement of the desired response and punishment of inappropriate responses. Differential reinforcement successfully controlled the patient's work and social behavior, and control was achieved in a very short time. A sufficient measure of self-regulation was achieved to allow the S to leave the hospital and become gainfully employed; however, this result cannot be directly attributed to the use of the described methodology. The relative effects of punishment and positive reinforcement as separate conditions contributing to patient control cannot be adequately evaluated from this study. Various attitudinal and behavioral changes in the staff were necessary to manage this program.—*J. Sorokac*.

5952. Wollersheim, Janet P. **Cognitive desensitization: Explication of a new technique via a case report.** *Journal of Contemporary Psychotherapy*, 1974(Sum), Vol 6(2), 146-153.—Discusses the advantages of cognitive desensitization (CD) in a variety of situations. A case history is presented of a 19-yr-old university sophomore who sought help because of extreme fear of flunking. CD helped to desensitize the stimulus situation and alleviated the anxiety inherent in the process of attitude and behavioral change. This approach is considered to have certain advantages over both ordinary desensitization and the more typical cognitive therapeutic techniques. It is concluded that CD may be the treatment of choice for certain problems associated with high anxiety.—*A. Farrell*.

5953. Young, James A. & Wincze, John P. (Dalhousie U, Halifax, Nova Scotia, Canada) **The effects of the reinforcement of compatible and incompatible alternative behaviors on the self-injurious and related behaviors of a profoundly retarded female adult.** *Behavior Therapy*, 1974(Oct), Vol 5(5), 614-623.—Used a multiple-baseline, within-S design with a 21-yr-old retarded girl in which the reinforcement of a physically compatible target behavior (eye contact with the E) resulted in a systematic increase in this behavior but no decrease in self-injurious behaviors. The reinforcement of a physically incompatible target behavior (sitting erect with hands lowered) also resulted in its increase over baseline level. Under this condition, one class of self-injurious behavior increased in frequency while another class decreased. Data indicate that the mere presence of any particular alternative behavior that is effective in obtaining reinforcement is not sufficient in itself to reduce self-injurious behavior. During a final phase of this study, response contingent shock was introduced. This procedure was effective in suppressing the class of self-injurious behavior to which it was applied. Self-injurious behavior which was not punished continued at baseline level.—*Journal abstract*.

5954. Zupnick, Stanley M. (St Vincent Hosp & Medical Ctr, Toledo, OH) **A new approach to disturbed children: The medical college school program.** *Psychiatric Quarterly*, 1974, Vol 48(1), 74-85.—Describes a treatment-oriented day-school program for emotionally disturbed children, structured according to the principles of behavioral theory. The daily routine, types of children served, and results are discussed. The program works with the parents also, using traditional psychotherapeutic principles while concurrently teaching them the use of

behavioral techniques for the home. A case example illustrating the principles and procedures of the program and a discussion of its future directions are included.—*Journal abstract.*

### Psychoanalysis

5955. Appel, Gerald. An approach to the treatment of schizoid phenomena. *Psychoanalytic Review*, 1974(Spr), Vol 61(1), 99-113.—Describes the schizoid personality as an individual oscillating between simultaneously clinging to objects and expelling them, fleeing those who would love him and yet being unable to renounce external objects altogether. Theoretical constructs are compared, favoring a model of an ego threatened on all sides in an unresponsive universe. The schizoid experience develops early in life as a result of disturbed primary parent-child relationships, which lead the infant to turn in on itself for safety into fantasy and withdrawal. Therapy involves the provision of a reconstructive object-relationship experience which helps the patient reverse the withdrawal process and experience his own self and ego.—*B. Smith.*

5956. Binstock, William A. Purgation through pity and terror. *International Journal of Psycho-Analysis*, 1973, Vol 54(4), 499-504.—Analyzes the "metaphor of constipation" and various modes of catharsis, from Aristotle's doctrine of esthetic purgation to the latest self-expressive movements in psychotherapy. It is argued that human emotions are not foreign substances to be expelled for reasons of self-improvement, notwithstanding Freud's original formulation of therapy as a cleansing process. (15 ref)—*C. T. Sullivan.*

5957. Bradlow, Paul A. Depersonalization, ego splitting, non-human fantasy and shame. *International Journal of Psycho-Analysis*, 1973, Vol 54(4), 487-492.—Uses material from 4 psychoanalytic case histories to illustrate the view that predisposing factors such as discrepancies between the ego and ego-ideal lead to splitting of the ego, with some part (usually the "bad or evil self") being rejected. The resulting nonhuman fantasies and feelings of depersonalization, at least in acute episodes, may be related psychodynamically to experiences of shame. (18 ref)—*C. T. Sullivan.*

5958. Brandt, Lewis W. (U Saskatchewan, Canada) Experiments in psychoanalysis. *Psychoanalytic Review*, 1974(Spr), Vol 61(1), 95-98.—Describes a case study which tested the hypothesis that an analysand who resists change by enslavement to an onerous ego ideal will give up part of his resistance if the analyst fulfills the patient's recommendations as to how he should be treated. Reduction of resistance was confirmed by the patient recalling memories and by openness to interpretation. The interventions of the treatment process are seen as experimental paradigms where an independent variable is manipulated and in which the dependent variable stipulated by the hypothesis occurs.—*B. Smith.*

5959. Eberenz, Udo. [The human image in psychoanalysis.] (Germ) *Heilpädagogik*, 1973(Dec), Vol 42(4), 342-349.—Discusses Habermas's critique of psychoanalysis, especially his idea of the misunderstanding of psychoanalysis by scientists. An attempt is made to formulate the method, subject matter, and purpose of psychoanalysis, and to describe the interplay of psychoanalytic theory and practice. Reference is made to Freud's

great desire for scientific comprehension, and his wish to help liberate man from irrational compulsions and dependence. The socialization theory of psychoanalysis is outlined; according to this theory, disordered object relationships in childhood, and the resulting conflicts, are responsible for irrational solutions to conflict. The psychoanalytic theory of illness is discussed, with special emphasis on the concept that actual suffering, subjectively experienced, can be diminished only through comprehension of the significance of one's earlier life. (French summary) (18 ref)—*C. Bauer.*

5960. Eigen, Michael. Abstinence and the schizoid ego. *International Journal of Psycho-Analysis*, 1973, Vol 54(4), 493-498.—Discusses cases in which psychoanalytic patients spontaneously underwent periods of isolation and abstinence for the sake of their personal development. Such experiences can be conceptualized in terms of the rediscovery of a powerful, unintegrated structure which resembles H. Elkin's (see PA, Vol 59:8555) "schizoid ego" rather than H. Guntrip's (see PA, Vol 43:14551) "true self."—*C. T. Sullivan.*

5961. Etchegoyen, R. H. A note on ideology and psychoanalytic technique. *International Journal of Psycho-Analysis*, 1973, Vol 54(4), 485-486.—Points out that in some cases the psychoanalyst actually imposes an ideology on the patient, but that in other cases, through projective identification, the patient falsely attributes some of his conflicting views to the analyst. This form of resistance poses technical problems which are briefly discussed.

5962. Feldman, Harold. A psychoanalytic addition to human nature. *Psychoanalytic Review*, 1974(Spr), Vol 61(1), 133-139.—Proposes that psychoanalysis adds a new type of thought to the patient's life—control by associative samplings of feeling, the union of affect and ideas in the service of rational decision.

5963. Meadow, Phyllis W. (Manhattan Ctr for Advanced Studies, NY) A research method for investigating the effectiveness of psychoanalytic techniques. *Psychoanalytic Review*, 1974(Spr), Vol 61(1), 79-94.—Compared the verbal behavior with which 20 psychoanalytic patients responded to 2 classes of intervention—interpretation, and contact functioning or mirroring of transference resistance. Classical interpretation included the insight-furthering techniques of confrontation, clarification, interpretation of the past, and working through. Contact functioning used the ego-insulating techniques of echoing the ego and devaluating the object. 4 transference-resistance responses were investigated: projection of self-hatred, turning anger against the self, projection of absence of positive affect, and threats of acting out. 2 psychoanalyst judges rated the patients' tape-recorded transcripts on 3 scales to show the range of inhibition or lack of inhibition in expressing feeling, detailing of history, and presence of insight. Greater change was found when the analyst reflected the patient's mode of defense than when he interpreted it. (27 ref)—*B. Smith.*

5964. Ornstein, Paul H. & Goldberg, Arnold. (U Cincinnati, Medical School) Psychoanalysis and medicine: I. Contributions to psychiatry, psychosomatic medicine and medical psychology. *Diseases of the Nervous System*, 1973(Apr), Vol 34(4), 143-147.—Con-

siders the areas of medicine in which psychoanalysis has had an impact as (a) a treatment process, (b) a theory of the mind and a body of knowledge about human development, and (c) a method of research into the personality and its aberrations. The impact of Freudian concepts of the unconscious, transference, and early infantile and childhood development on psychiatry and psychotherapy is discussed. The contribution of psychoanalysis as a method of research has led to knowledge about the etiology, pathogenesis, and curative processes of mental illness. Psychoanalysis as a theory and technique is also closely linked to the entire field of psychosomatic medicine, and has contributed to the formation of medical psychology, which considers such issues as the emotional climate in which illness can attain a remission or cure. However, it is suggested that medical psychology has not been assimilated into general medical practice because psychoanalysts have failed to translate their knowledge into effective and communicable therapeutic measures applicable to the medical field.—A. Olson.

5965. Robinson, Lillian H. (Tulane U, Medical School) **Sleep and dreams in the analytic hour: The analysis of an obsessional patient.** *Psychoanalytic Review*, 1974(Spr), Vol 61(1), 115-131.—Discusses the functions of sleep during analysis, using the case of an obsessional patient to illustrate the theory. Sleep is seen to serve multiple purposes: to be a defense against instinctual impulses as well as their symbolic gratification, to be a resistance to analysis and an escape from and submission to wishes to be dependent on the analyst. By interpreting and understanding the meaning of each episode, the sleep behavior can expedite analysis by facilitating the patient's acceptance of his inner striving and by increasing his ability to relinquish his defense of excessive control.—B. Smith.

5966. Saperstein, Jerome L. & Gaines, Jack. **Metapsychological considerations on the self.** *International Journal of Psycho-Analysis*, 1973, Vol 54(4), 415-424.—Discusses a basic dichotomy between metapsychological theory and clinical practice in psychoanalysis. The former uses "ego" and related concepts to deal with individual functioning from an objective standpoint, but the latter needs a different concept, such as the "supraordinate self," to reflect the subjective, experiential aspects of the "self-as-agent" in decision-making and other purposeful, meaningful activities. It is hoped that this conceptual innovation will help to bring theory and practice into closer agreement. (29 ref)—C. T. Sullivan.

5967. Shafii, Mohammad. (U Michigan, Medical Ctr, Children's Psychiatric Hosp) **Silence in the service of ego: Psychoanalytic study of meditation.** *International Journal of Psycho-Analysis*, 1973, Vol 54(4), 431-443.—Describes the beneficial effects of meditative silence, in contrast to the usual psychoanalytic position that silence indicates a defensive lack of verbalization on the patient's part. (37 ref)

5968. Strean, Herbert S. (Rutgers State U, Graduate School of Social Work, New Brunswick) **Psychoanalytically-oriented casework versus behavior modification therapy.** *Clinical Social Work Journal*, 1973(Fal), Vol 1(3), 143-160.—Illustrates the usefulness of both forms of treatment, and points out the disadvantages of

accepting one form to the exclusion of the other. The importance of tailoring treatment modalities to the needs of the client is stressed.

5969. Weiner, Herman. **Toward a body therapy.** *Psychoanalytic Review*, 1974(Spr), Vol 61(1), 45-52.—Reevaluates and upholds the view of catharsis as a therapeutic modality to integrate body-mind. Insight based on insufficiently relived experiences is considered inadequate, because repressed memories were never rightfully lived in the first place. The functions of the nondominant cortical hemisphere are noted in terms of body-mind integration.

### Counseling & Community Mental Health & Crisis Intervention

5970. ———. **A community treatment program: Mendota Mental Health Institute, Madison, Wisconsin.** *Hospital & Community Psychiatry*, 1974(Oct), Vol 25(10), 669-672.—Describes an intensive treatment program, called Training in Community Living, in which mental patients live and work in the community with support from a specially trained staff. Patients remain in the program for 14 mo and are gradually linked with appropriate community services.

5971. ———. **A plan for minimizing psychiatric casualties in a disaster: Columbia Area Mental Health Center, Columbia, South Carolina.** *Hospital & Community Psychiatry*, 1974(Oct), Vol 25(10), 665-668.—Details a plan which calls for the center to operate as an information and communications center on disaster casualties, to provide a site for reuniting families and a haven for uninjured survivors, and to give immediate counseling or treatment to those in distress or shock.

5972. Birger, Daniel; Plutchik, Robert & Conte, Hope R. (Albert Einstein Coll of Medicine, Yeshiva U) **The evolution and demise of a crisis intervention program in a state hospital.** *Hospital & Community Psychiatry*, 1974(Oct), Vol 25(10), 675-677.—A crisis intervention team at a state hospital offered professional services to approximately 27 patients before it was disbanded after 6 mo of operation. The evolution of the team and the conflicts that led to its demise are described, and the experience is evaluated.

5973. Caplan, Harvey W. & Black, Rebecca A. **Unrealistic sexual expectations.** *Medical Aspects of Human Sexuality*, 1974(Aug), Vol 8(8), 8-36.—Considers that most sexual problems are centered around unrealistic expectations, particularly distorted conceptions about orgasm. Problems involving performance anxiety, sexual responsiveness, and frequency of intercourse are examined, and case examples are included. It is suggested that the dichotomy between and the unquestioning acceptance of concepts of masculinity and femininity in contemporary society may often reinforce distorted and incorrect ideas about sexual behaviors. Suggestions for counseling patients are presented.—L. Gorsey.

5974. Crum, Roger S. (Lutheran Welfare Services of Illinois, Presbyterian—St Luke's Hosp, Chicago) **Counseling rape victims.** *Journal of Pastoral Care*, 1974(Jun), Vol 28(2), 112-121.—An emergency room chaplain presents a case verbatim of counseling a rape victim. Counseling focused first on the patient's need for help in managing the psychological, social, and legal issues

raised by the family and the police, and then on her need for recall of the trauma and private reflection on it.

5975. Cull, John G. & Hardy, Richard E. (Eds.). (Virginia Commonwealth U) **Deciding on divorce: Personal and family considerations.** Springfield, IL: Charles C Thomas, 1974. xiii, 158 p.

5976. Davis, Ann E.; Dinitz, Simon & Pasamanick, Benjamin. (Miami U) **Schizophrenics in the new custodial community: Five years after the experiment.** Columbus, OH: Ohio State University Press, 1974. xxviii, 214 p.—Presents findings and case histories from a long-term study of social, familial, and vocational adaptive behavior patterns in schizophrenics after hospital release, emphasizing the success of various treatment procedures, the social factors that contribute to psychotic episodes, and the patients' ability to make satisfactory personal and vocational community adjustments. Suggestions for treatment of schizophrenics and community programs are also presented. (13 p ref)

5977. Daylong, William B. (First Baptist Church, Reedsburg, WI) **Beyond the wall of silence: Pastoral care of the stroke patient.** *Journal of Pastoral Care*, 1974(Jun), Vol 28(2), 122-133.—Describes and discusses the difficulties faced by stroke patients and the use of pastoral conversation as a rehabilitative tool. The results of a stroke leave the patient with traumatic knowledge of his illness, physical disabilities, and mental disabilities due to brain damage. The emotional reactions to these deficits are fear, anger, depression, and feelings of isolation and loneliness. A commonly perceived interpretation of the stroke experience is a conviction of sin. The pastor can help the patient give positive meanings to his experience. He can provide knowledge of the illness and its effects, a relationship that helps the patient reestablish his place in his environment, a creative approach to rehabilitation, and a supportive church community.—B. Smith.

5978. Dibner, Susan S. **Newspaper advice columns as a mental health resource.** *Community Mental Health Journal*, 1974(Sum), Vol 10(2), 147-155.—Reports results of a study of 100 letters sent to 2 newspaper advice columns in 1958-1968. Findings indicate that people using this source of help blamed others for their problems and did not see themselves as needing to change. Besides being seen as a place to get advice, newspaper columns were used to obtain specific and general psychological information or to express an opinion. Findings are compared to those concerning other community sources of help. It is suggested that advice columns may appeal to people who would not go elsewhere as well as those in the process of finding a more "professionally trained" practitioner.—*Journal abstract.*

5979. Everett, Henry C. (Harvard U, Medical School, Boston) **Sexual demands which cause marital conflict.** *Medical Aspects of Human Sexuality*, 1974(Sep), Vol 8(9), 113-114.—Presents counseling suggestions for dealing with sexually incompatible couples, including the necessity of distinguishing between qualitative and quantitative demands of one partner, the importance of talking with the partners both individually and jointly, the need to create an objective and reassuring atmosphere, and

the importance of facilitating open and honest communication between the partners.

5980. Gadpaille, W. J. **Masturbation in preadolescent girls.** *Medical Aspects of Human Sexuality*, 1974(Sep), Vol 8(9), 179-180.—Presents suggestions for family physicians and pediatricians in assessing the problem of preadolescent girls' masturbation. 2 major factors in counseling are identified: the parents' feelings and attitudes, and the girl's age and level of maturation. Methods of evaluating the child's motivations, handling the problem of compulsive masturbation, and reassuring parents about the normality of masturbation are briefly considered.

5981. Galin, Richard S. (Brentwood VA Hosp, Los Angeles, CA) **A modular, community-oriented treatment program: For the chronic incapacitated psychotic patient with severe residual psychosocial impairment.** *Psychiatric Quarterly*, 1974, Vol 48(1), 26-49.—Outlines current deficiencies of hospital-based treatment programs for chronic psychotic patients. The specific structure and organization of a new and innovative program is described in which the basic elements are interpersonal and resocialization emphasis, a thoroughly humanistic and therapeutic milieu, individualized and psychosocially based treatment of a 3-stage and 2-setting design, an implemented continuity of care principle extended into the community satellite aftercare center and outpatient phases of treatment, expanded and enriched roles and team approach of staff, and considerable flexibility. 6 suggestions are offered for research and evaluation which might demonstrate wide applicability of the program. (34 ref)—*Journal abstract.*

5982. Gass, Gertrude Z. (Grosse Pointe Farms, MI) **Equitable marriage.** *Family Coordinator*, 1974(Oct), Vol 23(4), 369-372.—Considers that counselors and psychotherapists must increasingly concern themselves with changing role relationships in marriage. Attempts to establish an equity in marriage have received little attention in professional journals. These shifts need careful study by clinicians so that couples may be supplied with options that lead to self-realization and fulfillment for both partners.—*Journal abstract.*

5983. Hackney, Harold. (Purdue U) **Applying behavior contracts to chronic problems.** *School Counselor*, 1974(Sep), Vol 22(1), 23-30.—Describes the behavior contract as a formal agreement between the client and others who affect or are affected by the client's behavior. The objectives of this contract are to obtain a commitment to change, to effect the change, and to agree in advance what the consequences of the change will mean for all involved. Critical elements of behavioral contracts—identifying observable target behaviors, recording observed behaviors, establishing performance criteria, defining reinforcement schedule, and determining a time within which behavioral change is to occur—are discussed and illustrated by an example. Behavioral contract emphasizes structure, clarifies roles and responsibility, and identifies alternative behaviors and their consequences.—A. S. Helge.

5984. Hagin, Rosa A. & Corwin, Carol G. (New York U, Medical Ctr, Learning Disorders Unit) **Bereaved children.** *Journal of Clinical Child Psychology*, 1974(Sum), Vol 3(2), 39-40.—Examines the mental

health consequences to the child of parental death, and the development of his inner concept of death. Helping the bereaved child involves preventing distorted grief responses and encouraging the normal processes of mourning. Both parents and surviving siblings need assistance when it is a child that dies. Effective intervention in the mourning process is necessary to help children deal with grief through their own life experiences and in terms of the culture in which they live.—A. Krichev.

5985. Harper, Frederick D. & Stone, Winifred O. (Howard U) **Toward a theory of transcendent counseling with blacks.** *Journal of Non-White Concerns in Personnel & Guidance*, 1974(Jul), Vol 2(4), 191-196.—Presents a 10-point theory that is suggested as a framework for counseling black Americans as a distinct cultural and ethnic group. The importance of the counselor's orientation or outlook regarding blacks and of his choice of counseling techniques is emphasized. Based on the belief that black students often need immediate results to problems, a counseling technique that is supportive, directive, and informative or one which employs acceptance, advising, approval, persuasion, assurance, and probing techniques is suggested.—M. E. Pounsel.

5986. Hawkins, David R. (U Virginia, Medical School) **Disturbing erotic fantasies.** *Medical Aspects of Human Sexuality*, 1974(Sep), Vol 8(9), 177-178.—Presents suggestions for the nonpsychiatric physician in treating the patient who presents erotic fantasies, emphasizing that it is crucial to understand the nature, origins, and purposes of the fantasy that is disturbing. 5 factors which are important in history taking and counseling are presented, and underlying themes of some fantasies are noted.

5987. Helner, Philip A. & Jessell, John C. (Southfield Public Schools, MI) **Effects of interpretation as a counseling technique.** *Journal of Counseling Psychology*, 1974(Nov), Vol 21(6), 475-481.—Through the use of videotaped, simulated counseling situations, the reactions of 50 4th-grade, 10 10th-grade, and 50 graduate school males toward the technique of interpretation were examined. The feelings of Ss toward interpretation were compared with their feelings toward the techniques of reflection, advice giving, and probing. A significant number of Ss of each educational level expressed negative feelings toward the use of interpretation. Implications of the use of interpretation in counseling are discussed. (17 ref)—*Journal abstract*.

5988. Hetznecker, William & Forman, Marc A. (Temple U, Health Sciences Ctr) **On behalf of children.** New York, NY: Grune & Stratton, 1974. xviii, 232 p.—Presents an account of the authors' experiences in child mental health programs, emphasizing problems and procedures involved in the development of clinical services, consultation, and new manpower resources. Topics include the transformation of a traditional child guidance clinic into a community psychiatric clinic, problems in school consultation, and evaluations of parent education and mental health assistant programs.

5989. Isquith, Robert N. **Health-related audiovisual aids for Spanish-speaking audiences.** *Health Service Reports*, 1974(Mar), Vol 89(2), 188-202.—Provides an annotated list, with prices and distributors of films, TV

spots, filmstrips, and slides, which appear in a book distributed without charge by the Health Services Administration of the US Public Health Service.

5990. Kety, Seymour S. (Harvard U, Medical School, Boston) **Research still holds the answer.** *MH*, 1974(Win), Vol 58(1), 6-8.—Federal and state governments and private foundations are responding to the waning of public enthusiasm by cutting psychiatric research funds and turning to other problems. It is argued that mental health research is still the most practical and efficient way to utilize our scientific and financial resources for greatest social benefits.

5991. Kroeker, L. L. (U Rochester, Counseling & Special Services) **Pretesting as a confounding variable in evaluating an encounter group.** *Journal of Counseling Psychology*, 1974(Nov), Vol 21(6), 548-552.—Evaluated the effectiveness of an encounter group designed to enhance relationships between 3 groups of 68 15-21 yr old black inner-city males and 3 groups of 38 white and 2 black policemen and the interaction between pretesting and treatment and its effects on outcome. There were 3 experimental and 3 control groups which either did or did not participate in the pretest and treatment portions of the study; all groups completed the posttest. The 2 evaluation measures were the Alienation Index Inventory and a specially developed projective device; these were administered by white and black Es to same-race groups. Results indicate that the proportion of variance contributed by pretesting is influenced by group membership, treatment, and outcome criterion and is largely unpredictable. It is suggested that such variance be controlled in each experiment. (16 ref)—L. Gorsey.

5992. Lassiter, Robert A. (Virginia Commonwealth U, School of Community Services) **Group counseling with people who are mentally handicapped.** In R. E. Hardy & J. G. Cull (Eds), *Group counseling and therapy techniques in special settings*. Springfield, IL: Charles C Thomas, 1974. ix, 166 p.—Discusses issues surrounding the use of group counseling as a means of treating the mentally handicapped client. These include a review of the literature, a rationale for the role of the worker as a group counseling leader, and general guidelines for establishing a systematic pattern for counseling individuals with various mentally handicapping conditions.

5993. Lee, Soong H.; Gianturco, Daniel T. & Eisdorfer, Carl. (Duke U, Medical School) **Community mental health center accessibility: A survey of the rural poor.** *Archives of General Psychiatry*, 1974(Sep), Vol 31(3), 335-339.—Surveyed 223 households, including 70% from low social classes, about community and personal problems and where they seek help for these problems. There was a high prevalence of "mental health problems," yet a majority of the persons affected sought no help. Very few people considered the mental health center as a resource, and local physicians were the overwhelming choice for those who would seek help. A large percentage of lower-class people did know the purpose of the clinic but saw mental health problems in a pejorative fashion. Fear of being identified as mentally ill was an effective barrier to seeking services. Findings suggest that long-term community education, indigenous workers, and back-up services to local physicians would

facilitate mental health service to the community.  
—*Journal abstract.*

5994. **Lemere, Frederick.** (U Washington, Medical School) **The sexless marriage—necessarily a problem?** *Medical Aspects of Human Sexuality*, 1974(Sep), Vol 8(9), 81-82.—Presents suggestions for counseling each partner involved in a sexless marriage, emphasizing that this may not be a problem when there is deep and abiding affection based on a mutual respect. Recommendations for evaluating the potential for corrective therapy and what to counsel when the marriage will remain sexless are also noted.

5995. **Lester, David.** (Richard Stockton State Coll) **Effect of suicide prevention centers on suicide rates in the United States.** *Health Service Reports*, 1974(Jan-Feb), Vol 89(1), 37-39.—Compared suicide rates in 8 cities which had established prevention centers by 1967, 8 which had centers by 1969, and 8 cities without centers. Data on suicides in 1960 and 1969 were studied. It is concluded that suicide prevention centers do not appear to have a statistically significant effect on the suicide rate of cities.

5996. **Lilleskov, Roy K.** (Jewish Board of Guardians, Child Development Ctr, New York, NY) **Experiences with early intervention.** *Psychosocial Process*, 1974(Spr), Vol 3(1), 14-27.—Describes several kinds of problems encountered in a day care program for children under 3 yrs old from a high risk population (disorganized, multiple-problem families of the lower lower class). 3 cases are presented: Andy, an 18-mo-old boy who was withdrawn and showed retarded social and speech skills; Betty, an 18-mo-old girl who was inactive, could not walk, and was unable to manipulate objects; and Dora, a normal child. It is concluded that (a) day care can serve as a basis for many types of intervention, (b) day care can supplement the maternal function, and (c) in many cases a clinical assessment is needed to work with parents.—*J. M. Kleinman.*

5997. **Luckey, Robert E. & Shapiro, Ira G.** **Recreation: An essential aspect of habitation programming.** *Mental Retardation*, 1974(Oct), Vol 12(5), 33-35.—Discusses the importance of recreation to the total system of habilitative services for mentally retarded persons in terms of previous and current trends in the field. The role of the parent-volunteer movement, and recent developments which suggest that the full normalizing potential of recreational programming may be achieved in the future, are also discussed.—*Journal abstract.*

5998. **Marcotte, David et al.** (Medical U, South Carolina) **What sexual literature do you advise patients to read?** *Medical Aspects of Human Sexuality*, 1974(Aug), Vol 8(8), 66-85.—Presents recommendations of 5 psychiatrists and gynecologists for books and journals that persons seeking sexual counseling and/or treatment should read. Books for several age groups are included, and suggestions for concurrent counseling are presented.

5999. **Mazade, Noel A.** (U North Carolina, Medical School, Chapel Hill) **Consultation and education practice and organizational structure in ten community mental health centers.** *Hospital & Community Psychiatry*, 1974(Oct), Vol 25(10), 673-675.—45 staff members involved in consultation and education rated the organizational flexibility of their centers and indicated

the time they spent in each of 8 types of activities. Resulting data suggest that the research model is of value in studying the nature and direction of mental health center programming.

6000. **Paykel, Eugene S. et al.** (St George's Hosp, London, England) **Treatment of suicide attempters: A descriptive study.** *Archives of General Psychiatry*, 1974(Oct), Vol 31(4), 487-491.—Examined treatment patterns and their determinants in 274 suicide attempters coming to an emergency room. Only a small proportion (9.1%) required medical hospitalization. 44% were admitted to psychiatric hospitals and 38% referred for outpatient treatment. On follow-up of a sample of outpatient referrals, only half came for their 1st appointment. Comparisons of treatment groups (on the Los Angeles Suicide Prevention Center Assessment of Suicidal Potentiality and the Hamilton Rating Scale for Depression) indicated that the decision to hospitalize was independent of social factors but was strongly related to relevant clinical criteria reflecting severity and suicidal risk. Choice of facility for hospitalization was related to some nonclinical factors. Reasons for outpatient nonattendance were less clear, and its reduction presents a major therapeutic challenge. (16 ref)—*Journal abstract.*

6001. **Reiner, Beatrice S. & Edwards, Raymond L.** (Juvenile Welfare Board of Pinellas County, FL) **Adolescent marriage: Social or therapeutic problem?** *Family Coordinator*, 1974(Oct), Vol 23(4), 383-390.—Presents a study of 50 marriage counseling cases where both partners were under 20 yrs of age at the time of marriage. It is concluded that the vulnerability of early marriages due to inexperience, lack of preparation, unconsolidated identities, and problems carried over from families of origin is greatly increased by the failure of communities to provide the basic economic and human supports formerly offered by family networks. Suggested methods for identifying the social needs of these couples, for designing preventive education programs, and for counseling are noted.—*Journal abstract.*

6002. **Schnell, Richard.** (Children's Hosp Medical Ctr, Developmental Evaluation Clinic, Boston, MA) **Helping parents cope with the dying child with a genetic disorder.** *Journal of Clinical Child Psychology*, 1974(Sum), Vol 3(2), 34-35.—Suggests that tact, sensitivity, perceptiveness, and good taste are necessary when informing parents of a diagnosis of a fatal disease in their child. The presence of at least 2 people in the discussion with the parents is helpful. Further counseling of parents should be directed toward the child's rights and needs and should emphasize the rewards to be obtained as well as the parents' own need to give to the child. Informing the child and helping him are equally important.—*A. Krichev.*

6003. **Schooley, Christopher C.** (Louisville Presbyterian Theological Seminary, KY) **Communicating with hospitalized children: The mutual storytelling technique.** *Journal of Pastoral Care*, 1974(Jun), Vol 28(2), 102-111.—Suggests that through the mutual story telling technique, in which hospitalized child and pastor exchange stories, support, hope, and healing can be encouraged by the pastor. At the same time, the child

can be encouraged to express despair, anger, and anxiety.

6004. Smith, Mary L. (U Colorado, School of Education) **Influence of client sex and ethnic group on counselor judgments.** *Journal of Counseling Psychology*, 1974(Nov), Vol 21(6), 516-521.—Asked 198 secondary school counselors to predict the academic success and choose an appropriate career for 4 hypothetical cases in which the sex and ethnic group designation were varied systematically. Results show that variation in sex and ethnic group designation did not produce variations in counselor evaluations. Counselor sex was not related to systematic variance in evaluations. Several reliable sources of variability were identified, including the target situation the client was projected into and counselor response style. (17 ref)—*Journal abstract*.

6005. Sternlicht, Manny & Sullivan, Ina. (Willowbrook Developmental Ctr, Queens Unit, Staten Island, NY) **Group counseling with parents of the MR: Leadership selection and functioning.** *Mental Retardation*, 1974(Oct), Vol 12(5), 11-13.—Describes the various roles and functions of the leader of a parents group, and argues for a maximum of flexibility in accordance with the aims and objectives of the particular group. The concept of several leaders is explored, and the objectives of diverse types of groups discussed.—*Journal abstract*.

6006. Tavormina, Joseph B. (U Virginia) **Basic models of parent counseling: A critical review.** *Psychological Bulletin*, 1974(Nov), Vol 81(11), 827-835.—Defines the structure of parent counseling procedures, which represent a new trend in therapeutic strategy for behavior problems in children. Research evidence on the effectiveness of 2 basic counseling models—the behavioral and the reflective—is evaluated. Included are analyses of design, methodology, and outcome derived from each method. Overall, both strategies have been reported as successful with a variety of problem behaviors and divergent populations. However, exploration of the relative effectiveness of these models through comparative cost efficiency studies with specific problems and specific types of children is needed to enhance optimal utilization of available mental health services. (51 ref)—*Journal abstract*.

6007. Thoreson, Carl E. & Anton, Jane L. (Stanford U, School of Education, Ctr for Research & Development in Teaching) **Intensive experimental research in counseling.** *Journal of Counseling Psychology*, 1974(Nov), Vol 21(6), 553-559.—Considers that experimental research in counseling has been dominated by pretest-posttest designs. However, intensive designs that examine treatment processes and effects with individuals over time offer several advantages, such as immediate data on how treatment influences clients. K. R. Mitchell's (see PA, Vol 44:4151) article on using an intensive design is analyzed. Several design and analysis problems are discussed, such as inadequate experimental control and nonindependence of data. Alternative designs and analysis methods are presented. (30 ref)—*Journal abstract*.

6008. Weisman, Avery D. (Massachusetts General Hosp, Boston) **Coping with untimely death.** *Psychiatry*, 1973(Nov), Vol 36(4), 366-378.—Defines the differences between timely and untimely deaths within their socio-

psychological contexts. Untimely deaths include those that are premature, unexpected, and calamitous. Professional intervention techniques are outlined.

6009. Williams, Arthur R. (Private practice, Anamosa, IA) **The initial conjoint marital interview: One procedure.** *Family Coordinator*, 1974(Oct), Vol 23(4), 391-395.—Describes a model format for the initial conjoint marital interview which takes into account the need to reduce the anxiety of both partners, the elicitation of pertinent data, diagnosis and treatment plan development, the determination of the length of therapy, and the use of the interview as a teaching-supervising tool. 6 specific areas which constitute the "marital inventory" are identified—religion, friends, in-laws, activities, budget, and sex—and recommendations for obtaining complete and factual information about these areas are presented. The need to view the marriage relationship itself as a "3rd person" is discussed as a useful tool in reducing anxiety and in gaining the active cooperation of the couple.—L. Gorsey.

6010. Williams, Bertha M. (U Tennessee, Student Counseling Ctr) **Trust and self-disclosure among black college students.** *Journal of Counseling Psychology*, 1974(Nov), Vol 21(6), 522-525.—Investigated 2 models of counseling to determine which best facilitated self-disclosure and trust in 18 black undergraduates. One model involved professional counselors; the other consisted of minimally trained peer counselors. Ss were systematically assigned to 1 of the 2 models and exposed to 5 60-min counseling sessions with either a professional or a peer counselor. It was hypothesized that persons participating in a peer counseling experience will trust and self-disclose at a higher level than persons participating in a professional counseling experience. Data from the Self-Disclosure Questionnaire and J. B. Rotter's 1967 Interpersonal Trust Scale did not support the hypothesis. Both groups disclosed and trusted at a significantly higher level after treatment. (17 ref)—*Journal abstract*.

6011. Willis, Diane J. (U Oklahoma, Health Sciences Ctr, Oklahoma City) **The families of terminally ill children: Symptomatology and management.** *Journal of Clinical Child Psychology*, 1974(Sum), Vol 3(2), 32-33.—Notes that the psychologist must personally come to grips with the notion of death in order to work with the child's family. The bereaved family and siblings are discussed and several approaches to counseling the family are suggested. (18 ref)

6012. Wright, Logan. (U Oklahoma, Health Sciences Ctr, Children's Memorial Hosp, Oklahoma City) **An emotional support program for parents of dying children.** *Journal of Clinical Child Psychology*, 1974(Sum), Vol 3(2), 37-38.—Notes that children who are dying are usually aware of it, yet many parents and hospital staff members avoid the subject. Research now underway on a consultation program with dying children and their parents is described.

### Physical Treatment

6013. ———. **Psychosurgery: An NAMH position statement.** *MH*, 1974(Win), Vol 58(1), 22-23.—States the position of the National Association of Mental Health regarding psychosurgery. It is suggested that this radical procedure for control of behavior be curtailed

and used only after the serious ethical and legal issues have been fully explored and all other means of controlling behavior have been exhausted. More research utilizing nonhuman Ss is suggested.

6014. Avery, Wanda; Gardner, Carolyn & Palmer, Suzanne. (U California, San Francisco) **Vulvectomy.** *American Journal of Nursing*, 1974(Mar), Vol 74(3), 453-455.—Describes the psychological effects of vulvar carcinoma in women. Psychological factors of depression, existential anxiety, fear of disfigurement and loss of sexual-reproductive functions are characteristic of women requiring a vulvectomy. Implications of these psychological factors for professional care providers and family members are discussed.

6015. Blegvad, B. (U Hosp, State Hearing Ctr, Odense, Denmark) **Clinical evaluation of behind-the-ear hearing aids with compression amplification.** *Scandinavian Audiology*, 1974, Vol 3(2), 57-60.—42 selected patients with hearing impairment of purely perceptive type and with definite recruitment by Metz's test compared a behind-the-ear hearing aid with amplitude compression and linear amplification over a 2-mo period. 13 patients chose the compression amplifier hearing aid, while the remainder preferred the conventional amplifier. Subjective evaluation revealed only minor differences between the 2 types of apparatus.

6016. Breggin, Phyllis. (Washington School of Psychiatry, DC) **Underlying a method: Is psychosurgery an acceptable treatment for "hyperactivity" in children.** *MH*, 1974(Win), Vol 58(1), 19-21.—Explores the positive and negative effects of psychosurgery as a treatment for hyperactivity. Desired results are rarely obtained, unwanted side effects occur in the personality, and the operation is irreversible. Until more research has been conducted, discontinuation of this method of altering undesired behavior is urged.

6017. Hertz, Dan G. & Schneidman, Gurit. (Hadassah U Hosp, Hebrew U—Hadassah Medical School, Jerusalem, Israel) **Psychosomatic aspects of induced ovulation.** *Psychosomatics*, 1974, Vol 15(3), 109-112.—Reports preliminary observations on emotional reactions of 3 women conceiving after long infertility (3-7 yrs). Short clinical vignettes describe fluctuations of mood and increased emotional lability during repeated therapeutic efforts to induce ovulations. The sudden confrontation of the anovulatory woman with her reproductive ability provokes this normative crisis. Multiple intrapsychic and interpersonal factors (parental relationship, husband role, feminine identity) are considered as precipitating factors in the development. Duration of the sterile period appears to be of major importance to the extent and quality of the emotional reactions. (15 ref)—*Journal abstract*.

6018. Hingson, Ralph. (Boston U, Medical School) **Obtaining optimal attendance at mass immunization programs.** *Health Service Reports*, 1974(Jan-Feb), Vol 89(1), 53-64.—Outlines a program designed to increase attendance at mass immunization centers. Receptivity to immunization is described as a 3-step behavioral process: learning about the program, deciding to attend, and attending. (43 ref)

6019. Huang, Jacob C. & Fanta, Eugene. (New York City Dept of Health, Lower East Side Health District,

NY) **Disease patterns and the team approach to the practice of family medicine.** *Health Service Reports*, 1974(Jan-Feb), Vol 89(1), 25-30.—Presents a case report of a family in health crises. The traditional method of treating individual illnesses would not have been effective, but a team approach led to the recognition and effective treatment of the disease pattern of the family. Changes in attitude, tension reduction, and increased self-confidence were observed.

6020. Jurko, M. F.; Andy, O. J. & Giurintano, L. P. (U Mississippi, Medical Ctr, Jackson) **Changes in the MMPI as a function of thalamotomy.** *Journal of Clinical Psychology*, 1974(Oct), Vol 30(4), 569-570.—For MMPIs administered to 8 patients prethalamotomy and at varying intervals postsurgery, the only significant long-term change was a decrease in hypomania; for short-term (5 days) there was a decrease in psychasthenia.

6021. Kubala, Stephanie & Clever, Linda H. (St Xavier Coll) **Acceptance of the nurse practitioner.** *American Journal of Nursing*, 1974(Mar), Vol 74(3), 451-452.—Attempted to identify attitudinal differences toward health care delivery between patients treated by conventional physician-controlled clinics and patients treated by nurse practitioner-controlled clinics. Ss were 84 patients 40-80 yrs old from a general medical clinic who had been treated during the previous 6 mo. Their health problems were stabilized diseases which required continuing treatment. Ss were randomly assigned to 2 groups: those whose primary care was provided by their physician and those whose care was referred to a nurse practitioner. Evaluations of the patients' experience of their care, made during treatment, indicate 3 objections to nurse practitioners: (a) dissatisfaction with the title of nurse practitioner, (b) fear of changes in their established treatment, and (c) fear that continuity of care will diminish. Implications of the identified attitudinal changes are discussed in terms of educational needs for health care professionals, patients, and their families. —R. G. Gibson.

6022. Macgregor, Frances C. (New York U, Medical Ctr, Inst of Reconstructive Plastic Surgery) **Transformation and identity: The face and plastic surgery.** New York, NY: Quadrangle/New York Times Book, 1974. xxv, 230 p. \$8.95.

6023. Pfeiffer, Eric. (Duke U, Medical School) **Interacting with older patients.** In E. W. Busse & E. Pfeiffer (Eds), *Mental illness in later life*. Washington, DC: American Psychiatric Assn, 1974. vi, 301 p. \$7.

6024. Uehling, David T. (U Wisconsin, Madison) **When a patient requests vasectomy.** *Medical Aspects of Human Sexuality*, 1974(Sep), Vol 8(9), 191-192.—Describes issues in patient screening for vasectomy, in counseling both partners about possible complications and legal considerations, and in conducting follow-up evaluations of the operation. The physician must emphasize in his discussions with the patient that the operation is voluntary and probably irreversible.

### Social Casework & Rehabilitation

6025. Arcaya, Jose. (Westmoreland County Community Coll, Youngwood, PA) **Probation and parole records considered as therapeutic tools.** *Criminal Justice & Behavior*, 1974(Jun), Vol 1(2), 150-161.—Ar-

gues that 2 activities of probation officers, record-keeping and individual counseling, are complementary in nature and may be used to facilitate communication between officers and their clients. It is suggested that probation officers' records are of equal, if not greater, importance to the client than to the legal and judicial bureaucracies. How the typical probation officer maintains his records is described, along with how these records might be used to increase the probation client's self-awareness of his history and experiences. A methodology for involving the client in record-keeping activities is presented, and traditional objections which might be raised against this procedure are examined. The need to treat probation clients as responsible citizens is emphasized.—*L. Gorsey.*

6026. **Bratter, Thomas E.** (New York City Dept of Probation, Group Dynamics Project, NY) **Guardian, behavioral engineer, advocate, friend: Humanistic roles for probation officers.** *Corrective & Social Psychiatry & Journal of Behavior Technology Methods & Therapy*, 1974(Sum), Vol 20(3), 1-9.—Identifies 4 sequential role changes in the probation relationship which are believed to expedite positive and responsible behavioral change in the adolescent offender. (a) As guardian, the probation officer (PO) enforces responsible behavior. By legal mandate, he must reconstruct the parent-child relationship and must establish and enforce limits. (b) As a behavioral engineer, the PO encourages the offender to test new behavior and ways of thinking. This aspect of treatment becomes problem-solving. The most effective technique to enable the probationer to view himself realistically is confrontation. (c) As an advocate, the PO is committed to action and becomes the offender's representative, negotiator, intervener, broker, supporter, consultant, etc, particularly in facilitating educational and vocational mobility and in encouraging economic autonomy. This role enables the PO to make more demands on the adolescent to continue to actualize his potential. (d) If the probation process has been effective, the final phase of the relationship is less authoritarian. The previous relationship of unequals may, if desired by both parties, lead to the construction of a relationship of equals, i.e., to friendship. (25 ref)—*J. Sorokac.*

6027. **Braukmann, Curtis J. et al.** (U Kansas) **An analysis of a selection interview training package for predelinquents at Achievement Place.** *Criminal Justice & Behavior*, 1974(Mar), Vol 1(1), 30-42.—Evaluated the effectiveness of an interview skills training program for boys at Achievement Place, a small family-style behavior modification program for adolescents with behavior problems. The program was developed to teach appropriate social behaviors and mannerisms in job interviews. 3 experiments were conducted with a total of 6 12-16 yr old boys; Ss were rated on 4 measures—social behaviors, personal appearance, volunteering of information, and posture. Data from pre- and posttraining videotaped observations of Ss indicate (a) that the training package was effective, at least in combination with the opportunity to earn additional money, in teaching boys appropriate interview behaviors and (b) that naive trainers, given the specific training materials package, can be as effective as the present Es in teaching the various skills.—*L. Gorsey.*

6028. **Brieland, Donald.** (U Illinois, Jane Addams School of Social Work) **Children and families: A forecast.** *Social Work*, 1974(Sep), Vol 19(5), 568-579.—Considers that whether social work will be able to successfully forecast the needs of children and families in the 1980s depends on the profession's response to broader societal issues, including income security, unemployment, health services, education and advocacy, population growth, adoption, juvenile rights and child protection, and legal actions against mismanagement, mistreatment, or malpractice. Future needs in these areas that can be served by social workers are discussed. (34 ref)

6029. **Brody, Elaine M. & Brody, Stanley J.** (Philadelphia Geriatric Ctr, PA) **Decade of decision for the elderly.** *Social Work*, 1974(Sep), Vol 19(5), 544-554.—Discusses the current status of the elderly population in the US, emphasizing the role of social work in handling problems related to age discrimination, stereotypes of "old people," economic conditions, health and social service needs, the need for a widening of social and occupational roles of the elderly, and increasing the diversity and activity of their social and physical environments. (40 ref)

6030. **Cull, John G. & Hardy, Richard E. (Eds.).** (Virginia Commonwealth U) **Administrative techniques of rehabilitation facility operations.** Springfield, IL: Charles C Thomas, 1974. xv, 279 p. \$15.75.—Presents a series of 13 papers on sheltered workshop administration, personnel administration in rehabilitation facilities, training programs for workshop administrators, staff development responsibilities in rehabilitation programs, and legal and financial considerations in operating rehabilitation facilities.

6031. **Goodman, James A.** (National Academy of Sciences, Inst of Medicine, Washington, DC) **Racial minorities in the 1980s.** *Social Work*, 1974(Sep), Vol 19(5), 580-584.—Predicts that a focus on humanistic concerns during the 1980s will change conditions for minorities in the US. Current social trends and conditions that will affect the quality of life and help remove barriers to racial equality are identified, and the role of the social work profession in widening the scope of these trends is discussed.

6032. **Ho, Man Keung & McDowell, Eunice.** (U Oklahoma, School of Social Work) **The black worker-white client relationship.** *Clinical Social Work Journal*, 1973(Fal), Vol 1(3), 161-167.—Discusses factors which influence the establishment of meaningful relationships between black workers and white clients.

6033. **Irwin, John.** (California State U, San Francisco) **The trouble with rehabilitation.** *Criminal Justice & Behavior*, 1974(Jun), Vol 1(2), 139-149.—Examines the processes in the correlational setting that consistently defeat attempts to achieve humanistic and democratic models of rehabilitation. It is argued that these attempts, although planned with good intentions, run against insurmountable barriers inherent in the operations of correctional systems. The decrease in importance of postrelease rehabilitation programs, and 4 internal, often unstated, concerns of correctional officials often operate as barriers against effective rehabilitation; these concerns include increasing the ease of employee work

routes, reducing outside criticisms, maintaining moral superiority of the employees over the prisoners, and maximizing the autonomy of the bureaucracy. Data from the NewGate college education projects at several western state penitentiaries are presented which show that successful changes in correctional facilities must come from outside the institution. 4 phases of correctional-staff response to outside programs are described and cited as reasons for the failure of rehabilitative efforts. —L. Gorsey.

6034. Jaques, Marceline E. & Patterson, Kathleen M. (State U New York, Rehabilitation Counseling Program, Buffalo) **The self-help group model: A review.** *Rehabilitation Counseling Bulletin*, 1974(Sep), Vol 18(1), 48-58. —Self-help mutual aid groups are organized by peers who share a common problem. Through group identification, mutual support, and modeling, behavior is directed toward learning a new coping life style. 2 group types exist, one of individuals with a problem or condition and the other of family or friends of persons with a problem or condition. The latter type most frequently functions as an advocacy or social action group; the former are primarily occupied with their personal problem solving and programs. Alcoholics Anonymous is credited with organizing the 1st self-help group more than 35 yrs ago and providing the model for many others to follow. This "people's movement" has provided a parallel system of care to that of the professional model where it is not widely known or accepted. The self-help group model is considered to be a viable and necessary part of a total rehabilitation service system. (33 ref)—*Journal abstract*.

6035. Katrin, Susan E. (Georgia State U) **The effects on women inmates of facilitation training provided correctional officers.** *Criminal Justice & Behavior*, 1974(Mar), Vol 1(1), 5-12.—Studied the effectiveness of a 40-hr, 13-wk facilitation training program for 14 female 25-56 yr old correctional officers in terms of 105 female inmates' pre- to posttest changes on the Affect Adjective Check List, the Correctional Institutions Environment Scale, and Ziller's Self-Other Orientation Tasks. Facilitation training was conducted according to R. Carkhuff's model and was aimed at increasing the officers' abilities to relate in a helpful or facilitative manner in interpersonal encounters with inmates. Results indicate that the program had significant ( $p < .05$ ) effects in reducing inmate anxiety levels and increasing inmates' social interest and the officers' communication abilities. No effects on inmates' perceptions of the correctional environment or on their self-esteem scores were found. (15 ref)—L. Gorsey.

6036. Kraus, J. (Dept of Child Welfare & Social Welfare of New South Wales, Sydney, Australia) **A comparison of corrective effects of probation and detention on male juvenile offenders.** *British Journal of Criminology*, 1974(Jan), Vol 14(1), 49-62.—Studied 223 offenders given probation and 223 committed to an institution, matched for age at sentence, year of sentence, type of offense, age at 1st offense, number and type of previous offenses, and number of previous detentions. For most offenses recidivism was higher after detention than after probation, for "behavior problems" results were the same after both treatments, and "take and use

vehicle" offenders responded better to detention. The frequency and types of offenses following probation and detention are reported. Offenders previously in institutions responded better to probation than to detention. There was no difference in the amount of recidivism following single and multiple commitments to an institution. (29 ref)—D. R. Evans.

6037. Kyst, Ebbe. (Aarhus State Hosp, Clinic for Ambulant Treatment of Neurosis, Aarhus, Denmark) **[Psychological and social adaptation in patients undergoing long-term hemodialysis.]** (Danh) *Nordisk Psykiatrisk Tidsskrift*, 1974, Vol 28(2), 107-123.—9 female and 15 male patients (age 21-70) undergoing hemodialysis (Hd) were interviewed by a psychiatrist 3-5 times in 5 mo. Problems of adjustment were experienced by all Ss during the 1st weeks of Hd; these problems frequently subsided without psychiatric care. 10 Ss were judged to be candidates for recurring psychiatric treatment, but no psychotic reactions were found, and only 1 instance of "concrete suicidal impulses." Existential problems were rarely reported. Of 17 married Ss, almost 2/3 claimed to have experienced a deepening of their relationship; half of the Ss reported increased dependency on the spouse. Most Ss reduced their sexual activity. Significant decrements in social life, sports, and travelling were noted. It is recommended that psychologists or psychiatrists retain contact with all Hd patients in order to evaluate and meet their need for psychotherapy and to encourage group activities. (29 ref)—R. G. Wikmark.

6038. Morris, Robert. (Brandeis U, Florence Heller Graduate School for Advanced Studies in Social Welfare) **The place of social work in the human services.** *Social Work*, 1974(Sep), Vol 19(5), 519-531.—Foresees that in the 1980s the major changes in social work will occur in the medical and mental health systems. Social workers will become essential to these systems as health care is extended further from its hospital base into the community, which will require more attention to management and integration of community services.

6039. Payne, James S.; Mercer, Cecil D. & Epstein, Michael H. (U Virginia) **Education and rehabilitation techniques.** New York, NY: Behavioral Publications, 1974. ix, 307 p.—Describes theories, services, and procedures which can be used to aid the handicapped in obtaining employment and adjusting to a work situation. A model for effecting the education and rehabilitation of the handicapped is presented, along with descriptions of actual skills needed for securing and maintaining jobs, and the services and delivery systems necessary for the career education of young children. (16 p ref)

6040. Platt, Jerome J. & Scura, William C. (Hahnemann Medical Coll & Hosp, Experimental Studies Section, Community Mental Health Ctr, Philadelphia, PA) **Peer judgments of parole success in institutionalized heroin addicts: Personality correlates and validity.** *Journal of Counseling Psychology*, 1974(Nov), Vol 21(6), 511-515.—Studied the validity and personality correlates of peer judgments of parole success in 89 incarcerated heroin addicts (mean age = 22.1 yrs). Ss completed a battery of personality measures, including Rotter's Internal-External Control Scale, the Death Concern Scale, the Adjective Check List, and the Sensation-Seeking Scale. Ss judged as successes by their peers, in

contrast to peer-judged failures, had significantly higher rates of parole success at 6 and 15 mo following release and differed significantly from the failures on 17 of 33 personality dimensions. Results are discussed within the context of previous studies of peer ratings in other settings, and implications for research are noted. (20 ref) —*Journal abstract.*

6041. Pooley, Richard. (Pendleton Project, Chesapeake, VA) **Work release programs and corrections: Goals and deficits.** *Criminal Justice & Behavior*, 1974(Mar), Vol 1(1), 62-72.—Discusses the rationale, administration, housing and food service procedures, financial considerations, psychosocial factors, and treatment procedures in work-release programs. The problems of the discrepancy between expectations and reality experienced by the work-release resident and determining the extent of administrative authority are discussed.

6042. Rootes, Lloyd E. (Iowa State Reformatory, Anamosa) **The effect of achievement motivation training on women prisoners.** *Criminal Justice & Behavior*, 1974(Jun), Vol 1(2), 131-138.—Studied the effectiveness of a program that emphasized teaching the participants behaviors characteristic of persons with high achievement motivation. A control group received the same 24-hr series of films, discussions, and games but without emphasizing the achievement element. Ss were 42 residents of a women's reformatory. The Edwards Personal Preference Schedule (EPPS), the Work Performance Report (WPR), and the Mehrabian Achievement Scale for Women (MASW) were used as pre- and posttest evaluation measures. No significant differences in pre- to posttest scores on any of the 3 measures were found in either of the 2 groups, although there was a significant difference between posttest EPPS Achievement Scale scores of the 2 groups. The hypothesis that EPPS and MASW scores would be significantly correlated was not supported. Performance of experimental Ss increased after training as assessed by WPR posttest scores.—*L. Gorsev.*

6043. Schnelle, John F. & Lee, J. Frank. (Middle Tennessee State U) **A quasi-experimental retrospective evaluation of a prison policy change.** *Journal of Applied Behavior Analysis*, 1974(Fal), Vol 7(3), 483-496.—Used an interrupted time-series design and quasi-experimental logic to assess the behavioral effects of a prison disciplinary intervention on approximately 2,000 adult male inmates. The uncontrolled nature of the prison environment prevented experimental analysis of intervention effects. The quasi-experimental methodology applied in this study exemplifies how data, otherwise lost, can be retrieved. In addition, the process by which qualified conclusions can be drawn from the retrieved data is demonstrated.—*Journal abstract.*

6044. Seron, X. & Tissot, R. (U Liege, Belgium) **[Re-education of a left spatial agnosia.]** (Fren) *Acta Psychiatrica Belgica*, 1973(Jul), Vol 73(4), 448-457.—Conducted programed exercises with a patient suffering from a moderate left spatial agnosia, resulting in considerable amelioration of his symptoms. Examples of the exercises are included. (Dutch, English, German, Italian, & Spanish summaries)

## Hospital Programs & Hospitalization & Institutionalization

6045. ———. **A school-hospital remotivation program: Veterans Administration Hospital, St Cloud, Minnesota.** *Hospital & Community Psychiatry*, 1974(Oct), Vol 25(10), 661-664.—Describes a program in which 6th graders in a social studies class serve as remotivational therapists for chronic geriatric patients. The program has increased ties between hospital and community and has improved the quality of life for elderly patients.

6046. Bergmann, Thesi. **Children in the hospital.** New York, NY: International Universities Press, 1965. 162 p. \$2.45.—Based on the authors' experiences in a children's hospital, children's reactions to specific illnesses and the relationship between personality and the speed of recovery are discussed. Ways of giving emotional aid to children in the hospital, recommendations for modifying hospital procedures, and specific case histories are presented.

6047. Bovier, Ph.; Giacobino, P.; Mottaz, Y. & Richard, J. (U Genève, Clinique Psychiatrique, Switzerland) **[Reflections on an analysis of 100 recent admissions to the geriatric service of the university psychiatric clinic in Geneva.]** (Fren) *Annales Médico Psychologiques*, 1974(Apr), Vol 1(4), 494-514.—Analyzed 100 geriatric hospital admissions by diagnosis, sex, source of referral, reasons for hospitalization, and the percentage of patients returned to home or other domicile. Most patients presenting a psychiatric problem were discharged within 3½ mo (93%); few patients with organic-cerebral disorders could be released in the same time period (38%).—*H. E. King.*

6048. Burrill, Roger H.; McCourt, James F. & Cutter, Henry S. (VA Hosp, Brockton, MA) **Beer: A social facilitator for PMI patients?** *Gerontologist*, 1974(Oct), Vol 14(5, Pt 1), 430-431.—Ratings of 30 psychiatric medically infirm males (mean age = 60 yrs) who were given beer or soda in a "pub-like" atmosphere indicate no differences between groups in social responsiveness; all patients became more sociable as the session progressed. Results do not support the indiscriminate use of "beer therapy" with these patients.

6049. Byrd, Richard E.; La Londe, Christopher & Soth, Nancy. **Four stages of institutional development in an adolescent psychiatric hospital.** *Hospital & Community Psychiatry*, 1974(Oct), Vol 25(10), 655-659.—Proposes that a new institution has 6 tasks to perform, each associated with a critical stage of development or critical issue. In a new adolescent psychiatric hospital, 4 critical incidents were identified that reflect the 1st 4 tasks of staffing, organizing, planning, and controlling; the incidents and their resolution are described.

6050. Chanoit, P. F. & Ceballos de Traversa, B. **[Preliminary inquiry on the long-term course of patients leaving the psychiatric hospital: Methodology and rationale.]** (Fren) *Annales Médico-Psychologiques*, 1974(May), Vol 1(5), 609-626.—Presents preliminary findings on 100 psychotic and nonpsychotic patients, taken from a larger study planned to include posthospital follow-up of 2,000 patients. The 100 patients were members of a teacher's benefit society, which poses certain problems in posthospital surveillance because of the typically mobile nature of the profession, and

because a direct approach to recovered patients is not feasible owing to the public nature of their work. Follow-up of the trial group of 100 was difficult but feasible; most could be found for investigation 10 yrs after discharge. Questionnaires were completed at the time of hospitalization, on discharge, and 10 yrs later. Data from the preliminary sample (age and sex distribution, nosological classification, rated improvement, etc) are presented, but their value is considered to rest mainly in discovering the adequacy of data collection methods and the closeness of fit of the chosen group to the larger sample from which it was selected. Findings based on the full sample are expected to provide information of a kind unavailable in the usual epidemiological study, which is limited to hospital discharge data only or to short-term follow-up after leaving hospital care.—*H. E. King.*

6051. Colthart, Shirley M. (U Rochester, Medical School) **A mental health unit in a skilled nursing facility.** *Journal of the American Geriatrics Society*, 1974(Oct), Vol 22(10), 453-456.—Outlines the services available in a 44-bed geriatric unit and presents statistics on 103 53-95 yr old patients. The majority of the patients responded to treatment by some increase in their activities and improved feelings of dignity and self-esteem. The lack of nursing-home beds for the continued care of Medicaid patients and lack of adjunctive services (e.g., day-care center, workshop, and transportation) are cited. It is argued that physicians, psychiatrists, nurses, social workers, patients, and their families must work together. Whether based in a community mental health center or elsewhere, a Geriatric Team gains expertise in providing service to the patients, in consultation with other medical facilities, and in locating community resources.—*Journal abstract.*

6052. Copp, Laurel A. (Veterans Administration, Washington, DC) **The spectrum of suffering.** *American Journal of Nursing*, 1974(Mar), Vol 74(3), 491-495.—Studied hospital patients' experience of suffering, their coping styles, and strategies for minimizing pain. Nursing students interviewed 148 patients in 5 hospitals asking questions about the meaning of pain and suffering. The 5 most common descriptions of pain given by the patients were that it was treacherous, mean, hateful, detestable, and sneaky. Pain was personified as female twice as often as male. Using Z. J. Lipowski's (1970) categories of meanings of illness, patients verbalized suffering as challenge, enemy, punishment, weakness, relief, strategy, loss, or value. 6 strategies were used to cope with suffering: (a) counting, (b) words, (c) deep thinking and visualization, (d) attempting mind-body separation, (e) distraction, and (f) contact with people. Implications from the patients' responses in the interviews are discussed in relation to patient care.—*R. G. Gibson.*

6053. Dolan, Patricia O. & Flumere, Judith A. (Boston U) **Patients' coffee hour.** *American Journal of Nursing*, 1974(Mar), Vol 74(3), 479-480.—Discusses the use of a morning coffee hour to increase patient socialization behavior. Hospital volunteers and students with nursing staff support provided a coffee hour for medical-surgical patients in a Boston hospital. Decreases in boredom and loneliness, and increases in patient interaction, socialization, and interest in personal appearance were reported.

6054. Finkelstein, Mildred & Rosenberg, Gilbert. (Maimonides Hosp & Home for the Aged, Montreal, Quebec, Canada) **New lifestyle for the aged in a long-term hospital.** *Journal of the American Geriatrics Society*, 1974(Nov), Vol 22(11), 525-527.—Suggests that the aged patient in an institution can be helped to develop a new lifestyle. A structured atelier workshop is described and illustrated with 3 brief case histories. A key factor in success is raising the patient's standard of work so that he can perform as an artisan and sell products of professional quality. The patient benefits by the tangible recognition that he is a part of the working force and thus finds it easier to accept the institution as his community.—*Journal abstract.*

6055. Garetz, Floyd K. & Peth, Peter R. (U Minnesota, Medical School) **An outreach program of medical care for aged high-rise residents.** *Gerontologist*, 1974(Oct), Vol 14(5, Pt 1), 404-407.—Discusses the purposes and effects of an outreach medical care program for the elderly. Medical self-neglect of older adults in a subsidized congregate living setting was attributed to problems of mobility, finance, and inadequate health service delivery models. These problems were surmounted successfully by a carefully planned, comprehensive health service dispensary located within a high-rise apartment complex. Goals of service, teaching, and consultation via interdisciplinary team solutions to multiple problems were achieved, demonstrating a viable approach to geriatric care.—*Journal abstract.*

6056. Geiger, O. Glenn & Johnson, Lorelei A. **Positive education for elderly persons: Correct eating through reinforcement.** *Gerontologist*, 1974(Oct), Vol 14(5, Pt 1), 432-436.—Implemented a positive continuous reinforcement procedure for 6 geriatric patients with severely low rates of correct eating. The reversal-type experimental design was used, in which each S was his or her own control. Average correct eating increased from 12% of meals eaten correctly at the beginning of the study to 84% of meals eaten correctly at the end of the study. The technique can be readily employed in professional practice. (17 ref)—*Journal abstract.*

6057. Groeschel, Benedict J. (Children's Village, Dobbs Ferry, NY) **Social adjustment after residential treatment.** In D. F. Ricks, A. Thomas & M. Roff (Eds), *Life history research in psychopathology: III*. Minneapolis, MN: University of Minnesota Press, 1974. x, 383 p.

6058. Gunzburg, H. C. (Hosp for the Mentally Subnormal, Birmingham, England) **The physical environment of the mentally handicapped: IX. The search for a home environment.** *British Journal of Mental Subnormality*, 1974(Jun), Vol 20(38, Pt 1), 28-42.—Critically appraises results of an exercise in which 3rd-yr architecture students redesigned a living unit for mentally handicapped Ss to create a home-life, noninstitutional environment. The design aspects of 6 floor plans are evaluated with regard to the Ss' special needs.

6059. Hailey, Anthea M. (MRC Social Psychiatry Unit, Inst of Psychiatry, London, England) **The new chronic psychiatric population.** *British Journal of Preventive & Social Medicine*, 1974(Aug), Vol 28(3), 180-186.—Used data from the psychiatric case register of the Camberwell section of London, England, to examine characteristics and the development of a new chronic

population in 3 types of psychiatric care—inpatient, day patient, and hostel care. For the period from 1964 to 1972, the number and characteristics of new long-term patients in each form of care are analyzed. The net accumulation of new long-term patients appeared to stabilize after a few years; the population of long-term day patients and residents in psychiatric hostels was still increasing. The epidemiological basis of the study allowed the number of cases to be expressed as rates/head of population.—*Journal abstract.*

6060. Kalogerakis, Michael G. (Bellevue Hosp, New York, NY) **Hospitalization of personality disorders.** In J. R. Lion (Ed), *Personality disorders: Diagnosis and management.* Baltimore, MD: Williams & Wilkins, 1974. xi, 432 p. \$21.—Discusses admission, adjustment, and treatment of adolescents hospitalized for personality disorders. Appropriate criteria for admitting such patients to a hospital are described, and the management of hospitalized personality disorders is examined in terms of structure, staff, goals and methods, and special problems. Administrative issues related to hospitalization are also noted.

6061. Liebman, Mayer C. & Hedlund, Douglas A. (Sheppard & Enoch Pratt Hosp, Towson, MD) **Therapeutic community and milieu therapy of personality disorders.** In J. R. Lion (Ed), *Personality disorders: Diagnosis and management.* Baltimore, MD: Williams & Wilkins, 1974. xi, 432 p. \$21.—Discusses the history, rationale, and development of the therapeutic community concept in the treatment of the mentally ill and its specific applications to personality and related disorders. Issues in the use of the intermediate and long-term psychiatric hospital and nonhospital settings as treatment approaches to personality and nonpsychotic disorders are examined, and psychosocial (interpersonal), personality (intrapsychic), and learning models of the efficacy of the therapeutic community are described. (113 ref)

6062. Lyon, Keith E. & Zucker, Robert A. (Michigan State U) **Environmental supports and post-hospital adjustment.** *Journal of Clinical Psychology*, 1974(Oct), Vol 30(4), 460-465.—Examined the informal interpersonal influences present in the environment of 38 patients after release from a short-term psychiatric inpatient unit. These influences were related to 2 measures of adjustment based on a self-administered symptom check list: (a) absolute symptomatology at 3 mo and (b) the difference in symptomatology as indicated by a comparison of scores on the checklist administered on the ward and those at 3 mo. Results show that a stable home life (marriage, high home living involvement, older age, and many home activities) was linked with low 3-mo symptomatology as was the presence of benign visitors. The ease with which the individual clusters divided themselves on statistical and content levels implies that the concept of environmental support is not a unitary one and suggests that the areas of home life and involvement with others should be studied independently.—*Journal summary.*

6063. Marks, Patricia & Ball, Thomas S. (Pacific State Hosp, Pomona, CA) **Hazardous voluntary falling: A treatment approach.** *Mental Retardation*, 1974(Oct), Vol 12(5), 36-39.—Prior to treatment, a nonverbal, 8-yr-old

severely retarded child was confined in an enclosed crib 17 hrs/day to prevent hazardous voluntary falling. The treatment program involved the technique of developing a small rug as a cue and, concurrently, a conditioned reinforcer for sitting. The rug, when placed on a stool or bed, served the dual function of controlling falling and reinforcing appropriate sitting or lying. It was demonstrated that bed- and stool-falling changed as a function of rug placement and control over falling was retained even after the rug was no longer in use.—*Journal abstract.*

6064. McLachlan, Eileen. (California State U, Los Angeles) **Recognizing pain.** *American Journal of Nursing*, 1974(Mar), Vol 74(3), 496-497.—Discusses subtle and obvious behavioral responses to pain. Although thresholds for pain do not vary significantly, reactions to pain differ among cultures and individuals. Subtle affect changes include excitement, irritability, depression, withdrawal, and behavior reversals. Techniques for assessment of subtle behavior and their implications for nursing care are discussed.

6065. Megargee, Edwin I. (Florida State U) **Applied psychological research in a correctional setting.** *Criminal Justice & Behavior*, 1974(Mar), Vol 1(1), 43-50.—Describes a cooperative research and data collection program conducted at a medium security institution for youthful offenders. Group testing, interviewing, autonomic nervous system screening, central records scanning, progress report development, and exit-data collection procedures are described, and suggestions for research and implications of research in a correctional institution are discussed.

6066. Midenet, Marc. [Leaving the psychiatric hospital after more than 10 years of hospitalization.] *(Fren) Annales Médico-Psychologiques*, 1974(May), Vol 1(5), 583-606.—Presents 17 case histories of patients hospitalized for at least 10 yrs, released, and remaining out of the hospital for at least 1 yr. The group was clinically heterogeneous, although most carried a diagnosis of schizophrenia or alcoholism. Questions raised concern the factors leading to prolonged confinement, the forces eventually mobilized to provide belated release, and the role played by social or familial influences. 2 common elements seem identifiable. (a) The most recent advances in chemotherapy have finally ameliorated even those cases previously resistant to drug treatment. (b) Most patients in the delayed-release group faced an unusually rejecting family or social situation, characterized by an active refusal to accept the patient for convalescence. Changes in either the patient's attitude toward self-management or in the family's attitude toward acceptance were probably decisive in effecting ultimate discharge. Only 4 returned to some form of family living; 13 either became self-sustaining or found employment in a protective (though nonhospital) environment, such as in a community for the retired. A greater optimism among treatment staff, based on psychopharmacologic advance, is likely also to have produced subtle changes in the psychological support offered to patients formerly considered beyond recovery.—*H. E. King.*

6067. Miller, Ralph H. & Keith, Robert A. (Claremont Graduate School, Social-Environmental Psychology

Program) **Behavioral mapping in a rehabilitation hospital.** *Rehabilitation Psychology*, 1973(Win), Vol 20(4), 148-155.—Raises the question of how long patients should remain in treatment for best results, and contends that they are poorly integrated into the social structure of the hospital.

6068. Moss, Sidney Z. & Moss, Miriam S. (Northwest Community Mental Health Ctr, Philadelphia, PA) **Mental illness, partial hospitalization, and the family.** *Clinical Social Work Journal*, 1973(Fal), Vol 1(3), 168-176.—Reports a 1-day hospital program with an average daily attendance of 35 members. Patients are primarily black, and are from 16 to 65 yrs old. The primary treatment is multiple group interaction, with emphasis on the here-and-now. The setting is nonmedical. How the family is involved in treatment is described.—S. R. Stein.

6069. Oudenne, William. (New Jersey Dept of Institutions, Management Operations, Trenton) **Resident labor: A practical solution in New Jersey state institutions.** *Mental Retardation*, 1974(Oct), Vol 12(5), 17-19.—Describes a 2-phase program for reducing resident labor in public institutions for the mentally retarded and the successful pursuit of this goal in state institutions. A proposal for equitable compensation of trainees and marginal workers is briefly reviewed.

6070. Rosenblatt, Aaron. (Bronx State Hosp, NY) **Providing custodial care for mental patients: An affirmative view.** *Psychiatric Quarterly*, 1974, Vol 48(1), 14-25.—Traces the changes in state mental hospitals from being primarily custodial institutions through being an agency for delivering long-term mental health care to the present emphasis on being an acute short-term treatment facility. During the last 20 yrs, efforts have been made to attack the problem of custodial care by setting up special units to prevent hospitalization. These special programs are generally either supplementary or experimental and, it is argued, if relied on exclusively would result in the death of the state mental hospital. Arguments against this latter course are cited, and a new approach to providing custodial care is described. This arrangement is predicated on (a) allowing custodial patients to select for themselves the alternatives of remaining in hospital or being treated "in the community," (b) providing in-hospital custodial care which is less restrictive but regulated to provide more harmonious relations among the residents, and (c) providing mental health care and contact with community social and health agencies.—B. McLean.

6071. Rowe, Dorothy. (St John's Hosp, Lincoln, England) **The effect of a more stimulating environment on the behaviour of a group of severely subnormal adults.** *British Journal of Mental Subnormality*, 1974(Jun), Vol 20(38, Pt 1), 6-13.—Assessed 21 17-38 yr old severely subnormal male patients (IQ under 30, mental age about 2 yrs) on a hospital ward to develop a more enriched environment. Piagetian techniques for analyzing the sensorimotor period were applied and a program of activities instituted (e.g., simple gymnastics, physiotherapy, art therapy, field trips). Follow-up assessment 7 mo later showed that 14 Ss had reached Stage 6 of Object Permanence, Piaget's stage at which language begins to develop. It is concluded that a more stimulat-

ing environment can help mental subnormals realize more potential, possibly even helping to reach the stage of language if begun early.—R. Hall.

6072. Sand, Patricia & Berni, Rosemarian. (U Washington, Medical School) **An incentive contract for nursing home aides.** *American Journal of Nursing*, 1974(Mar), Vol 74(3), 475-477.—Studied the effects of incentive contracting on the behavior of nursing home aides and patients. Aides and 16 patients were given monetary incentives for increasing the time patients spent out of bed and the amount of talking and other social behavior by patients. Baseline data of patient activity were recorded by student observers 2 wks prior to the treatment intervention period. For 3 wks aides participated in weekly 15-min training sessions on techniques for increasing patient activity and social behavior. The patients were randomly assigned to an incentive contract group or a control group. In the experimental group aides and patients were given \$5.00 and \$2.00 respectively for each patient demonstrating a 1/2 increase in the frequency of the specified behaviors in a 1-wk period. Results indicate that 5 of the 8 patients in the experimental group demonstrated statistically significant increases in activity levels. Patients in the control group demonstrated increased activity but not to a significant degree. Implications for nursing administrators are discussed.—R. G. Gibson.

6073. Scheer, Nancy & Barton, Gail M. (Ann Arbor Area Community Services, Washtenaw County Community Health Ctr, MI) **A comparison of patients discharged against medical advice with a matched control group.** *American Journal of Psychiatry*, 1974(Nov), Vol 131(11), 1217-1220.—Studied prospective admission and follow-up variables by comparing 21 psychiatric patients leaving an institutional facility against medical advice (AMA) with 21 control patients. It is concluded that leaving AMA is not necessarily detrimental to patients 3 or 6 mo after discharge, that the patient may actually be running toward health rather than away from treatment, that the AMA patients have a different relationship with the staff than non-AMA patients, and that effort might be spent in educating the staff and milieu that an AMA discharge may be beneficial therapeutically rather than a negative occurrence.—Journal abstract.

6074. Siegle, Dorothy S. (California State U, San Jose) **The gate control theory.** *American Journal of Nursing*, 1974(Mar), Vol 74(3), 498-502.—Discusses the gate control theory of pain, advanced by R. Melzack and P. D. Wall (1968), that pain can be modulated in the spinal cord, brain stem, and cerebral cortex, and that an individual's perception and interpretation of pain are affected by the central nervous system in the cerebral cortex and thalamus. The interaction of 3 cerebral processes affects the psychological factors of perception and interpretation: (a) sensory-discriminatory, (b) motivational-affect, and (c) cognition activities. A number of interventions are described as effective in modulating these cerebral processes. Implications of the gate control theory are discussed in relationship to medical and nursing care of individuals with pain.—R. G. Gibson.

6075. Stotsky, Bernard A. (Geriatric Memory Clinic, Needham, MA) **Extended care and institutional care: Current trends, methods, and experience.** In E. W.

Busse & E. Pfeiffer (Eds), *Mental illness in later life*. Washington, DC: American Psychiatric Assn, 1974. vi, 301 p. \$7.

6076. Suedfeld, Peter. (U British Columbia, Vancouver, Canada) **Solitary confinement in the correctional setting: Goals, problems, and suggestions.** *Corrective & Social Psychiatry & Journal of Behavior Technology Methods & Therapy*, 1974(Sum), Vol 20(3), 10-20.—Solitary confinement, or isolation, can serve 4 major purposes: (a) indoctrination and interrogation, (b) quarantine, (c) punishment, and (d) rehabilitation. The ethical problems involved in forcible indoctrination, the eliciting of confessions, the brutalizing effect on the interrogator, and the adverse effect on society, make the use of solitary confinement for indoctrination and interrogation often questionable, unethical, and illegal. The 2nd use of isolation, quarantine, has 3 major goals: to protect the individual from being harmed by other prisoners; to protect other people, inside or outside the institution; and to protect the individual against himself (suicide). Perhaps the most widely used application of isolation in North America is for punishment, the "hole." In general, punitive measures do not seem to reduce or eliminate recidivism, nor to turn inmates towards a more productive life. The effectiveness of the "hole" is doubtful enough to warrant rejecting it as a punishment. Used in a moderate and carefully controlled way, however, as part of a sensible rehabilitative system, isolation and reduced sensory input may be effective and humane tools in helping inmates to develop noncriminal styles of life. (60 ref)—J. Sorokac.

6077. Sugaya, Katsuhiko. [Milieu therapy of enuresis: A case study.] (Japn) *Japanese Journal of Child Psychiatry*, 1972(Sep), Vol 13(5), 332-338.—Reports the successful treatment of a 16-yr-old girl with severe nocturnal enuresis since infancy. After running away from home she was brought to a child guidance clinic. As there was no enuresis at the clinic, it was decided that it was caused by environmental factors. Milieu therapy was conducted for 1 yr 3 mo, during which time the patient's relationships with the therapists and her family improved greatly. Upon returning home there was no recurrence of enuresis. (English summary)—S. Ohwaki.

6078. Talkington, Larry W. (Fairview Hosp & Training Ctr, Salem, OR) **Resident advice: A viable management tool.** *Mental Retardation*, 1974(Oct), Vol 12(5), 20.—Describes a resident advisory council in a public institution for the retarded that (a) explored the potential use of any advice made by the group; (b) secured direct consumer input to top administration relative to program offerings, services, and policies; and (c) provided an occasion for top management and staff personnel to relate to representative residents.

6079. Thralow, Joan U. & Watson, Charles G. (VA Hosp, St Cloud, MN) **Remotivation for geriatric patients using elementary school students.** *American Journal of Occupational Therapy*, 1974(Sep), Vol 28(8), 469-473.—Describes the design and evaluation of a remotivation program for 72 chronically ill geriatric patients. 36 experimental patients, 36 control patients, and 36 6th graders were included in the program. The school children and the experimental patients met biweekly in discussion groups for 3½ mo using a 4-step

group process format to promote the development of interpersonal relationships and a renewed interest in living among the geriatric patients. Both patient groups were rated by the Nurses Observation Scale for Inpatient Evaluation (NOSIE-30), and remotivation and morale self-evaluation scales. Ss were rated before the program started, 11 wks after it started, and 4 wks after its completion. Data show that the experimental Ss significantly improved in several areas, including interest in community or home events, desire for travel and visitors, feelings about staff and treatment, and desire to participate in hospital activities.—*Journal abstract*.

6080. Venkatramiah, S. R. (Sri Venkateswara U, Tirupati, India) **Low cost one-way vision screen for unobserved observation in child guidance clinics.** *Child Psychiatry Quarterly*, 1974(Apr), Vol 7(2), 14-15.—Describes the construction and functioning of a 1-way vision screen to observe children. The materials and costs of such a device are listed.

6081. Vitello, Stanley J. (Pennsylvania State U) **Cautions on the road to normalization.** *Mental Retardation*, 1974(Oct), Vol 12(5), 39-40.—Discusses the development of institutionalized care in the US for the mentally retarded and offers 10 cautions regarding the training and education of the severely and profoundly retarded.

6082. Welch, Michael W. & Gist, Jerre W. (U Alabama, Ctr for Developmental & Learning Disorders) **The open token economy system: A handbook for a behavioral approach to rehabilitation.** Springfield, IL: Charles C Thomas, 1974. xii, 189 p.

6083. Wilson, Bertrand. **A quest for justice: My confinement in two institutions.** Hicksville, NY: Exposition, 1974. 112 p. \$5.—Describes one man's battle for his freedom throughout 9 yrs (1942-1951) of illegal incarceration in modern mental hospitals.

6084. Wright, E. C.; Abbas, K. A. & Meredith, C. (Queen Mary's Hosp for Children, Carshalton, England) **A study of the interactions between nursing staff and profoundly mentally retarded children.** *British Journal of Mental Subnormality*, 1974(Jun), Vol 20(38, Pt 1), 14-17.—Observed 16 9-18 yr old ambulant children (mental age 18-24 mo or less) in 5 hospital wards for interactions promoting positive, negative, or neutral patient behavior. An extreme poverty of interpersonal exchange between Ss and staff was noted and a lack of Ss' attempts to relate to staff. Findings suggest a need to (a) revise training for nurses caring for mentally retarded children; and (b) consider other types of staff training, other forms of long-term care, and the need for larger staffs.—R. Hall.

## EDUCATIONAL PSYCHOLOGY

6085. Blumenfeld, Warren S. & Sartain, Patricia L. (Georgia State U) **Predicting alumni financial donation.** *Journal of Applied Psychology*, 1974(Aug), Vol 59(4), 522-523.—Attempted to predict alumni financial donation or nondonation from demographic information available at graduation. Records of 59 donors and 59 nondonors were item analyzed. Weights were assigned and cross-validated using the records of 50 held-out

donors and 50 held-out nondonors. A biserial correlation of .37 ( $p < .01$ ) was obtained.

6086. Colvard, R. & Bennett, A. M. (American Coll Testing Program, Iowa City, IA) **Patterns of concentration in large foundations' grants to US colleges and universities.** *ACT Research Reports*, 1974(Apr), No 63, 30 p.—Presents data on all grants reported by 276 foundations in 1963, 1966, 1969, and 1970 to US universities and colleges in terms of amount of grant, type of institution, geographic location, and purpose of grant. Findings indicate that each year at least 46% of grants and 75% of the actual funds involved came from no more than 25 of the foundations. (24 ref)

6087. Newton, Fred B. (U Georgia, Counseling & Student Personnel Services) **The effect of systematic communication skills training on residence hall paraprofessionals.** *Journal of College Student Personnel*, 1974(Sep), Vol 15(5), 366-369.—Developed a 12-hr training program to increase paraprofessional housing staff functioning in communication skills. The training model combined what is known about basic communication dimensions with the use of simulation and role playing in a housing setting. Ss were 32 student personnel assistants. Analysis by covariance found significant increases for the treatment group on the 3 Carkhuff communication scales: Empathic Understanding, Respect, and Communicative Accuracy. There were no significant sex or experience differences.—*Journal abstract*.

6088. Winer, Jerry A.; Pasca, Alyce E.; Dinello, Frank A. & Weingarten, Samuel. (U Chicago) **Nonwhite student usage of university mental health services.** *Journal of College Student Personnel*, 1974(Sep), Vol 15(5), 410-412.—Asked 39 mental health program directors at 20 universities why their services were not being used by nonwhite students. 4 major explanations for this nonuse were mentioned, each being supported by  $\frac{1}{4}$  -% of the directors: (a) nonwhite students are committed to an antiestablishment viewpoint which precludes seeking help from a service identified with the majority, (b) many black students wish to see black staff members and the clinics have too few to meet the demand, (c) minority students are less psychologically minded and feel their problems are environmentally or socially oriented rather than personality related, and (d) services other than mental health clinics were attracting nonwhites. It is suggested that many mental health professionals are not fully meeting their responsibilities to nonwhite students.—*L. Gorsey*.

#### School Administration & Educational Processes

6089. Abt, Clark C. (Abt Assoc, Cambridge, MA) **Forecasting the cost-effectiveness of educational incentives.** *Educational Technology*, 1974(Mar), Vol 14(3), 27-29.—Demonstrates how cost-benefit analysis can be used to forecast the performance of educational incentives. Examples of typical incentives and the associated measures of effectiveness are provided. A hypothetical analysis is presented.

6090. Adams, Gerald R. & Cohen, Allan S. (Pennsylvania State U) **Children's physical and interpersonal characteristics that effect student-teacher interactions.** *Journal of Experimental Education*, 1974(Fal), Vol 43(1),

1-5.—Studied the impact of student characteristics on the quality of teacher-student interactions in a naturalistic setting. Ss were teachers in 3 kindergarten, 4 4th, and 3 7th grade classrooms who were observed by 3 elementary school principals and a professor of education over a 6-mo period. Ss were rated on teacher attentiveness to pupils, permissiveness-flexibility, degree of affection displayed toward students, and teaching style. Ss were asked to rate each of their students on 4 measures of physical and interpersonal attractiveness, 2 undergraduates categorized the observation data into verbal support, control, and neutral statements. There were no significant effects of the student's verbal ability, level of disruptive behavior, or personal appearance on the frequency of teacher-student interactions, although facial attractiveness had some effect, and there was a significant Grade Level  $\times$  Facial Attractiveness interaction. Limitations of the data because of the higher mean IQs of the 4th graders are discussed.—*L. Gorsey*.

6091. Alexander, Karl L. & Eckland, Bruce K. (Johns Hopkins U) **Sex differences in the educational attainment process.** *American Sociological Review*, 1974(Oct), Vol 39(5), 668-682.—Used longitudinal data on a national sample of 2,077 students first surveyed as high school sophomores in 1955 and later followed up in 1970 to assess sex main and interaction effects in an elaborated school process model. Results indicate the following: (a) despite positive sex effects for women in terms of academic performance and self-concepts and despite simultaneous controls on status background variables, ability, curriculum, the influence of significant others (parents, teachers, and peers), and college plans, a relatively strong and unmediated depressant sex effect remained for the educational attainment of women in the late 1950s. (b) Status background influences were a double liability for women in that such influences were considerably more determinant of high school process and outcome variables for females, while academic ability was more important for males. (c) At the college level, whereas the influence of family origins was modest for both sexes, ability remained considerably more important for the continuing educational progress of men. (35 ref)—*Journal abstract*.

6092. Anderson, Robert H. & Hemenway, Robert E. (Memphis State U) **Pre-student teaching practicum with exceptional children: A program description.** *Education & Training of the Mentally Retarded*, 1974(Oct), Vol 9(3), 152-157.—Describes a newly developed teaching experience for the educable-mentally-retarded teacher trainee at the junior year level. The program represents a commitment on the part of teacher educators at the university level to provide relevant experiences for students and to improve the quality of training programs even when student enrollment is large.

6093. Averch, Harvey A. et al. **How effective is schooling? A critical review of research.** Engelwood Cliffs, NJ: Educational Technology Publications, 1974. xvi, 258 p. \$9.95.—Uses 5 research approaches—input-output, process, organizational, evaluation, and experiential—as the basis for analyzing research on the effectiveness of education. Chapters are designed to bridge the gap between educational research and policy.

6094. Balch, Robert W. & Kelly, Delos H. (U Montana) **Reactions to deviance in a junior high school: Student views of the labeling process.** *Journal of Instructional Psychology*, 1974(Win), Vol 1(1), 25-38. —Conducted a questionnaire study of 105 9th-graders to examine key aspects of the labeling process. Results indicate that Ss clearly believed that the same deviant act would evoke different reactions from their teachers depending on the character of the offending student. Ss also believed that their teachers tended not to offer constructive help to boys defined as troublemakers. Ss believed that troublesome students were subjected to various practices which would probably further alienate them from the educational system. (27 ref)—*Journal abstract*.

6095. Bassin, William M. (Shippensburg State Coll) **A note on the biases in students' evaluations of instructors.** *Journal of Experimental Education*, 1974(Fal), Vol 43(1), 16-17.—Demonstrated that a significant pattern of bias is discernable in students' evaluations of instructors—low grades and a high level of quantitative content lead to low evaluation scores, and vice versa.

6096. Borg, Walter R. & Stone, David R. (Utah State U) **Protocol materials as a tool for changing teacher behavior.** *Journal of Experimental Education*, 1974(Fal), Vol 43(1), 34-39.—Studied changes in teacher behavior brought about by training with the Utah State University (USU) Protocol Modules. 19 inservice elementary teachers were studied using a single group pretest-posttest design. Teachers made statistically significant gains in 5 of the 7 specific behaviors covered in the training materials. Gains related to protocol materials training were compared with gains related to minicourse training on 6 of the 7 variables where comparable data were available. The 2 instructional models brought about similar gains on most of the behaviors compared. It is concluded that the simpler protocol model is as effective as the minicourse model for changing simple, clearly defined teacher behaviors.—*Journal abstract*.

6097. Comer, James P. (Yale U, Child Study Ctr) **The black American child in school.** In E. J. Anthony & C. Koupernik (Eds), *The child in his family: Children at psychiatric risk: III*. New York, NY: John Wiley & Sons, 1974. xxi, 547 p.—Traces the growth of differential treatment of education in the US as it serves to increase the vulnerability of black youth.

6098. D'Alonzo, Bruno J. (Northern Illinois U, Programs for the Mentally Retarded) **Perceived role behavior expectations of Full-Time Work-Study Program Coordinators.** *Education & Training of the Mentally Retarded*, 1974(Oct), Vol 9(3), 131-133.—Surveyed 4 selected reference groups ( $N = 177$  respondents) to determine significant differences in perceived role expectations for Full-Time Work-Study Program Coordinators (FTCs) of educable mentally retarded youth. A 63-item instrument (FTC Behavior Scale) was developed for the survey. Data were analyzed by (a) ranking of items by per cent of agree responses and (b) a chi-square statistical technique to determine significant differences at the .05 level. Data analyses revealed the respondent groups differed regarding 4 of the items within the instrument.—*Journal abstract*.

6099. Drumbheller, Sidney J. (Drake U) **Competency based teacher education must emphasize fewer and more global behaviors to maximize efficiency and morale.** *Educational Technology*, 1974(Mar), Vol 14(3), 5-11.—Proposes an alternative to competency-based teacher education: training programs which emphasize fewer atomistic behavioral objectives in favor of more global behaviors. Rather than defining many small competencies and expecting the teacher-candidate to integrate them into an effective teaching style, the prospective teacher should concentrate on role-playing until an appropriate teaching style has been identified. Then behaviors should be brought under cognitive control. Teacher education programs using a global focus will be more relevant, more productive, more intuitive, and more easily managed than traditional competency-based approaches.—C. B. Kreitzberg.

6100. Echewa, W. Whittier. (School District of Philadelphia, PA) **Balancing theory with practice: A hypothetical model.** *Education & Training of the Mentally Retarded*, 1974(Oct), Vol 9(3), 157-162.—Suggests that special education departments could offer a 2-session early involvement course at the freshman or sophomore university level to allow special education students the opportunity to become actively involved with retarded and nonretarded children while simultaneously testing their assumed aptitudes. Detailed outlines of the 2 suggested sessions are included.

6101. Erben, Michael. **Teachers' views of the role of liberal studies in a technical college curriculum.** *Research in Education*, 1974(May), No 11, 31-41.—Studied the possible application of deviance studies to organization studies on educational sociology. However, interviews with university faculty and staff indicate that data obtained for this purpose was also used effectively to obtain information about curriculum content.

6102. Forrer, Stephen E. (U Maryland, Counseling & Personnel Services) **Dissemination systems in university orientation: An experimental comparison.** *Journal of College Student Personnel*, 1974(Sep), Vol 15(5), 394-399.—Compared 2 types of information dissemination (newsletter and a 1-day orientation program) for parents using 3 criteria—factual knowledge, attitudes, and perceptions of the university environment. Results show that different systems of information dissemination have differential effects on parents of incoming freshmen, with the newsletter being more effective in providing factual knowledge and the orientation program being more effective in increasing awareness of university life.

6103. Green, Robert L. (Michigan State U, Coll of Urban Development) **Public schools and equal educational opportunity.** *Journal of Non-White Concerns in Personnel & Guidance*, 1974(Jul), Vol 2(4), 198-207.—Discusses problems surrounding equal education in America. A 2-pronged attack on the problem is suggested: (a) reeducating the existing teaching force and (b) completely overhauling teacher-training programs. (26 ref)

6104. Greenwood, Charles R.; Hops, Hyman; Delquadri, Joseph & Guild, Jacqueline. (U Oregon) **Group contingencies for group consequences in classroom management: A further analysis.** *Journal of Applied Behavior Analysis*, 1974(Fal), Vol 7(3), 413-425.

—The relative effects of rules, rules plus feedback, and rules plus feedback plus group and individual consequences for appropriate behavior were investigated in 3 classrooms containing a total of 68 children in Grades 1-3 during reading and mathematics periods. The consequences were individual and group praise, and group activities. The total intervention package (rules plus feedback plus group and individual consequences) was most effective in increasing appropriate behavior. Rules plus feedback produced increased appropriate behavior in 2 of the 3 classrooms. Rules alone produced no change in classroom behavior. Maintenance of appropriate classroom behavior was noted approximately 3 wks after the program ended. Teacher's correct use of praise was also maintained for 2 of the 3 teachers at levels generated during the total package condition. (26 ref)—*Journal abstract*.

6105. Gullotta, Thomas P. (Youth Resource Ctr, Glastonbury, CT) **Teacher attitudes toward the moderately disturbed child.** *Exceptional Children*, 1974(Sep), Vol 41(1), 49-50.—Used 50 student or full-time teachers to assess teacher attitudes and expectations in treating an acting-out male youngster. In response to 10 suggested solutions, Ss selected those that required service outside the described school structure. Ss indicated a desire to keep the youngster in class if assistance was available.

6106. Hamilton, David & Delamont, Sara. (U Glasgow, Scotland) **Classroom research: A cautionary tale.** *Research in Education*, 1974(May), No 11, 1-15.—Describes American interaction analysis and anthropological classroom research. Suggestions for the future development of classroom research in Britain are provided. (42 ref)

6107. Harrington, Charlene. (U California, Berkeley) **Experiences with pass/not pass grading: Student view.** *Journal of College Student Personnel*, 1974(Sep), Vol 15(5), 376-382.—Data from 1,205 undergraduates' responses to a questionnaire on the pass/not pass grading option indicate that the majority favored this grading option but opposed grading in general. Ss with a vocational orientation preferred traditional letter grading, while those who were "identity seekers" preferred grading options.

6108. Harrington, Charlene. (U California, Berkeley) **Experiences with pass/not pass grading: Faculty view.** *Journal of College Student Personnel*, 1974(Sep), Vol 15(5), 383-388.—Data from 256 faculty members' responses to a questionnaire on pass/not pass grading option indicate that although the majority favored the structure, purposes, and operation of this grading option, they preferred limited use of it by students. Faculty members most opposed to the option were older, higher-ranking, and held positions in the fields of chemistry, engineering, and business.

6109. Heltzmann, Ray & Staropoli, Chuck. (Villanova U) **The elementary teacher preparation program: A graduated clinical approach to the education sequence.** *Journal of Instructional Psychology*, 1974(Win), Vol 1(1), 23-24.—Discusses the advantages of an approach in which experiences with various instructional modes and settings are emphasized at the sophomore and junior levels of training. It is suggested that such an approach

would lead to a more desirable student-teaching internship and consequently to a better classroom teacher.

6110. Hilliard, Asa G. (California State U, School of Education, San Francisco) **The intellectual strengths of black children and adolescents: A challenge to pseudoscience.** *Journal of Non-White Concerns in Personnel & Guidance*, 1974(Jul), Vol 2(4), 178-190.—Focuses on the implications of the research literature pertaining directly to the black child and adolescent. 2 principal topics are treated: (a) educational research and some of its weaknesses are discussed, including sample bias, inaccurate data, and irrelevant variables; and (b) unexplained growth and intellectual strength, are examined, including a sampling of studies or projects that show the extent to which blacks in certain environments have made significant achievements. (36 ref)—*M. E. Pounsel*.

6111. Husén, Torsten. (U Stockholm, Sweden) **Multi-national evaluation of school systems: Purposes, methodology, and some preliminary findings.** *Scandinavian Journal of Educational Research*, 1974, Vol 18(1), 13-39.—Discusses historical developments in international education and different methodological problems in performing empirical cross-national comparative research. The organization of international research, the construction of international achievement tests in certain subject areas, and certain teacher variables in international research are also examined. (5 p ref)

6112. Hussell, Ivan & Smithers, A. **Changes in the educational opinions of student teachers associated with college experience and school practice.** *Research in Education*, 1974(May), No 11, 43-50.—Studied 73 female teacher training students to determine the extent of change in educational opinions before and after teaching practice and college experiences. Ss were evaluated for changes in tender-mindedness, radicalism, and naturalism. Results show that over the 6-mo period, Ss became significantly less tender-minded and more radical in their educational opinions. Analyses of teaching practice and college experiences indicate that the increase in tough-mindedness was associated with the teaching practice period and the increase in radicalism with the college experience. It is suggested that these findings are the outcome of a program of teacher training where practicality is emphasized. (20 ref)—*M. E. Pounsel*.

6113. Kehle, Thomas J.; Bramble, William J. & Mason, Emanuel J. (Kent State U) **Teachers' expectations: Ratings of student performance as biased by student characteristics.** *Journal of Experimental Education*, 1974(Fal), Vol 43(1), 54-60.—Studied expectations of 96 5th-grade teachers on general personality variables as well as an achievement variable. The influence of 4 independent variables (sex, race, intelligence, and attractiveness) on expectations was investigated using a multivariate analysis of variance design and the Teacher Rating Form of the Barclay Classroom Climate Inventory. Teachers were given fictitious descriptions of students and then asked to rate student personality characteristics and essay performance. Significant effects were attributed to the sex of the student, the Sex  $\times$  Attractiveness interaction and the 4-way interaction. It is concluded that expectations teachers hold for elementary students are extremely complex and are based on a combination of student characteristics. (17 ref)—*Journal abstract*.

6114. Knotek, Stefan. (Faculty of Pedagogy, Nitra, Czechoslovakia) [Systemological and regulative aspect of the educational process.] (Czec) *Jednotná Škola*, 1974(Jun), Vol 26(6), 505-514.—Argues that scientific management of the educational process assumes the realization of its functional and dialectical analysis. The teacher, as the regulating factor of the educational system, must be prepared to fulfil the requirements of pedagogical and psychological analysis and diagnosis of the student. The constant feedback between the teacher as the subject of the educational process and the pupil as its object achieves changes in the pupil in the direction set by the stated aims of the educational system. Addition of the factor of a teaching machine or teaching program strengthens the control and regulation of the system. (Russian summary)—*English summary*.

6115. Kontiainen, Seppo. (U Helsinki, Finland) **Authoritarian attitudes of supervisors in relation to the effects of supervision as assessed by student teachers.** *Scandinavian Journal of Educational Research*, 1974, Vol 18(2), 79-94.—Analyzed authoritarian attitudes of supervisors in relation to effects of supervision on personal development of student teachers, as assessed by the student teachers themselves. The study is a continuation of earlier research by S. Kontiainen (see PA, Vol 52:3934). Questionnaire data were obtained from 95 female and 94 male student teachers on their assessment of 32 supervisors. Methods of factor analysis and control analysis were applied to the data. Results are interpreted to mean that how authoritarian attitudes are experienced by student teachers depends on other characteristics of supervisor behavior in combination with these attitudes. The analyses show that authoritarian attitudes tend to result in negative—or at best neutral or moderate—effects of supervision.—*Journal abstract*.

6116. Koskenniemi, Matti. (U Helsinki, Finland) **The instructional process and realization of curriculum planning reports from the DPA Helsinki.** *Scandinavian Journal of Educational Research*, 1974, Vol 18(3), 101-116.—Presents a taxonomical instrument for description of instructional processes which is based on the results of triple coding of 174 lessons with systems developed by R. F. Bales, A. A. Bellack, and N. A. Flanders and on logic and concept analysis. The necessity to have continuous chains of instructional situations as targets and the inclusion of goal variables into the paradigm are emphasized. (18 ref)

6117. Lerner, Janet W. & Schuyler, James A. (Northeastern Illinois U) **Computer simulation: A technique for training educational diagnosticians.** *Journal of Learning Disabilities*, 1974(Oct), Vol 7(8), 471-476.—Describes a method of training learning disabilities specialists, using the diagnosis of computer-simulated cases by the trainees as a supplement to regular practicum experience, thus bridging the gap between courses in theory and actual clinical practice.

6118. Lundgren, Robert E. & Shavelson, Richard J. (Temple City Unified School District, CA) **Effects of listening training on teacher listening and discussion skills.** *California Journal of Educational Research*, 1974(Sep), Vol 25(4), 205-218.—Investigated R. E. Snow's (1968) model of cognitive events in teacher-learner interaction at the input state. 60 teacher interns

completing their training were selected. The ability to use key words in summarization of a discussion was used as the most reliable measure of listening. Results suggest that listening skills (the teacher's ability to extract information completely and accurately) can be improved through training. (24 ref)—*Journal abstract*.

6119. Matsuda, Michihiro. [Psychological analysis of the teaching processes in the primary school: II.] (Japn) *Japanese Journal of Educational Psychology*, 1973(Sep), Vol 21(3), 181-186.—3 arithmetic teachers with different amounts of teaching experience taught 3 different classes of 4th graders the same unit of subject matter. Teaching and learning activities were videotaped, and 6 Os recorded and classified children's activities on a 45-item scale. Teacher-pupil interaction was classified according to its duration and frequency. The pre- and posttests of pupil achievement were compared. The teacher with the longest teaching experience used the teacher-centered approach, spent more time in individualized instruction, and scored highest on the posttest of pupil achievement. (18 ref)—S. Choe.

6120. Muller, Mary. **Visual anthropology in teacher education.** *Audiovisual Instruction*, 1974(Oct), Vol 19(8), 30-33.—Describes a teacher education course in Latin America which utilized the rationale and techniques of visual anthropology as part of an effort to develop instructional materials and to offer the students field practice in empirical research. Skills developed through photography of children in the street and in rural villages are described.

6121. Neely, George. (U Michigan, Medical School, Mental Health Research Inst) **Evaluation of the consultation process in schools.** *Professional Psychology*, 1974(Aug), Vol 5(3), 299-302.—Explains the philosophy and methods of the Educational Change Team, a "multidisciplinary multiparty advocacy" educational consultant group. The group recognizes and explores the differing goals of different groups within educational systems, emphasizing input from students and minority group members. Their major goals are ending institutional racism and promoting youth interests. Accountability to the client is stressed as the major form of evaluation.—C. Wright.

6122. Oliver, Lincoln I. (US DHEW, National Ctr for Health Statistics, Rockville, MD) **Behavior patterns in school of youths 12-17 years.** *Vital & Health Statistics, Series 11*, 1974(May), No 139, 50 p.—Presents estimates of the distributions of perceptions of teachers and other school officials on selected behavioral characteristics of youths 12-17 yrs of age in the noninstitutional US population by age and sex. Findings are based on questionnaire responses of Ss in the Health Examination Survey of 1966-1970. A descriptive analysis was made of teachers' responses concerning youths' intellectual ability, academic performance, peer relations, and emotional adjustment to school. Specific behavioral patterns are examined in relation to assessments of mental development, school achievement, and adjustment. Data indicate that adolescent girls are more successful than boys, particularly in terms of adjustment to the specific environment; these findings are consistent with other data which show that girls achieved higher scores on tests of school achievement even though boys had higher

scores on tests of intellectual development. (16 ref)  
—*Journal summary.*

6123. **Parsonson, Barry S.; Baer, Ann M. & Baer, Donald M.** (U Waikato, Hamilton, New Zealand) **The application of generalized correct social contingencies: An evaluation of a training program.** *Journal of Applied Behavior Analysis*, 1974(Fal), Vol 7(3), 427-437.—2 female aides operating a kindergarten-style program for 6 institutionalized mental retardates (mean age = 9.4 yrs) were trained, using O feedback, to apply generalized correct social contingencies to 10 defined classes of appropriate and inappropriate child behaviors. A multiple baseline design was used to demonstrate, sequentially, the effects of the training procedure upon the attending behavior of each aide. After withdrawal of feedback, a posttraining follow-up assessed the durability of training. It was found that training increased the proportion of appropriate child behaviors to which both aides attended, compared with baseline data, and a follow-up over a number of weeks indicated that the effects of training were apparently durable.—*Journal abstract.*

6124. **Pascarella, Ernest T.** (Syracuse U, Ctr for Instructional Development) **Students' perceptions of the college environment: How well are they understood by administrators?** *Journal of College Student Personnel*, 1974(Sep), Vol 15(5), 370-375.—Studied the accuracy of administrators' descriptions of the college environment in comparison with student perceptions. 2 groups of 109 student personnel administrators and administrative staff from 2 large, private universities and 483 freshmen and 410 seniors completed a semantic differential rating of the concept "this university" for 27 bipolar adjectives. A factor analysis yielded 3 factors—Intellectual and Creative Dynamism, Bureaucracy, and Aesthetic Idealism which accounted for about 58% of the variance. Student and administrator responses differed significantly on the 1st 2 factors. Administrators projected students as viewing the environment significantly higher in terms of intellectual stimulation and significantly lower in terms of bureaucracy than students did. No significant differences between the perceptions of administrative subgroups (e.g., department chairmen or academic affairs heads) were found.—*L. Gorsey.*

6125. **Pfeifer, C. Michael & Schneider, Benjamin.** (Westinghouse Behavioral Safety Ctr, Columbia, MD) **University climate perceptions by black and white students.** *Journal of Applied Psychology*, 1974(Oct), Vol 59(5), 660-662.—Studied the perceptions of university climate of 138 black and 730 white undergraduates. Factor analyses of a 115-item university climate questionnaire were performed in racial subgroups. 5 factors were extracted for whites and 6 for blacks. 2 racism factors appeared in the black sample, while only 1 racism factor appeared in the white sample. There were consistent and significant differences on the factor scales between the 2 races, with blacks perceiving the university climate more negatively.—*Journal abstract.*

6126. **Popham, W. James et al.** (U California, Los Angeles) **Performance tests for instructional developers: An exploratory investigation.** *Educational Technology*, 1974(Mar), Vol 14(3), 57-61.—Describes the development and implementation of an assessment instrument

for evaluating the competency of instructional developers. A performance test strategy was adopted in which the developer was given a specific instructional objective and the background required to prepare materials to be administered to learners. The competence of the developer was determined by the effectiveness and learner appeal of the material developed. Results were sufficiently encouraging to warrant additional studies.—*C. B. Kreitzberg.*

6127. **Rowe, Mary B.** (U Florida, Inst for Development of Human Resources) **Pausing phenomena: Influence on the quality of instruction.** *Journal of Psycholinguistic Research*, 1974(Jul), Vol 3(3), 203-224.—Investigated the consequences of manipulating 2 species of "wait-time" on the development of language and logic in 36 children in elementary science programs. When wait-time of 3-5 sec was achieved through training, analysis of more than 900 tapes shows changed values on 8 student variables: (a) the length of response (number of words) increased, (b) the number of unsolicited but appropriate responses increased, (c) failures to respond decreased, (d) incidence of speculative responses increased, (e) incidence of student-student comparisons of data increased, (f) incidence of evidence-inference statements increased, (g) frequency of student-initiated questions increased, and (h) the variety in type of verbal moves made by students increased. Servochart plots of recordings show that students discussing science phenomena tended to speak in bursts, with intervals of as much as 3-5 sec between bursts being fairly common provided they were not interrupted. 2 teacher variables changed—response flexibility scores increased and teacher questioning patterns became more variable.—*Journal abstract.*

6128. **Scott, Harry V.** (West Virginia State Coll, Div of Teacher Education) **Levels of involvement: A descriptive model for teacher education.** *Educational Technology*, 1974(Mar), Vol 14(3), 48-52.—Proposes a model which outlines the logical steps from an undergraduate student beginning a teacher education program to an autonomous classroom teacher. The model describes 7 levels of involvement with representative activities at each level. The emphasis is on progressively greater personal involvement. There are at least 4 dimensions to teacher education—instructional, personal, professional, and community involvement. The proposed model, although centering around the instructional dimension, is comprehensive enough to fit the other 3 dimensions as well.—*C. B. Kreitzberg.*

6129. **Short, Byrl G. & Szabo, Michael.** (Penfield Central Schools, NY) **Secondary school teachers' knowledge of and their attitudes toward educational research.** *Journal of Experimental Education*, 1974(Fal), Vol 43(1), 75-78.—Investigated relationships among secondary teachers' attitude toward and knowledge of educational research and selected demographic characteristics. 204 teachers completed the Short Knowledge of Educational Research Test, a semantic differential attitude inventory, and a personal data form. Results show that (a) knowledge and attitude scores are related to subject area taught; (b) knowledge scores are related to subject area taught, recency of course work in educational research, measurement, or statistics, and

research participation; (c) attitude and knowledge scores are unrelated to the sex of the teacher, years of teaching experience, and grade level taught; and (d) the correlation between knowledge and attitude scores is not significantly different from zero.—*Journal abstract.*

6130. Sorotzkin, Feige; Fleming, Elyse S. & Anttonen, Ralph G. **Teacher knowledge of standardized test information and its effect on pupil I.Q. and achievement.** *Journal of Experimental Education*, 1974(Fal), Vol 43(1), 79-85.—Studied the effects on pupil performance of providing 2nd grade teachers with either IQ test information, achievement test information, IQ and achievement test information, or no test information within the context of teachers' views toward testing. Analyses of covariance of final IQ and achievement test scores (Kuhlmann-Anderson IQ Tests and Stanford Achievement Test) for 567 2nd graders in 23 classes revealed that there were no significant differences as a function of the type of test information distributed to the teachers. 2nd-graders whose teachers and high-middle opinions of tests scored significantly higher on final vocabulary and arithmetic achievement tests than did students whose teachers had low opinions of standardized tests. Significant sex differences in test results were also observed. (19 ref)—*Journal abstract.*

6131. Startup, Richard. (University Coll Swansea, Wales) **Why students wish to reform university government.** *Research in Education*, 1974(May), No 11, 69-82.—Surveyed 321 university students to assess attitudes about the university and its political structure. Results indicate that (a) one-fourth of the Ss felt that "radical changes" should take place in the university's political structure, (b) 1 out of 10 generally wanted more student participation (one-third listed specific dissatisfactions), (c) slightly more than two-fifths felt that occupational expectations had been met, and (d) personal and social expectations were fulfilled for between one-half and three-fourths of the Ss. It is suggested that the "reformer" is the student who is intellectually and personally dissatisfied.—*M. E. Pounsel.*

6132. Turner, Paul R. (U Arizona) **Why Johnny doesn't want to learn a foreign language.** *Modern Language Journal*, 1974(Apr), Vol 58(4), 191-196.—Presents anthropological reasons for the high rate of drop-out and resistance in foreign language courses. It is argued that successful foreign language learning requires identification with the foreign culture, but democratic pressures toward cultural homogeneity in the US entail a negative evaluation of ethnicity, therefore, any identification with US immigrant cultures is rejected.—*C. A. Sherrard.*

6133. Webster, William J. & Mendro, Robert L. (Dallas Independent School District, TX) **The investigation of aptitude-treatment interactions as an integral part of program evaluation.** *Journal of Experimental Education*, 1974(Fal), Vol 43(1), 86-91.—One of the primary objectives of public education in the 1970's is that of meeting the educational needs of all children through individualization. Despite this goal, little information concerning individual differences in learners is currently available. A schema for the systematic investigation of individual differences in learning through the use of aptitude-treatment interaction studies is outlined,

which also provides an approach to incorporating these studies into an ongoing evaluation system. (34 ref)—*Journal abstract.*

6134. Wetterström, Magnhild. **Student democracy in Grades 1-6.** *Educational & Psychological Interactions*, 1974(Mar), No 46, 26 p.—Presents results from a series of mapping studies in which headmasters, supervisory teachers, student teachers, and various teacher and student groups expressed their views on co-influence in the school today and in the future. Assessments are reported from teachers and students both at ordinary schools and at more progressive schools. Results indicate a generally positive attitude towards increased student influence but reveal several specific problems that emerged when this attitude was expressed in more concrete terms.—*Journal abstract.*

6135. Zachrisson, Bertil. [Examination and evaluation of student research essays in teacher training within the area of craft and industry.] (Swed) *Pedagogisk-Psykologiska Problem*, 1974(Aug), No 247, 69 p.—Reports results from an examination and evaluation of 457 essays written by student teachers within the area of craft and industry. The purpose of this investigation was twofold: (a) to identify essays of potential use for teacher training and vocational training and (b) to study correlations between essay proficiency and student background data. An organization model and advice to teachers and students on the subject are included. (18 ref)—*English abstract.*

6136. Zarur, Francisco & Velandia, Aquiles. (U Pedagógica Nacional, Bogotá, Colombia) [Relationship of aptitudes, interests, and personality traits with respect to teacher efficiency with students at a school of education.] (Span) *Revista Latinoamericana de Psicología*, 1974, Vol 6(2), 179-196.—Administered Thurstone's Primary Mental Abilities (PMA), the Guilford-Zimmerman Interest Inventory, and the Maudsley Personality Inventory to 60 advanced students of pedagogy, 30 evaluated by training supervisors as very efficient teachers and 30 as very inefficient. Statistically significant differences were obtained in the Verbal Comprehension factor of the PMA and in the Service Category of the Interest Inventory, both in favor of the efficient group. (English summary) (37 ref)—*V. A. Colotla.*

#### Curriculum Development & Teaching Methods

6137. Adams, Wesley J. (U Alberta, School of Household Economics, Edmonton, Canada) **The use of sexual humor in teaching human sexuality at the university level.** *Family Coordinator*, 1974(Oct), Vol 23(4), 365-368.—Discusses the value of using sexual humor as an innovative teaching method in college human sexuality courses. One such course is described—a graduate-level seminar which meets 3 hrs/wk for 13 wks. Both the instructor and the students share responsibility for teaching the course. Sexual humor, as a specific teaching method, is used only during 1 3-hr session; the procedure involves primarily the use of cartoons to illustrate common misconceptions about sexuality, frequent sexual problems, the scientific approach to sexual behavior, and the problem of sexual morality. Sample discussion questions and cartoons are described.—*L. Gorsey.*

6138. Berman, Arthur I. (U Copenhagen, Denmark) **The media-activated seminar.** *Educational Technology*, 1974(Mar), Vol 14(3), 43-45.—Describes the medium-activated seminar, in which an autolecture is led by a student or teaching assistant, followed by an unstructured seminar involving the teacher. Medium requirements, choice, format, and content are discussed, and the way in which this teaching format is combined with other elements in the learning process. Several attitudinal statements by students exposed to media-activated seminars have indicated that graduate students prefer this type of instruction to more conventional methods.—C. B. Kreitzberg.

6139. Besmer, Beverly F. **Loving your environment: A humanistic approach to primary school environmental studies.** *Interpersonal Development*, 1973-1974(Aug), Vol 4(2), 120-132.—Reports concepts and contents of a humanistically oriented primary school environmental education curriculum. The confluence of affective and cognitive learning is considered in influencing student-teacher relationships. A teachers' guide, including illustrative activity plans, is excerpted.

6140. Blizek, William L.; Jackson, Karl & LaVoie, Joseph C. (U Nebraska, Omaha) **Short course vs conventional structures for teaching philosophy.** *Journal of Experimental Education*, 1974(Fal), Vol 43(1), 25-33.—Examined 2 course structures which are suitable for college teaching—lecture/discussion and independent study. Ss were 100 undergraduates enrolled in philosophy of art and social philosophy classes which were designated as either the independent study or the lecture-discussion format. Measures were obtained on acquisition of factual content, attitudes, student motivation, satisfaction, and classroom climate. Factual content increased during the semester, but this increase was a function of course structure and class. Students liked the independent study format better than the lecture-discussion format. Highly motivated students did better in the independent format, while poorly motivated students performed better in the conventional format. Results suggest that students and course structures should be matched in their motivational properties. (24 ref)—*Journal abstract*.

6141. Born, David G. & Davis, Michael L. (U Utah) **Amount and distribution of study in a personalized instruction course and in a lecture course.** *Journal of Applied Behavior Analysis*, 1974(Fal), Vol 7(3), 365-375.—Considers that the rapid proliferation of courses based on F. S. Keller's (1968) Personalized System of Instruction (PSI) calls for a prompt evaluation of the relative costs involved in PSI and more traditional forms of college instruction. To determine the cost in student time required by a course taught with PSI relative to lecture, undergraduates did their studying in a special study center where course materials could be used but not removed. The 63 students in the PSI section spent an average of about 50% more time in the study center (46 hrs) than did the 31 students in the lecture section (30 hrs), but that difference was made up by the lecture students spending an average of 20 hrs attending lectures. Thus, total preparation time was about the same. PSI students scored slightly higher on common course exams, and while college entrance exam scores

correlated highly with course exam scores, study center time was reliably related to course exam score only for PSI students. An analysis of the study records of individual students revealed that PSI produced fairly regular patterns of study by all students, while lecture students varied greatly in their patterns.—*Journal abstract*.

6142. Borton, Terry; Belasco, Leonard & Echewa, Thomas. (Board of Education, Office of Curriculum & Instruction, Philadelphia, PA) **Dual audio TV instruction: A mass broadcast simulation.** *AV Communication Review*, 1974(Sum), Vol 22(2), 133-152.—1st and 2nd graders were given the opportunity to listen to radio instruction coordinated with a TV cartoon. Measurements were made of the extent to which children watched the cartoon, listened to the radio instruction, and learned vocabulary words taught via radio.

6143. Brown, David & Reschly, Daniel. (U Arizona) **The modification of classroom asocial behaviors: Individual vs. group incentives.** *SALT: School Applications of Learning Theory*, 1974(Jul), Vol 6(4), 42-49.—Studied whether an intrinsic classroom motivator (peer influence) in conjunction with extrinsic reinforcement (candy) and punishment (time-out room) was more effective than extrinsic reinforcement and punishment alone in modifying aggressive classroom behavior. Ss were 12 boys and 8 girls, 4 yrs old, in a Head Start classroom. Phases 1 and 3 of the design used candy and time out as reinforcers or punishment with individual children. In Phases 2 and 4 groups of 4 children were reinforced or punished at the end of each hour instead of the individual child. Each phase decreased aggressive behavior from baseline, but in Phases 2 and 4 the reductions were greater. The changes were resistant to extinction in the same manner. It is concluded that very young children can assume responsibility for their personal actions and contribute to the maintenance and control of peer behavior.—D. R. Marina.

6144. Brown, Louis F. (U Iowa, Coll of Education, Div of Special Education) **An analysis of instructional materials.** *Mental Retardation*, 1974(Oct), Vol 12(5), 21-25.—Describes a system for analyzing instructional materials, using J. P. Guilford's (1967) structure-of-intellect model and additional variables. It is suggested that evaluation of these materials is essential because of (a) the increased effort to account for individual learner differences; and (b) mass production of materials, making it difficult for a teacher to determine the worth of a specific instructional item.

6145. Callahan, Carolyn M. & Renzulli, Joseph S. (U Virginia) **Development and evaluation of a creativity training program.** *Exceptional Children*, 1974(Sep), Vol 41(1), 44-45.—Studied the effectiveness of *New Directions in Creativity*, a 3-volume creativity training program. Results from 63 6th graders and their teachers indicate that the program is a valuable resource in the development of creative thinking abilities.

6146. Carrico, Mark & Wood, Robert W. **An evaluation of the influence of Sesame Street on kindergarten achievement.** *Journal of Instructional Psychology*, 1974(Win), Vol 1(1), 2-6.—Compared the goal attainment of 45 kindergartners who viewed Sesame Street with the attainment of 45 Ss who did not view the

program. A test designed for the study was administered before and after the study to the control and experimental groups to measure the effect of Sesame Street relative to the attainment of selected behavioral goals. Results show that Ss who viewed Sesame Street showed significant achievement gains in all areas.—*Journal abstract.*

6147. Carroll, Archie B. & Watson, Hugh J. (U Georgia) Utilizing job enrichment concepts for instructional purposes. *Journal of Instructional Psychology*, 1974(Win), Vol 1(1), 7-11.—Discusses uninteresting, routine, and meaningless class work assignments as possible factors in feelings of monotony, boredom, and apathy among college students. Results of the implementation of job enrichment concepts in a college class indicate that students responded with greater interest and enthusiasm and with higher quality performance.

6148. Cundick, Bert P.; Gottfredson, Douglas K. & Willson, Linda. (Brigham Young U) Changes in scholastic achievement and intelligence of Indian children enrolled in a foster placement program. *Developmental Psychology*, 1974(Nov), Vol 10(6), 815-820.—Attempted to determine whether Indian students participating in a foster home placement program would show educational gains greater than those previously found with other Indian education programs. 84 children who had been enrolled for 5 or more yrs were selected as Ss and their standardized testing records obtained from the schools. The tests, administered when the Ss were 8-14 yrs old, included the Iowa Test of Basic Skills and California Test of Mental Maturity. Although testing records were incomplete, it was found that compared to national norms, the mean achievement score for this group declined with successive yrs of participation in the program and total IQ scores showed no significant changes. It is concluded that results are similar in this respect to those obtained on Indian students who remain at home and are educated in public schools. (22 ref)—*Journal abstract.*

6149. Erickson, Marilyn R. & Howell, John F. (Springfield Public Schools, MA) Summer program helps pre-schoolers. *Journal of Instructional Psychology*, 1974(Win), Vol 1(1), 39.—Used the Peabody Picture Vocabulary Test to assess the development of 110 preschoolers enrolled in a summer program. Results support the hypothesis that the program would significantly help the children.

6150. Findley, Warren G. (U Georgia) Grouping for instruction. In L. P. Miller (Ed), *The Testing of black students: A symposium*. Englewood Cliffs, NJ: Prentice-Hall, 1974. x, 113 p.—Discusses theoretical, empirical, and practical reasons for the unsoundness of the ability grouping system in schools, especially as it affects black children. The effects of ability grouping programs on academic performance and self-concepts in black children and more profitable alternatives to this system (e.g., peer tutoring) are discussed.

6151. Flowers, John V. (U California, Program in Social Ecology, Irvine) Behavior modification technique to reduce the frequency of unwarranted questions by target students in an elementary school classroom. *Behavior Therapy*, 1974(Oct), Vol 5(5), 665-667.—After a 3-wk token-reinforcement treatment, 8 5th graders

significantly decreased their unwarranted questions and significantly increased their warranted questions. 21 Ss not in treatment also significantly increased their frequency of warranted questions, indicating that the change in the target Ss actually changed the entire classroom system.

6152. Galey, Minaruth & George, Kenneth D. (Temple U, Coll of Education) Development of skills of classification using television. *AV Communication Review*, 1974(Sum), Vol 22(2), 153-166.—The effectiveness of TV science instruction coupled with the use of science kit materials was tested with 1st graders. Results indicate no difference between TV and classroom lessons in developing classification skills.

6153. Hammill, Donald D. & Larsen, Stephen C. The effectiveness of psycholinguistic training. *Exceptional Children*, 1974(Sep), Vol 41(1), 5-14.—Reviewed the results of 38 studies which attempted to train children in psycholinguistic skills and which used the Illinois Test of Psycholinguistic Abilities as the criterion of improvement. It is concluded that the effectiveness of such training has not been conclusively demonstrated and, therefore, that the rapid expansion of psycholinguistic training programs seems unwarranted. (56 ref)—*Journal abstract.*

6154. Henderson, Ronald W. & Swanson, Rosemary. (U Arizona, Tucson) Application of social learning principles in a field setting. *Exceptional Children*, 1974(Sep), Vol 41(1), 53-55.—Evaluated the effectiveness of modeling and reinforcement procedures on the development of question-asking skills in 30 Papago native Americans. Results show that although all groups made significant improvement, improvement was greater for treated groups.

6155. Hillelsohn, Michael J. (Human Resources Research Organization, Eastern Div, Alexandria, VA) Student initiated reports: Operational analysis in the evaluation of CAI curricula. *HumRRO Professional Paper*, 1974(Sep), No 15-74, 23 p.—Defines operational analysis as a part of formative evaluation taking place while a course is in progress. In Project IMPACT, student-perceived problems, as reflected by student-initiated reports, are the source of data for this phase of formative evaluation. The self-reporting techniques can reveal individual differences in student-learning-environment interactions which are not obtainable by other means. The individual student's perceptions can then be used to improve the instructional program. Applications of the data for administrative purposes are discussed, and administrative staffing for the IMPACT operational computer-assisted instruction (CAI) course is described. (21 ref)—*Journal abstract.*

6156. Hollander, Carl E. (Colorado Ctr for Psychodrama, Sociometry & Sociatry, Denver) Role playing: An action learning process. *Handbook of International Sociometry*, 1973, Vol 7, 88-93.—Describes and discusses conditions under which role playing can contribute to the teaching-learning process in early school-age learners. Several important steps are outlined which are necessary if the role-playing experience is to be a positive one. Role-playing situations applicable to classes in history, English literature, developmental anatomy, social studies, mental health, mathematics, social issues,

and the biological sciences are listed and described.—R. J. Ambrosino.

6157. Jakobovits, Leon A. (U Hawaii) **Transactional engineering analysis and foreign language teaching: A reply to Ney.** *Modern Language Journal*, 1974(Apr), Vol 58(4), 201-203.—Replies to an article by J. W. Ney (see PA, Vol 53:Issue 3) which criticized the ambivalence of foreign language teaching theorists toward behaviorist and cognitive linguistic theories. The abandonment of psychological theories of language in favor of sociolinguistic and transactional analysis as the theoretical foundation of foreign language teaching practice is proposed.

6158. Leviton, Dan & Forman, Eileen C. (U Maryland, Adults' Health & Developmental Program) **Death education for children and youth.** *Journal of Clinical Child Psychology*, 1974(Sum), Vol 3(2), 8-10.—Presents some observations on education about death, especially for the elementary school child and the college student. The educator must know the background and motivation of students in such classes. Methods in death education and emotional barriers are discussed. It is recommended that death education be given, but only by thoroughly trained personnel.—A. Krichew.

6159. Mercer, G. (U Leeds, England) **Are we being fair to political education in the school?** *Research in Education*, 1974(May), No 11, 51-67.—Studied 389 English adolescents to determine the impact of a political education course on their political attitudes. Ss were administered questionnaires at the beginning and end of the school year. Results indicate that the political education course did little to alter existing trends in Ss' political learning. Where improvement was linked with the course, it tended to be commensurate with the original growth rate achieved by the individual. (23 ref)—M. E. Pounsel.

6160. Mercurio, Joseph A. (U Otago, Dunedin, New Zealand) **Caning: Educational ritual.** *Australian & New Zealand Journal of Sociology*, 1974(Feb), Vol 10(1), 49-53.—Carried out a study of corporal punishment, using the method of participant observation, in a high school in Christchurch, New Zealand, which had a staff of 45 masters and an enrollment of 1,100 boys 13-17 yrs old. Observations indicate that caning is a ritual which serves as a thermostat. It tries to keep the system in balance and to maintain the values of discipline, manliness, and egalitarianism. Other considerations include the attempt to force upon the ritual more than it can bear, the persistence of the ritual in the threat of change, and its acceleration of need before its inevitable demise.—*Journal summary.*

6161. Mullahy, Thomas E. (Pathway School, Jeffersonville, PA) **The genesis of mathematical awareness.** In R. Hyatt & N. Rolnick (Eds), *Teaching the mentally handicapped child*. New York, NY: Behavioral Publications, 1974. vii, 337 p.

6162. Ney, James W. (Arizona State U) **Contradictions in theoretical approaches to the teaching of foreign languages.** *Modern Language Journal*, 1974(Apr), Vol 58(4), 197-200.—Points out a contradiction in the writings of foreign language teaching theorists, who espouse the cognitive linguistic theory of

N. Chomsky, but recommend behaviorist-based drill and pattern practice in teaching.

6163. O'Connell, Michael. (Helen Ross McNabb Ctr, Knoxville, TN) **Immediate feedback, delayed feedback, and perceptual cues and inquiry during verbal interactions.** *Journal of Counseling Psychology*, 1974(Nov), Vol 21(6), 536-538.—Evaluated the effectiveness of diverse ways of teaching an interpersonal inquiry technique. Using 5 experimental groups of male undergraduates and a videotape technique, the impact of delayed feedback, immediate feedback, and perceptual cues was separated. When Ss were exposed to delayed feedback plus perceptual cues, they learned at a significantly higher level than when receiving immediate feedback.—*Journal abstract.*

6164. Peters, Marie F. (U Connecticut) **The black family: Perpetuating the myths: An analysis of family sociology textbook treatment of black families.** *Family Coordinator*, 1974(Oct), Vol 23(4), 349-357.—Considers that a serious issue in the family sociology field is the inadequacy of both research and textbooks in the treatment of black American families. The contemporary view of the black family usually emphasizes concepts of deviancy, pathology, and/or uncontrolled sexuality. College family sociology textbooks in the family sociology field are analyzed to demonstrate how all family sociology textbooks should be examined as to their treatment of black family literature. Most are found to be inaccurate and unacceptable; only a few meet acceptable criteria. A guide is presented for evaluating college family sociology textbooks. (37 ref)—*Journal abstract.*

6165. Placek, Robert W. (U Georgia) **Design and trial of a computer-assisted lesson in rhythm.** *Journal of Research in Music Education*, 1974(Spr), Vol 22(1), 13-23.—Describes development of a computer-assisted lesson in rhythm perception, designed for students in elementary education, using TUTOR language and the PLATO III system.

6166. Prince, Warren F. (Case Western Reserve U) **Effects of guided listening on musical enjoyment of junior high school students.** *Journal of Research in Music Education*, 1974(Spr), Vol 22(1), 45-51.—Divided 342 7th graders and 5 California schools into 3 groups. Group 1 received 12 tape-recorded narrated lessons on baroque music over a 3-mo period. Group 2 received 12 similar lessons on 20th century music. Group 3, controls, received only the regular general music lessons. Liking for specific styles of music was not affected either by the special training materials and methods or by general music classes.—D. S. Higbee.

6167. Romanek, Mary L. (Pennsylvania State U, McKeesport) **A self-instructional program for musical concept development in preschool children.** *Journal of Research in Music Education*, 1974(Sum), Vol 22(2), 129-135.—Studied 42 preschoolers at a state university nursery school. Data indicate that Ss showed significant learning of concepts of loudness, pitch, and duration after 12 20-min self-instructional lessons. A control group with no instruction did not show significant learning.

6168. Ruder, Kenneth F. & Smith, Michael D. (U Kansas, Bureau of Child Research) **Issues in language**

training. In R. L. Schiefelbusch & L. L. Lloyd (Eds), *Language perspectives: Acquisition, retardation, and intervention*. Baltimore, MD: University Park Press, 1974. xv, 670 p \$14.50.—Discusses issues concerned with (a) evaluation and selection of language training programs, (b) content of a language training program, (c) language training procedures, and (d) language assessment. It is stressed that such programs should be able to identify and train both relevant linguistic structures and appropriate environmental situations which call for the use of particular structures. (6 p ref)

6169. Scoresby, A. Lynn; Apolonio, Franklin J. & Hatch, Gary. (Brigham Young U) **Action plans: An approach to behavior change in marriage education.** *Family Coordinator*, 1974(Oct), Vol 23(4), 343-347.—Presents the rationale, methodology, and implications for using action plans to facilitate behavior modification of college students in marriage education courses. Action plans consist of acting to increase or decrease the frequency of a specific unit of overt behavior by identifying what behavior is to be changed, what level of commitment is required to make the change, where help can be obtained, and possible obstacles to change. Case studies are given as illustrations of how action plans may be implemented, and student evaluations of action plans as a teaching tool are reported. It is concluded that planned behavior change can effectively be carried out by students who report greater learning and self-satisfaction.—*Journal abstract*.

6170. Swick, Kevin J. (Southern Illinois U, Carbon-dale) **Developing children's creative talents through media and activities.** *Journal of Instructional Psychology*, 1974(Win), Vol 1(1), 53-56.—Presents examples of creative media activities that correspond to developmental growth stages in children. Suggestions are provided for infant and nursery school, preschool and primary grade, and junior high school children.

6171. Van Hevel, John & Hawkins, Robert P. (Western Michigan U) **Modification of behavior in secondary school students using the Premack principle and response cost technique.** *SALT: School Applications of Learning Theory*, 1974(Jul), Vol 6(4), 31-41.—Applied a simple, economical, self-contained token reinforcement system which increased the amount of time that junior high school students spent attending to their work. During baseline a record was made of the percentage of time each student spent attending to his work. When points, backed up by free time, were delivered contingent upon attending behavior, the percentage of time spent attending increased. When the experimental contingencies were discontinued for a short time, attending behavior decreased. Reinstatement of the procedure again increased the time spent attending. Performance was maintained as reinforcement was delivered less often, and was also maintained on checks made several weeks after the E had left the classroom.—*Journal abstract*.

6172. VanderWiel, Ray & Foley, Bob. (Educational Service Ctr, Cedar Rapids, IA) **Any telephone a dial-access station.** *Educational Technology*, 1974(Mar), Vol 14(3), 54-57.—Describes a system whereby users can obtain access to prerecorded educational materials

through any telephone. Operating cost for the system is estimated at \$.61/hr.

6173. Verreck, W. A. (Ed.). (Eindhoven U of Technology, Educational Research Group, Netherlands) **Methodological problems in research and development in higher education: Proceedings of the Inaugural Congress of the European Association for Research and Development in Higher Education, Rotterdam, December 3-5, 1973.** Amsterdam, Netherlands: Swets & Zeitlinger B. V., 1974. xii, 439 p.—Presents 24 symposium papers on goals and objectives in curriculum construction, new approaches to curriculum evaluation, the implementation of educational innovations, approaches to individualization of instruction, and measurement and individual differences.

6174. Witt, William. (U Wisconsin) **Effects of numerical data upon reading time and recall of scientific writing.** *Journal of Applied Psychology*, 1974(Aug), Vol 59(4), 532-534.—To examine the effects of numerical units upon reading time and recall, 50 university students were exposed to text containing numerical references and 50 were exposed to identical text with descriptive modifiers substituted for the numbers. Numerical data significantly increased reading time but, in the predicted direction, fell short of significance in decreasing recall.

#### Academic Learning & Adjustment & Achievement

6175. Berzonsky, Michael D. & Ondrako, Mary A. (State U New York, Cortland) **Cognitive style and logical deductive reasoning.** *Journal of Experimental Education*, 1974(Fal), Vol 43(1), 18-24.—Conducted 2 studies to analyze the role of reflection in logical deductive reasoning. In Study 1 69 6- and 7-yr-olds were administered a measure of reflectivity (Matching Familiar Figures Test; MFFT) and a logic test involving concrete manipulations. Results indicate that reflectives scored higher than impulsives on the logic test, but the difference was not statistically significant ( $p < .10$ ); fallacy principles were more difficult than the valid ones, and sex differences were nonsignificant. To determine whether the nonsignificant effect of reflectivity in Study 1 was a function of the concrete nature of the logic test, 39 11-yr-olds were administered a verbal measure of logical reasoning and the MFFT in a 2nd study. Suggestive items were more difficult than concrete or abstract ones. Valid principles were less difficult than invalid ones. While reflectives performed better than impulsives on the logic test, the magnitude difference was again nonsignificant. (19 ref)—*Journal abstract*.

6176. Cockriel, Irvin W. (U Missouri) **Sociometric status scores and reading achievement.** *Handbook of International Sociometry*, 1973, Vol 7, 84-87.—Investigated the relationship between social rejection and reading achievement. Ss were 4 6th grade classes in a large suburban school. 2 sociometric status scores were derived, and reading comprehension scores from the Iowa Tests of Basic Skills (ITBS) and the Petriell Reading Comprehension Test (PRCT). Pearson product-moment correlation coefficients were computed between the social status and reading comprehension scores. Results indicate that positive social status was positively correlated with reading comprehension as measured by the ITBS

and PRCT ( $p < .01$ ), and negative social status was negatively correlated with comprehension ( $p < .01$ ). Findings thus confirm earlier research results.—*R. J. Ambrosino.*

6177. **Dahlöf, Urban.** (U Göteborg, Inst of Education, Sweden) Trends in process-related research on curriculum and teaching at different problem levels in educational sciences. *Scandinavian Journal of Educational Research*, 1974, Vol 18(2), 55-77.—Reviews research on the influences of certain environmental factors (e.g., size and characteristics of the school) on student achievement. The data indicate that educational process data are helpful in developing an explanatory model both on the macro-systems level and on the classroom interaction level. 7 promising characteristics of the approach are noted. It is concluded that the findings strongly support claims for a reorientation of educational research. (3½ p ref)—*R. Hall.*

6178. **Fisher, Richard I.** (Colorado State U) **Cognitive appraisal: An examination.** *Journal of Psychology*, 1974(Sep), Vol 88(1), 147-152.—Tested 295 college students to determine the effects of specified variables of self-appraisal and task-appraisal on achievement, self-assessment of achievement, and expended effort. The academic self-concept was found to contribute significantly to achievement on a specific task. A nonsignificant partial correlation between task confidence and task achievement with intelligence controlled was obtained. Approximately two-thirds of the variance in self-assessment of achievement was due to perceived achievement on a specific task. The variables of self-appraisal (i.e., academic self-concept and self-confidence) and task appraisal (i.e., task confidence and task interest) did not affect self-assessment of achievement. Expended effort appears to have had a small part in the total variance of self-assessment of achievement. Expended effort was significantly related to task interest, but variables of self-appraisal did not contribute significantly to expended effort.—*Journal abstract.*

6179. **Flynn, Timothy M.** (Southern Illinois U, Carbondale) **The personality characteristics of school readiness in disadvantaged preschool children.** *Journal of Instructional Psychology*, 1974(Win), Vol 1(1), 45-52.—To determine the characteristics that are related to school readiness, 7 characteristics were examined in 195 3-5 yr olds: (a) delay of gratification, (b) relationship with achievement model, (c) dependency, (d) motor inhibition, (e) self-control, (f) self-concept, and (g) risk-taking. A cognitive ability measure was used as a covariate to remove the purely intellectual factor from the measure of school readiness to insure that the characteristics being examined were of an affective nature. Results of regression analysis indicate that self-concept accounted for a significant percentage of achievement variance for both males and females. Self-control, delay of gratification, and motor inhibition accounted for a significant percentage of variance for males but not for females. However, risk-taking was related to school readiness for females but not for males. (20 ref)—*Journal abstract.*

6180. **Forbes, Gordon B.** (Millikin U) **Birth order and academic behavior among seriously disadvantaged adults.** *Journal of Social Psychology*, 1974(Aug), Vol

93(2), 301-302.—Found no relationship between birth order and attendance in or successful completion of an adult continuing education course among severely disadvantaged adults. Results suggest that previous findings of greatest academic success for firstborns may be applied only to highly advantaged populations.

6181. **Greene, David & Lepper, Mark R.** (Stanford U) **Intrinsic motivation: How to turn play into work.** *Psychology Today*, 1974(Sep), Vol 8(4), 49-54.—Investigated the hypothesis that extrinsic rewards for an activity will lower the value of intrinsic rewards. A replicated study showed that nursery school children used magic markers less often after being rewarded for using them than they did before the reward, and less often than other children who were not rewarded. The use of math-related activities by grade school children was similarly affected. Since there appears to be some sort of trade-off between extrinsic and intrinsic motivation, extrinsic motivation should be used only when there is no intrinsic motivation to lose or when the fundamentals are being learned.—*E. J. Posavac.*

6182. **Jackson, Barry & Van Zoost, Brenda.** (Ontario County Board of Education, Oshawa, Canada) **Self-regulated teaching of others as a means of improving study habits.** *Journal of Counseling Psychology*, 1974(Nov), Vol 21(6), 489-493.—30 undergraduates enrolled in an 8-session study skills program were given exercises throughout the sessions and asked to evaluate their own performance on these tasks and reward themselves with money. 15 Ss were required to teach the contents of each session to a friend and then to self-assess and monetarily self-reinforce their teaching competence. The remaining 15 Ss constituted a non-teaching control. Analysis of variance of scores on the Brown-Holtzman Survey of Study Habits and Attitudes and a specially developed Study Skills Inventory showed that all Ss reported significantly better study habits following the program, with a significant Teaching  $\times$  Program interaction indicating greater gains for the teaching Ss. Ss in both groups showed a significant reduction in Suinn Test Anxiety Behavior Scales scores. (26 ref)—*Journal abstract.*

6183. **Jensen, Reimer.** (Royal Danish School of Educational Studies, Copenhagen) **The risk of going to school.** In E. J. Anthony & C. Koupnik (Eds), *The child in his family: Children at psychiatric risk: III*. New York, NY: John Wiley & Sons, 1974. xxi, 547 p.—Suggests that in addition to their positive aspects, schools also expose vulnerable children to experiences that may be detrimental (e.g., the school setting may create feelings of inferiority, teacher's evaluation may undermine the child's enthusiasm and self-confidence, or it may inculcate group attitudes, values, and behavior that create conflicts for the child in his adjustment to his family and community).

6184. **Leon, Gloria R.** (U Minnesota, Lab of Physiological Hygiene) **Personality change in the specially admitted disadvantaged student after one year in college.** *Journal of Clinical Psychology*, 1974(Oct), Vol 30(4), 522-528.—A group of 87 disadvantaged freshmen college students (predominantly black or Puerto Rican) admitted under a special entrance program was compared to a group of 36 regularly admitted freshmen. The

special entrance group showed an inverse relationship between interpersonal trust at the end of the school year and 1st- and 2nd-semester grade-point average. The control group showed a positive relationship between end-of-year interpersonal trust and grade-point average. Those disadvantaged Ss who fared better academically showed more internal locus of personal control at the completion of the freshman year. For the control group at the end of the school year, external control orientation was associated with lower interpersonal trust. The implication of these findings for those who work with minority-group students is discussed.—*Journal summary.*

6185. Maas, James B.; Jayson, Jill K. & Kleiber, Douglas A. (Cornell U) **Effects of spectral differences in illumination on fatigue.** *Journal of Applied Psychology*, 1974(Aug), Vol 59(4), 524-526.—Examined the effects of different spectra of environmental illumination on fatigue after a period of studying. No significant differences in Ss' self-reported states were identified. However, objective measures revealed less perceptual fatigue and better visual acuity under lighting which closely approximated the spectral quality of natural sunlight than under traditional cool-white lighting.

6186. Marciniak, Francis M. (Rhode Island Coll) **Investigation of the relationships between music perception and music performance.** *Journal of Research in Music Education*, 1974(Spring), Vol 22(1), 35-44.—Tested 11th and 12th graders from 6 high school bands participating in the 1969 and 1970 Illinois competition festivals. Data from Schinke's Test of Music Perception, the Drake Musical Aptitude Tests, and academic achievement tests, indicate that music perception was significantly related to music aptitude, academic achievement, ensemble experience, and instruction in music history and music theory. However, music perception was not significantly related to band performance, Ss' major instruments, literature ratings, socioeconomic status, or the background of the band director.—*D. S. Higbee.*

6187. Maudal, Gail R.; Butcher, James N. & Mauger, Paul A. (Hennepin County General Hosp, Minneapolis, MN) **A multivariate study of personality and academic factors in college attrition.** *Journal of Counseling Psychology*, 1974(Nov), Vol 21(6), 560-567.—Performed multiple linear discriminant function analyses using academic, performance, and personality variables to discriminate among groups of transfers, persisters, and dropouts 2 yrs after college matriculation. 273 male and 433 female undergraduates were Ss. Measurements included the Personality Research Form, the MMPI, Block's Ego Control scale, grade point averages, and Scholastic Aptitude Test scores. Discrimination above base rates was obtained with either academic or personality variables. Analysis of all variables combined added no predictive power beyond that by either subset alone. Results held up on cross-validation. (28 ref)—*Journal abstract.*

6188. Moore, J. William & Holmes, Suzy. (Bucknell U) **The effects of verbally controlled success and failure conditions of persistent behavior.** *Journal of Experimental Education*, 1974(Fall), Vol 43(1), 70-74.—Studied the effects of success, failure, and combined success and failure experiences on 3 types of persistent behavior in 72

6th-grade students. Ss were randomly assigned to 1 of 3 treatment groups. Success and failure were defined in terms of verbal comments administered by E after the completion of each anagram list. Ss were trained using anagram lists under 1 of the 3 experimental conditions. Ss experiencing both success and failure during training voluntarily attempted more lists after training ( $p < .10$ ) than Ss experiencing only failure. Ss experiencing only failure performed at a higher level when participation was required but reinforcement was withheld ( $p < .05$ ). Ss' performance was differentially affected as a function of sex, IQ, and treatment during the training period.—*Journal abstract.*

6189. Nordlund, Gerhard. (U Umea, Sweden) **Prediction of success in secondary school studies.** *Scandinavian Journal of Educational Research*, 1974, Vol 18(3), 133-150.—Studied the usefulness of students' present grade point averages in predicting their academic performance in secondary school, compared the prediction value of their average grades to the predictive value of ability and achievement tests, and examined how the selection of pupils can be improved using test and grade data. Data from 1,365 students in 2 levels of the upper secondary school confirm previous findings that prior grade point averages are the best predictors of subsequent academic achievement. This prediction cannot be substantially improved by adding ability and achievement test scores. Social status of the Ss was a significant contribution to the prediction ( $p < .05$ ).—*L. Gorsey.*

6190. Prociuk, Terry J. & Breen, Lawrence J. (U Manitoba, Winnipeg, Canada) **Locus of control, study habits and attitudes, and college academic performance.** *Journal of Psychology*, 1974(Sep), Vol 88(1), 91-95.—Examined the relationship between locus of control and 2 academic-related variables—study habits and attitudes, and college academic performance. 89 college students were administered (a) the Survey of Study Habits and Attitudes; and (b) Levenson's Internal, Powerful Others, and Chance scales, the latter providing separate measures of 2 external control dimensions. Results indicate that internal control was related positively to effective study habits and attitudes and to college academic success, while the opposite was true for powerful others and chance control. Significant differences were found between powerful others and chance control as related to study habits and attitudes and to college grade-point averages.—*Journal abstract.*

6191. Silberman, Harry F. (U California, Los Angeles) **Job satisfaction among students in work education programs.** *Journal of Vocational Behavior*, 1974(Oct), Vol 5(2), 261-268.—Conducted interviews about job characteristics and 6 related variables (feedback availability, task difficulty, stimulus variation, group atmosphere, adult role models, and meaningfulness) with 1,016 students in grades 9-14 from 50 work education programs. 696 similar students who held part-time jobs but were not participating in work education programs also were interviewed. Participating students were significantly more satisfied with their jobs than were the nonparticipating students. Group atmosphere, availability of adult role models, meaningfulness of work roles, and availability of feedback accounted for much of the

variation in job satisfaction among students. (16 ref)  
—*Journal abstract.*

6192. Wilson, J. A. (Queen's U, NICER Research Unit, Belfast, Northern Ireland) **Adjustment in the classroom: II. Patterns of adaptation.** *Research in Education*, 1974(May), No 11, 17-29.—Examined the pattern of linear relationships among 29 indices of pupil adjustment in 300 10-yr-olds. Results suggest that the classroom reflects differential attitudes and expectations towards the educational and social needs of boys and girls. The patterns varied in such a way as to suggest that boys and girls are expected to fulfill distinguishable roles.

### Special Education

6193. ———. **Curriculum in early childhood education: Report of a seminar held from 15-25 November 1972 in Jerusalem.** The Hague, Netherlands: Bernard van Leer Foundation, 1974. 172 p. \$5.50.—Provides the texts of 5 papers presented or used as background documents at the Seminar on Curriculum in Compensatory Early Childhood Education: Disadvantaged Children and Their Early Education, Designing a Relevant Preschool Curriculum, the Curriculum in the Classroom, Compensatory Education for Aboriginal Children in Queensland, and the Athlone Early Learning Center, South Africa.

6194. Anderson, Nancy. (Montgomery County School District, PA) **On the practical side.** In R. Hyatt & N. Rolnick (Eds), *Teaching the mentally handicapped child*. New York, NY: Behavioral Publications, 1974. vii, 337 p.—Discusses the teacher's role in the use of 4 methods of psychoeducational treatment of handicapped children: chemotherapy, psychotherapy, behavior modification, and specialized educational procedures (e.g., diagnostic and prescriptive teaching). Guidelines for teachers in working with children with specific handicaps and suggestions for activities and evaluation methods are presented. (17 ref)

6195. Apple, Marianne M. (Santa Clara Blind Ctr, San Jose, CA) **Kinesic training for the blind: A program.** *Education of the Visually Handicapped*, 1972(May), Vol 4(2), 55-60.—Attempted to develop a kinesics training program for the congenitally blind adolescent in order to bridge the gap between education or vocational training and the everyday communication and social skills needed by the blind. An experimental program in nonverbal communications utilizing facial expressions and gestures was developed and put into operation with congenitally blind adolescents serving as Ss. Final measurements of the effectiveness of the 6-wk program gave inconclusive results, but feedback from the training suggested that it had been helpful.—C. L. Nicholson.

6196. Bateman, Barbara. (U Oregon) **Discussion summary: Language intervention for the mentally retarded.** In R. L. Schiefelbusch & L. L. Lloyd (Eds), *Language perspectives: Acquisition, retardation, and intervention*. Baltimore, MD: University Park Press, 1974. xv, 670 p. \$14.50.—Critically reviews articles by J. F. Miller and D. E. Yoder, et al (see PA, Vol 53:Issue 3) concerning the relevance of normal language development data and theory to teaching language to retardates.

6197. Bauer, J. R. (Davis Joint Unified School District, Psychological Services & Special Education, CA) **The "therapy" in educational therapy.** *Academic Therapy*, 1972-1973(Win), Vol 8(2), 199-205.—Proposes an ego-coping function model of educational therapy for severely dysfunctional students. The administrative strategies of the model are discussed within the framework of the educational environment, professional consultation for the teacher, and support services available to parents. Teaching model tasks are identified and described to include aspects of the student's academic and socio-emotional growth.—M. E. Blankenship.

6198. Bellamy, G. Tom & Bellamy, Terry T. (U Oregon, Ctr on Human Development) **Descriptive concepts for preschool retarded children.** *Education & Training of the Mentally Retarded*, 1974(Oct), Vol 9(3), 115-122.—Details the direct instruction method, teaching materials, and measurement procedures used in teaching descriptive concepts to 4 4-yr-old retarded boys. All Ss learned correct responding to tasks used during teaching and developed concepts, as evidenced by performance on novel tasks. Replication of the program with 3 2- and 3-yr-old retarded children was equally successful. Results support the view that preschool retarded children can be taught many of the skills with which other children enter public schools.—*Journal abstract.*

6199. Bennett, Clinton W. (McGill U, Montreal, Quebec, Canada) **Articulation training of two hearing-impaired girls.** *Journal of Applied Behavior Analysis*, 1974(Fal), Vol 7(3), 439-445.—Trained 2 4-yr-old hearing-impaired girls to articulate correctly /f/ and /sh/ phonemes in the initial position of words in response to pictures. They were first trained to imitate, and then to respond when asked "what's this?" As a result, both girls generalized correct articulation to words requiring both phonemes in the initial and final positions. (16 ref)  
—*Journal abstract.*

6200. Bloss, Joan W. (U Michigan, School of Education, Early Childhood Education Program) **Rhymes, songs, records, and stories: Language learning experiences for preschool blind children.** *New Outlook for the Blind*, 1974(Sep), Vol 68(7), 300-307.—Describes how traditional nursery literature can play a significant role in developing the language skills of blind preschool children (e.g., introducing the concept of order). Suggested tales and songs are presented, along with hints for their presentation and adaptation to real-life situations. (18 ref)

6201. Dardig, Jill C. (U Massachusetts, Northeast Regional Media Ctr for the Deaf, Amherst) **A visual literacy program for deaf students.** *Audiovisual Instruction*, 1974(Oct), Vol 19(8), 24-27.—Describes a program and materials developed by the Northeast Regional Media Center for the Deaf to teach middle-school-aged deaf children how to communicate using visual media.

6202. Enis, Carol A. & Cataruzolo, Michael. (Perkins School for the Blind, Watertown, MA) **Sex education in the residential school for the blind.** *Education of the Visually Handicapped*, 1972(May), Vol 4(2), 61-64.—Discusses the special problems of sex education of blind children in residential schools, where this issue is just

becoming apparent. The physical development of the blind child takes place at the same rate as that of the non-visually handicapped child. The blind child is deprived of many everyday experiences of learning about the anatomy of the body, the development of sexual characteristics, seeing miniskirts and see-through blouses, pornographic literature, and even watching members of his family walk around in underwear. He must learn primarily by auditory and tactile means. Another problem is the misconception of dimension, texture, and location of the genitals. Most blind students attend schools beyond commuting distance, consequently they have to become residential students and this interferes with possible parent-child communication. Therefore, sex education should be included in every residential school for the blind.—C. L. Nicholson.

6203. Gadberry, Eve P.; Brown, Lou; Shores, Richard E. & York, Robert. (U Wisconsin, Madison) **Use of a stimulus-fading procedure to teach retarded-emotionally disturbed students to discriminate mathematical operations.** *SALT: School Applications of Learning Theory*, 1974(Jul), Vol 6(4), 1-19.—Taught 3 emotionally disturbed educable retarded students to discriminate appropriate mathematical operations. Initially the Ss knew how but not when to add or subtract. A series of stimuli (teacher instructions) and correlated responses culminating in the performance of the criterion response (correct discrimination) was arranged. When the students could perform the criterion response, the verbal instructions were systematically faded. Results indicate that voiced procedure was effective, in that the students learned to discriminate addition and subtraction word problems. (16 ref)—*Journal abstract*.

6204. Gallagher, James J. (U North Carolina, Frank Porter Graham Child Development Ctr) **Education.** In J. Wortis (Ed), *Mental retardation and developmental disabilities: An annual review: VI*. New York, NY: Bruner/Mazel, 1974. xiv, 305 p.—Reviews evidence of 5 current trends in educational developments for the mentally retarded, including the use of the courts to establish and insure the rights of the retarded, the refinement of behavior modification and shaping techniques in teaching the retarded, and a greater interest in early education and intervention programs. (72 ref)

6205. Goodstein, H. A. & Kahn, H. (U Connecticut) **Pattern of achievement among children with learning difficulties.** *Exceptional Children*, 1974(Sep), Vol 41(1), 47-49.—Examined the relationship between scores on the Wechsler Intelligence Scale for Children, Gates-MacGinitie Reading Test, and Science Research Associates Achievement Series: Arithmetic in 50 children with specific learning disabilities. Results show that Ss' arithmetic computation, reading achievement, and measured intelligence were stable and relatively independent.

6206. Guess, Doug; Sailor, Wayne & Baer, Donald M. (Kansas Neurological Inst, Topeka) **To teach language to retarded children.** In R. L. Schiefelbusch & L. L. Lloyd (Eds), *Language perspectives: Acquisition, retardation, and intervention*. Baltimore, MD: University Park Press, 1974. xv, 670 p \$14.50.—Reviews studies (a) dealing primarily with normal speech and language development and (b) using operant procedures or behavior modification with language-deficient children. An experimental training

program is described, and 7 experiments within the program are outlined, as the guiding framework for a training manual. (4 p ref)

6207. Hyatt, Ralph & Rolnick, Norma (Eds.). (St Joseph's Coll) **Teaching the mentally handicapped child.** New York, NY: Behavioral Publications, 1974. vii, 337 p.

6208. Johnson, Carl M. & Kaye, James H. (Kalamazoo Valley Multihandicap Ctr, MI) **The development of lip reading through generalized conditioned reinforcement in a deaf multiply handicapped child.** *SALT: School Applications of Learning Theory*, 1974(Jul), Vol 6(4), 21-30.—Reports the successful use of conditioned reinforcement in teaching lip reading to a 9-yr-old boy, diagnosed as emotionally disturbed and trainable mentally retarded, with an IQ of 45 and a moderate-to-severe hearing loss when wearing an aid. After a baseline score was obtained, reinforcement, consisting at first of tokens and praise and secondly of smiles, was used after correct choices of fruits voiced by the teacher. Later, the fruits were only mouthed, and reinforcement was given in various fixed ratio schedules. Durability checks produced correct responses of 92% and 97%. It is concluded that clinicians can use tangible immediate reinforcers such as tokens to shape and maintain complex behaviors.—D. R. Marina.

6209. Jones, Reginald L. (U California, Berkeley) **Student views of special placement and their own special classes: A clarification.** *Exceptional Children*, 1974(Sep), Vol 41(1), 22-29.—Administered a school morale inventory by L. Wrightman et al to 341 junior high school mental retardates and 717 nonretarded students, to study the school attitudes of the students and to contrast the attitudinal findings with earlier data on stigma reported by teachers and by mental retardates. Results reveal as many positive responses were given by special class students to various questions as were given by the nonretarded group. Since other investigations indicate overwhelmingly that retarded students reject special class placement, it is suggested that retarded students reject the stigma of special placement but hold many positive attitudes toward their classroom and school experiences. An analysis of responses from 114 suburban mental retardates and 227 inner-city retardates reveals more positive attitudes held by the suburban retarded. It is suggested that retarded students cannot be considered a homogeneous group and that the educational problems of the inner-city retardates are particularly acute.—*Journal abstract*.

6210. Kaslow, Florence W. (Hahnemann Graduate School, Philadelphia, PA) **Movement, music and art therapy techniques adapted for special education.** In R. Hyatt & N. Rolnick (Eds), *Teaching the mentally handicapped child*. New York, NY: Behavioral Publications, 1974. vii, 337 p.

6211. Kozloff, Martin A. (Boston U, Ctr for Applied Social Science) **Educating children with learning and behavior problems.** New York, NY: John Wiley & Sons, 1974. xix, 459 p. \$16.95.—Presents a handbook for teachers, parents, therapists, and administrators designed to develop a comprehensive education program for children with a variety of learning and behavior problems. Principles, evaluation of the child, planning of

programs, and teaching in such areas as learning readiness, motor skills, imitation, speech, and self-help skills are detailed. Assignments at the end of each chapter are included to give the reader practice in planning and conducting similar programs.

6212. **Kunce, Joseph T.; Bruch, Monroe A. & Thelen, Mark H.** (U Missouri, Regional Rehabilitation Research Inst) **Vicarious induction of academic achievement behavior in disadvantaged adults.** *Journal of Counseling Psychology*, 1974(Nov), Vol 21(6), 507-510.—Used a counseling procedure termed "vicarious induction of behavior" to develop academic achievement motivation in disadvantaged adults. The procedure required an analysis of the desired target behavior—academic achievement motivation—to identify specific skills and covert attitudes. Ss viewed and discussed videotapes that had models depicting a desire to achieve academic success and methods of achieving and executing specific achievement skills. New behaviors emerging as a consequence of the O's attainment of the modeled achievement behaviors were anticipated, specified, and evaluated. Results of a preliminary experimental study of 26 adults in basic education classes show that the procedure is easily applied and effective.—*Journal abstract*.

6213. **Lane, Elaine.** (Bridgeport Public School System, CT) **Severe reading disability and the initial teaching alphabet.** *Journal of Learning Disabilities*, 1974(Oct), Vol 7(8), 479-483.—Conducted a pilot study to determine whether the initial teaching alphabet (ITA) can serve as a remediation tool that would significantly improve the reading achievement level of 6th graders with a severe reading disability. Using the Gray Oral Reading Test in a public elementary school, 11 male and 3 female 11-13 yr old Puerto Rican and black 6th graders were identified as reading at or below the 2nd grade reading level. A prescribed training program with the ITA was followed for 100 school days. The Gray test was again administered, and reading levels were found to be significantly improved.—*Journal abstract*.

6214. **Luckey, Robert E. & Addison, Max R.** (National Assn for Retarded Citizens, National Child Advocacy Project, Arlington, TX) **The profoundly retarded: A new challenge for public education.** *Education & Training of the Mentally Retarded*, 1974(Oct), Vol 9(3), 123-130.—Describes the training methodology used over the last decade in residential and other nonschool settings with profoundly retarded persons. Problems unique to the profoundly retarded and suggested areas for program emphasis are presented to provide a frame of reference for future curriculum development. (3 p ref)—*Journal abstract*.

6215. **Lutzker, John R. & Sherman, James A.** (U of the Pacific) **Producing generative sentence usage by imitation and reinforcement procedures.** *Journal of Applied Behavior Analysis*, 1974(Fal), Vol 7(3), 447-460.—3 retarded Ss aged 32, 12, and 6 yrs and 2 developmentally normal toddlers aged 2.5 yrs were trained, using imitation and reinforcement procedures, to use correct sentences. The experimental task was to use sentences with correct subject-verb agreement to describe pictures that were presented to the Ss. 2 classes of sentences were taught: those involving a plural subject that required the

use of the verb "are" (e.g., "the boys are running") and those involving a singular subject that required the use of the verb "is" (e.g., "the boy is running"). The basic design of the study involved multiple baselines for each class of sentences. 4 of the Ss began to produce novel, untrained sentences of a particular type to generalization probe pictures when that particular class of sentence was currently being trained. Thus, the imitation and reinforcement procedures appeared to be functional in producing generative sentence usage for both types of sentences. One S produced correct sentences to both singular and plural probe pictures when only "is" sentences had been taught. A reversal procedure and retraining phase indicated that for this S, imitation and reinforcement procedures for training one class of sentence behavior seemed functional in producing generative responses of the other class of sentences. (15 ref)—*Journal abstract*.

6216. **Miller, Jon F. & Yoder, David E.** (U Wisconsin, Madison) **An ontogenetic language teaching strategy for retarded children.** In R. L. Schiefelbusch & L. L. Lloyd (Eds), *Language perspectives: Acquisition, retardation, and intervention*. Baltimore, MD: University Park Press, 1974. xv, 670 p \$14.50.—Describes a program specifying the relationship between form, function, and experience and providing for the shaping of attending behavior and increasing motivation in retarded children. It also provides for testing the relative contribution of programed experience and linguistic marking in the cognitive-perceptual aspects of language development. (38 ref)

6217. **Murphy, John F.** (Hingham Public Schools, MA) **Learning by listening: A public school approach to learning disabilities.** *Academic Therapy*, 1972-1973(Win), Vol 8(2), 167-189.—Describes a format for meeting individual needs of students with learning disabilities in regular elementary and secondary programs. The program includes auditory learning, individual presentation, sympathetic classrooms, oral examinations, different homework, and qualified report cards. Examples of modified scheduling are given, with instructional techniques for the regular classroom teacher.—*M. E. Blankenship*.

6219. **Rosen, Marvin.** (Elwyn Inst, PA) **Behavior modification.** In R. Hyatt & N. Rolnick (Eds), *Teaching the mentally handicapped child*. New York, NY: Behavioral Publications, 1974. vii, 337 p.—Discusses the theory and application of behavior modification principles in teaching mentally handicapped children. Token economies, principles of operant conditioning and instrumental learning, and the use of shaping and reinforcement techniques in classroom settings are described, and case examples of their use with 3 mentally retarded persons are presented. (17 ref)

6220. **Rosen, Marvin.** (Elwyn Inst, PA) **The acquisition of language.** In R. Hyatt & N. Rolnick (Eds), *Teaching the mentally handicapped child*. New York, NY: Behavioral Publications, 1974. vii, 337 p.

6221. Stevens-Long, Judith & Rasmussen, Marilyn. (California State U. Los Angeles) **The acquisition of simple and compound sentence structure in an autistic child.** *Journal of Applied Behavior Analysis*, 1974(Fal), Vol 7(3), 473-479.—Used contingent reinforcement and imitative prompts to teach an autistic 8-yr-old male to use simple and compound sentences to describe a set of standard pictures. When imitative prompts and reinforcement were discontinued, correct use of simple sentences declined, but increased again when imitative prompts and reinforcement were reinstated. When imitative prompts and reinforcements were used to teach compound sentence structure, correct use of simple sentences declined, and correct use of compound structure increased. At the end of training, the child also used novel compound sentences to describe a set of pictures on which he had received no direct training. —*Journal abstract.*

6222. Sykes, K. C. (Florida State U) **Camp Challenge: Program for parents and their preschool children with visual handicaps.** *New Outlook for the Blind*, 1974(Oct), Vol 68(8), 344-347.—Describes a 6-day "camp challenge program" for preschool children with visual handicaps and their parents which provides parents with information about their children's needs and teaches the children personal care, and social, language, and motor skills along with traditional camp activities. Recruitment, programing, financial, and administrative issues related to the operation and sponsorship of the program are discussed.

6223. Tuttle, Dean W. (U Northern Colorado) **A comparison of three reading media for the blind: Braille, normal recording, and compressed speech.** *Education of the Visually Handicapped*, 1972(May), Vol 4(2), 40-44.—Compared the available reading media for visually handicapped individuals in terms of efficiency and other important factors related to the blind individual's capacity to approximate normal reading conditions. Test material was prepared in each reading medium and distributed to the sample population. An index of learning efficiency was computed for each test. Results reveal that while comprehension was the same for the 3 media, there were significant variations in time and efficiency, and that compressed speech was most advantageous.—C. L. Nicholson.

6224. Wagner, Patricia. (Bronx Developmental Services, Model Rehabilitation Program, NY) **Children tutoring children.** *Mental Retardation*, 1974(Oct), Vol 12(5), 52-55.—In 2 parts, reviews literature on children tutoring other children. Part 1 presents tutorial models for non-mentally-retarded children; Part 2 discusses literature on the retarded tutoring other retarded children. (32 ref)

6225. Williams, Charlotte L. & Blake, Kathryn A. (U Georgia, Special Reading Instructional Procedures for Mentally Retarded & Learning Disabled Children Research Program) **Special reading instructional procedures for mentally retarded and learning disabled children: Overview of research program activities.** *Education & Training of the Mentally Retarded*, 1974(Oct), Vol 9(3), 143-149.—Briefly summarizes the problem, goals, target groups, organizing dimensions, specific program activities, and strategies used in

conducting research during the 1st 2 yrs of an experimental reading instructional program for retarded and learning-disabled children.

6226. Wilson, Diana A. **Teaching multiply handicapped blind persons in a state hospital.** *New Outlook for the Blind*, 1974(Oct), Vol 68(8), 337-343, 362.—Discusses the need of multiply handicapped blind residents of state institutions for alternative programs of education. The multiplicity of handicaps makes it necessary to tailor a program for almost every individual. A compensatory education program for 14 blind retarded youths in a state institution is described; the program included auditory evaluation and training, body image training, tactual learning, leisure-time activities and skills, and sensory motor training. Suggestions for staff training are presented, the use of behavior modification techniques in similar program is discussed, and the need to combat dehumanization for institutionalized persons by making educational and recreational programs available is noted.—*Journal abstract.*

6227. Winkelstein, Ellen; Shapiro, Bernard J.; Tucker, Dorothy G. & Shapiro, Phyllis P. (Rhode Island Coll) **Early childhood educational objectives for normal and retarded children.** *Mental Retardation*, 1974(Oct), Vol 12(5), 41-45.—Presents a model for early childhood education where the objectives are viewed as the same for normal and retarded children with variations only in the degree of achievement. The means by which the classroom teacher can construct educational objectives that cover various behaviors is discussed.

6228. Withrow, Frank B. (US Dept of Health, Education, & Welfare, National Advisory Committee on the Handicapped, Washington, DC) **The fine art of auditory training, or is anyone listening?** *Volta Review*, 1974(Oct), Vol 76(7), 415-419.—Reviews features of hearing and of training for children whose hearing is impaired. The sense of hearing plays major roles in safety and in communication. Auditory training should be matched to the needs and requirements of each hearing-impaired child. 15 objectives, grouped under 3 major heads, are listed. Speaking directly into the young child's ear, and the use of electronic amplification of sound, should begin as early as possible. Early auditory experience builds a basis for communication via self-stimulation, and leads to the association of sight and sound as a foundation for language. Conclusions of some authorities on the subject are cited.—W. A. Hass.

6229. Wooster, Arthur D. (U Nottingham, School of Education, England) **Acceptance of responsibility for school work by educationally subnormal boys.** *British Journal of Mental Subnormality*, 1974(Jun), Vol 20(38, Pt 1), 23-27.—Tested the hypothesis that mentally retarded children educated in an informal school offering opportunities to choose and to experience the outcome of choice, in a supportive atmosphere, would be able to accept more responsibility for their own successes and failures in school. Increased awareness of the relationship between personal striving and outcome was expected to result in higher attainment scores on a measure of reading ability. 2 groups of 20 boys, matched for age and home background, were chosen to represent the extremes on a formal-informal dimension. Ss were tested by a group reading assessment and on the Intellectual

Achievement Questionnaire. Greater acceptance of responsibility for academic achievement was found in informal school Ss, who also scored significantly higher on the reading test. Comparison on measures of locus of control and reading ability supported both hypotheses.—R. Hall.

### Counseling & Measurement

6230. Befring, Edvard. (U Aarhus, Denmark) [Educational-psychological research.] (Danish) *Skolepsykologi*, 1974, Vol 11(5), 379-383.—Discusses educational research, stressing the need for decentralization. Neglected problem areas calling for research, and the new perspectives required, are considered.

6231. Coons, Frederick W. (Indiana U, Medical School) Sex on campus: Informing and advising a new student. *Medical Aspects of Human Sexuality*, 1974(Sep), Vol 8(9), 25-26.—Presents suggestions for counselors and physicians in assessing a student's personal relationships and helping him understand his sexuality. A history that includes information about the student's peer and parent interactions and self-concept is crucial in evaluating developmental and psychological progress.

6232. Cull, John G. & Hardy, Richard E. (Eds.). (Virginia Commonwealth U) *Counseling high school students: Special problems and approaches*. Springfield, IL: Charles C Thomas, 1974. xiii, 256 p.

6233. Engin, Ann W. (Ohio State U, Coll of Education) An analysis of supplementary subtests and their influence on the total WISC scores of high achieving students. *Journal of Psychology*, 1974(Sep), Vol 88(1), 121-125.—Attempted to determine whether or not the addition of one or both of the supplementary WISC subtests, Digit Span of the Verbal Scale and Mazes of the Performance Scale, materially affected the obtained IQs for 44 high-achieving 5th-grade Ss. All 12 subtests of the WISC were individually administered to Ss, and IQs were then calculated in such a manner that specific comparisons could be made. These comparisons were between WISC Verbal, Performance, and Full Scale IQs composed of the maximum number of subtests, and Verbal, Performance, and Full Scale IQs exclusive of Digit Span, Mazes, or both subtests. Analyses by use of *t* tests for correlated means revealed highly significant differences. The addition of Digit Span and Mazes in the WISC battery served to depress the Verbal, Performance, and Full Scale IQs of the high-achieving Ss.—*Journal abstract*.

6234. Fielding, Michael F. & Pappas, James P. (McGuire VA Hosp, Psychological Services, Richmond, VA) Internal-external control of reinforcement and the Strong Vocational Interest Blank: A comparison study. *Journal of Counseling Psychology*, 1974(Nov), Vol 21(6), 482-484.—Studied the relationship between the Strong Vocational Interest Blank (SVIB), Form T399, and Rotter's Internal-External Control Scale (I-E scale). A previous study by D. G. Zytowski (see PA, Vol 41:7353) suggested a relationship between locus of control and occupational interest. To verify this, he correlated the SVIB with the I-E scale and concluded that such a relation did exist. Because the SVIB has been revised since Zytowski's study, a comparable study using the newer SVIB form was completed. Using a college

freshman sample of 736, Pearson correlation coefficients were computed between the I-E scale and the SVIB; several correlations were significant at the .10 level; however, the largest correlation was -.16.—*Journal abstract*.

6235. Flaughter, Ronald L. (Educational Testing Service, Princeton, NJ) Some points of confusion in discussing the testing of black students. In L. P. Miller (Ed), *The Testing of black students: A symposium*. Englewood Cliffs, NJ: Prentice-Hall, 1974. x, 113 p.—Discusses 4 major confusions that have delayed the progress toward the realization that testing is not always a source of unfairness for minority students—misconceptions about the nature of the psychometric model, exaggerations about the objectivity of psychometrics, misinterpretations about the meaning of psychometric terms, especially "validity," and most important, the question of the functions that tests serve.

6236. Graff, Robert W.; Raque, David & Danish, Steven. (Salisbury State Coll) Vocational-educational counseling practices: A survey of university counseling centers. *Journal of Counseling Psychology*, 1974(Nov), Vol 21(6), 579-580.—Assessed vocational-educational counseling at 52 university counseling centers. Surveyed were staff resources (level of staff) directed to vocational counseling, the use of innovative procedures in vocational counseling, and the degree to which career counseling services were evaluated. Results show that master's level staff and practicum students did most of the vocational counseling, innovative practices were few, and research and evaluation were limited.—*Journal abstract*.

6237. Grandy, Thomas G. & Stahmann, Robert F. (U Iowa, Counseling Service) Family influence on college students' vocational choice: Predicting Holland's personality types. *Journal of College Student Personnel*, 1974(Sep), Vol 15(5), 404-409.—Conducted interviews with 487 college freshmen who were decided on their occupational choices about parental educational backgrounds, political orientations, religious preferences, and other background variables. Ss were then classified according to J. Holland's personality and occupational typology. A stepwise discriminant analysis was performed to evaluate the relative importance of the family variables in the typology, and 4 categories of similarity or consistency between personality and occupational choices were formed (exact, adjacent, intermediate, and opposite). Personality types were exactly predicted in 45.3% of the cases; for 26.7%, predictions corresponded to personality types adjacent to expressed occupational choices. Family variables were most successful in predicting personality types (exact and adjacent choices) for the social and enterprising groups, and least successful in predicting investigative types. 5 of the 8 best predictors were related to parents' occupations.—L. Gorsey.

6238. Gross, Leon J. & Gaier, Eugene L. (State U New York, Buffalo) College major and career choice: A retest of Holland's theory. *Journal of Vocational Behavior*, 1974(Oct), Vol 5(2), 209-213.—Studied whether the previously established relationship between vocational choice and self-ratings on J. L. Holland's personality stereotypes among college freshmen would be strengthened with 109 male college seniors sampled on the basis

of major field choice. Ss completed a questionnaire to select career stereotypes which described them best. Significant relationships were obtained for 4 stereotypes (realistic, conventional, enterprising, and artistic) on the basis of both major and vocational choice, although significant stereotypes were not identical in each. 3 of these significant relationships based on vocational choice matched those obtained previously. An additional finding suggested that vocational choice was slightly more valid than major field as a basis for utilizing this technique. However, the more restricted class sample emphasized did not produce a more substantial relationship between self-ratings and occupational choice as expected.—*Journal abstract.*

6239. Hambleton, Ronald K. & Traub, Ross E. (U Massachusetts) **The effects of item order on test performance and stress.** *Journal of Experimental Education*, 1974(Fal), Vol 43(1), 40-46.—Studied the effect of item order (easy-to-difficult or difficult-to-easy) on 106 11th graders' performance on a mathematics test (Cooperative Mathematics Test Algebra II), on the amount of stress experienced by Ss during the test (assessed by heart-rate measures), and on the performances of high and low test-anxious Ss (assessed by the Alpert-Haber Achievement Anxiety Test). Results show that the mean number of correct answers for questions arranged in the difficult-to-easy order was significantly lower than the number arranged in the reverse order and that the difficult-to-easy order increased heart rate more than the reverse order. No differences in performance were found between high and low test-anxious Ss. (28 ref)—*L. Gorsey.*

6240. Henrysson, Sten & Wedman, Ingemar. (U Umea, Sweden) **Some problems in construction and evaluation of criterion-referenced tests.** *Scandinavian Journal of Educational Research*, 1974, Vol 18(1), 1-12.—Discusses problems in establishing the goals of criterion-referenced tests, specifying short- and long-term learning objectives, insuring the homogeneity of test items, and determining appropriate score cut-off levels. The rationale behind different item analysis procedures for criterion-referenced data is examined, recent empirical data on the evaluation of these tests is presented to demonstrate the intercorrelations between these various analysis procedures, and the future of criterion-referenced testing is considered. (30 ref)—*L. Gorsey.*

6241. Hufstader, Ronald A. (U Iowa) **Predicting success in beginning instrumental music through use of selected tests.** *Journal of Research in Music Education*, 1974(Spring), Vol 22(1), 52-57.—34 beginning instrumental students in Grades 4-6 in 4 bands in an urban North Carolina school system were divided into high and low groups as judged by technique, tone quality, musical reading ability, rhythmic reading ability, and general musicality. Test battery data indicate that 14 of the 18 Ss rated high could be identified by their test score profiles, while 15 of the 16 Ss rated low were classified correctly. Variables ranked in order of importance were intelligence (California Test of Mental Maturity), musicality (Gaston's Test of Musicality), academic achievement (California Achievement Tests), and tests with various types of apparatus.—*D. S. Higbee.*

6242. Hurst, James C.; Davidshofer, Charles O. & Arp, Suzanne. (Colorado State U, Counseling Ctr) **Current perceptions and practices of charging fees in college and university counseling centers.** *Journal of Counseling Psychology*, 1974(Nov), Vol 21(6), 532-535.—Mailed a questionnaire that assessed the practice of charging special fees for counseling, testing, and outreach programs, as well as the perceptions of counseling center directors on the fee issue, to 281 directors of college and university counseling centers. Results indicate that 36% of the agencies receive partial funding from student fees; only 3% receive compensation from student or faculty insurance programs. Charging fees for counseling services to students is a practice of only 4% of the respondents, a proportion which has remained stable over the past 10 yrs. In contrast, the proportion of agencies that charge fees for testing has increased from 11 to 34% over the 10-yr period.—*Journal abstract.*

6243. Kramer, Howard C.; Berger, Florence & Miller, George. (Cornell U, Office of the Dean of Students) **Student concerns and sources of assistance.** *Journal of College Student Personnel*, 1974(Sep), Vol 15(5), 389-393.—Administered a questionnaire on the types of student problems, perceptions of available sources for help, and the types of problems not addressed by the university of 1,200 undergraduates. Data from the responses of 293 male and 140 female undergraduates and graduate students show that the most important problems for both males and females were vocational choices and career planning and personal unhappiness. A significantly higher proportion of women than men reported having problems. "Friend" was the most frequently mentioned source of help for personal problems and the career center and faculty advisor were most frequently mentioned for academic and career problems. Class and specific sex differences are reported, along with the types of problems for which Ss perceived that there was no help available and implications for counseling and program intervention.—*L. Gorsey.*

6244. Kruuse, Emil. (School Psychology Office, Albertslund, Denmark) **[Research and investigation by school psychologists.]** (Danish) *Skolepsykologi*, 1974, Vol 11(5), 350-363.—Describes and comments on 99 responses to a questionnaire distributed in September 1973 to the 113 school psychological offices in Denmark concerning current and planned projects. 34 of the current projects were of the traditional type e.g., testing and special education, 13 dealt with educational psychology and 8 were investigations of the curriculum and the structure of the school system. The low level of local activities is explained by work, lack of personnel, and no active support from relevant authorities.—*P. Mylov.*

6245. Lambert, Nadine M. (U California, School of Education, Berkeley) **A school-based consultation model.** *Professional Psychology*, 1974(Aug), Vol 5(3), 267-276.—Differentiates between school- and community-based consultation. Objectives of school-based consultation may be changes in pupil behavior, teacher behavior, or a combination of both. Consultation is described as essentially directive, informational, and problem-oriented, encompassing 3 stages: gaining teacher acceptance and trust, sharing ideas about classroom problems, and working together for optimal education. It is stated that

both consultants and school administrators will benefit from systematic evaluation of consultation. (15 ref)—C. Wright.

6246. Lennon, Roger T. **The testing of black students: Dilemmas for test publishers.** In L. P. Miller (Ed), *The Testing of black students: A symposium*. Englewood Cliffs, NJ: Prentice-Hall, 1974. x, 113 p.

6247. Mercer, Jane R. **Latent functions of intelligence testing in the public schools.** In L. P. Miller (Ed), *The Testing of black students: A symposium*. Englewood Cliffs, NJ: Prentice-Hall, 1974. x, 113 p.

6248. Mertz, William H. & Doherty, Michael E. (Bowling Green State U) **The influence of task characteristics on strategies of cue combination.** *Organizational Behavior & Human Performance*, 1974(Oct), Vol 12(2), 196-216.—Studied the validity of the conclusion that cue combination in clinical judgment can be described by a simple, additive model. Cue characteristics were manipulated to see whether Ss might appear linear under some conditions but not others. Each of 9 experienced high school guidance counselors made 1,368 predictions of college success based upon either 1 or 2 aptitude test scores. The 2-cue data were examined using several models. Although the linear model accounted for a high proportion of the predictable variance for all Ss in all conditions, within 1 condition (high subjective correlation between cues), 7 of the Ss were markedly nonlinear. It is concluded that one cannot talk about linear or configural judges independently of task conditions. (22 ref)—*Journal abstract*.

6249. Miller, Lamar P. (Ed.). (New York U) **The testing of black students: A symposium.** Englewood Cliffs, NJ: Prentice-Hall, 1974. x, 113 p.

6250. Mitchell, Kenneth R. & Piatkowska, Olga E. (U New South Wales, Student Counseling & Research Unit, Kensington, Australia) **Effects of group treatment for college underachievers and bright failing underachievers.** *Journal of Counseling Psychology*, 1974(Nov), Vol 21(6), 494-501.—Presents a review of findings of 31 treatment studies of college underachievers and bright failing underachievers separately, with the purposes of (a) evaluating the effects of group treatments on the academic performance of these students and (b) isolating from the data variables related to improved academic performance. Variables from the following categories are examined: counselor experience, treatment type, treatment duration and structure, treatment targets, and client motivation. Findings indicate that success rates are low and that there are few clear relationships between isolated variables and improvement in academic performance. (34 ref)—*Journal abstract*.

6251. Nissen, Thomas. [Indispensable research areas.] (Danh) *Skolepsykologi*, 1974, Vol 11(5), 384-386.—Discusses research in educational psychology with emphasis on 3 areas that should have equal priority: (a) observation of behavior patterns leading to intervention, (b) instructional content providing a true description of the world, and (c) education of parents to elucidate inhibiting factors in the family.

6252. Oliver, Laurel W. (U Maryland) **The effect of verbal reinforcement on career choice realism.** *Journal of Vocational Behavior*, 1974(Oct), Vol 5(2), 275-284.—24 male undergraduates viewed 102 slides containing

occupational titles and stated whether each represented a realistic career choice. Each S was given 3 trials, with experimental Ss receiving positive verbal reinforcement on the 2nd trial for realistic responses. (If the choice was congruous with the individual's occupational type, as determined by the Vocational Preference Inventory, it was scored as realistic). Results reveal a tendency for all Ss to increase in career choice realism as a function of participation in the experiment, with significantly ( $p < .05$ ) more experimental Ss than control Ss demonstrating an operant system of responses. (18 ref)—*Journal abstract*.

6253. Plotkin, Lawrence. (City U New York) **Research, education, and public policy: Heredity v. environment in Negro intelligence.** In L. P. Miller (Ed), *The Testing of black students: A symposium*. Englewood Cliffs, NJ: Prentice-Hall, 1974. x, 113 p.

6254. Ravenette, A. T. **Maladjustment: Clinical concept or administrative convenience: Psychologists, teachers and children: How many ways to understand?** *Association of Educational Psychologists' Journal & Newsletter*, 1972(Fal), Vol 3(2), 41-47.—Advocates a model with universal application for understanding the disturbed and disturbing child. Everyone develops his own personal map of people and interpersonal relationships for making sense of his world. Using this model, the educational psychologist can help teacher and child understand their relationship.

6255. Rustin, Stanley L. (Queensborough Community Coll, Bayside, NY) **The gringo and counseling Puerto Rican college students.** *Handbook of International Sociometry*, 1973, Vol 7, 37-42.—Describes a year of group counseling by a non-Puerto Rican of Puerto Rican college students enrolled in an urban college. Conflicts between traditional Puerto Rican values and middle-class American values, personal identity confusion, and sexual role conflicts are common dilemmas of the Puerto Rican college student. Group counseling techniques were used with a group of 7 females and 5 males. Feelings of deprivation, powerlessness, and being victimized by a racist society were expressed by the group. Involvement of a non-Puerto Rican counselor with Puerto Rican students was initially successful because the students had a basis for a trusting relationship outside of the counseling context; but as new students arrived at the school the gringo was rejected because he was not a Puerto Rican. This result suggests the need for the Puerto Rican student to establish himself without non-Puerto Rican help.—R. J. Ambrosino.

6256. Scott, Craig S.; Fenske, Robert H. & Maxey, E. James. (Oregon State System of Higher Education, Teaching Research Div, Monmouth) **Change in vocational choice as a function of initial career choice, interests, abilities, and sex.** *Journal of Vocational Behavior*, 1974(Oct), Vol 5(2), 285-292.—Studied changes in expressed vocational choices made over an 18-mo period by 2,928 students enrolled in 1 of 62 2-yr institutions. 4 mutually exclusive categories of vocational choice change were constructed based on the American College Testing Program Career Planning Profile and its follow-up questionnaire. Ability, interest, and family background measures were used as independent variables. Results indicate that (a) changers were very similar

to nonchangers in terms of the independent variables examined, (b) there were substantial differences in the choice changes made by males and females, and (c) vocational choice change patterns varied widely among groups of individuals whose original vocational choices placed them in different major vocational categories. —*Journal abstract.*

6257. Small, M. M.; DeYoung, Alan J. & Moos, Rudolf H. (Stanford U) **The University Residence Environment Scale: A method for describing university student living groups.** *Journal of College Student Personnel*, 1974(Sep), Vol 15(5), 357-365.—Describes the development, use, and validation of a new scale, the University Residence Environment Scale, which systematically assesses the social climates of university student living groups. A comparison between living units and group climates on 2 large university campuses is presented. (24 ref)

6258. Soegard, Arne. (Office of School Psychology, Lyngby-Taarbæk, Denmark) **[Problems concerning construction of new tests and translation of foreign tests.]** (Danish) *Skolepsykologi*, 1974, Vol 11(5), 387-402.—Describes construction, revision, and proper use of tests in the practice of educational psychology. Many new tests of specific functions and abilities are needed but general standards should be avoided. A qualitative, clinical analysis is a prerequisite and norms must be local averages.

6259. Temp, George E. **Psychometric barriers to higher education.** In L. P. Miller (Ed), *The Testing of black students: A symposium*. Engelwood Cliffs, NJ: Prentice-Hall, 1974. x, 113 p.

6260. Tucker, Robert N. & Gunnings, Thomas S. (New York U) **Counseling black youth: A quest for legitimacy.** *Journal of Non-White Concerns in Personnel & Guidance*, 1974(Jul), Vol 2(4), 208-216.—Questions the validity of many of the counseling techniques used with black counselees. 3 principal topics are presented: (a) an explanation of how the liberal and progressive traditions of counselors are different from the emerging values of growing numbers of black counselors; (b) an illustration of how the practices which are the consequences of these values are dysfunctional in terms of both their immediate and long-range effects on all black Americans; and (c) an identification of some trends already in progress which give a different philosophical basis that may lead to viable alternate counseling procedures vis-à-vis black youth, in particular. (27 ref)—*M. E. Pounsel.*

6261. Wakefield, James A.; Alston, Herbert L.; Yom, B. Lee & Doughtie, Eugene B. (U Houston) **Related factors of the survey of study habits and attitudes and the Vocational Preference Inventory.** *Journal of Vocational Behavior*, 1974(Oct), Vol 5(2), 215-219.—Administered the Survey of Study Habits and Attitudes (SSHA) and the Vocational Preference Inventory (VPI) to 100 undergraduates. The scales of the 2 instruments were compared using canonical analysis. The analysis revealed a relationship between a component of the SSHA and a component of the VPI which accounted for 31% of the variance of the 2 instruments. The related components indicate that a dimension running from an academic orientation to a nonacademic orientation was

measured by certain scales of each instrument.—*Journal abstract.*

6262. Ward, J. (U Victoria, British Columbia, Canada) **The measuremetre: A useful psychometric concept.** *Association of Educational Psychologists' Journal & Newsletter*, 1972(Fal), Vol 3(2), 52-53.—Presents an empirically derived formula which permits calculation of the number of grades (the measurements) to be allowed in order to communicate test results, incorporating the idea of measurement errors.

6263. Westbrook, Franklin D. (U Maryland, Counseling Ctr) **A comparison of three methods of group vocational counseling.** *Journal of Counseling Psychology*, 1974(Nov), Vol 21(6), 502-506.—Superimposed a group discussion process over a typical vocational counseling process in which the primary focus was on test information, and over 2 atypical vocational counseling processes, one in which occupational information was primary and the other in which test information and occupational information were optional and randomly presented upon a group member's request. All Ss selected goals in the initial stages of counseling. 57 undergraduates were studied in 6 single-sex experimental groups and 2 control groups. Data from a levels-of-decision-making scale, the Edwards Personal Preference Schedule, and the Kuder Occupational Preference Inventory show that the atypical groups learned significantly more and retained longer than did both the typical and control groups. (15 ref)—*Journal abstract.*

6265. Williams, Robert L. (Washington U) **The problem of match and mismatch in testing black children.** In L. P. Miller (Ed), *The Testing of black students: A symposium*. Engelwood Cliffs, NJ: Prentice-Hall, 1974. x, 113 p.

6266. Yanai, Haruo. **[An investigation of the procedure of aptitude diagnosis: II. Aptitude diagnosis for 84 specialized courses of the university.]** (Japn) *Japanese Journal of Educational Psychology*, 1973(Sep), Vol 21(3), 148-159.—Used factor analysis to derive 60 predictor and 36 criterion scales from measures of interest, personality, vocational interest, and abilities obtained from 631 4th yr college and graduate students in 144 academic specializations. Of 576 Ss (excluding 55 whose interests did not match the specialized areas), 84 specializations were identified. Distances in terms of Euclidian measures among the 84 areas were calculated and analyzed, yielding 12 clusters. Multiple discriminant analysis based on 60 predictor and 36 criterion measures of the 12 cluster areas yielded 4 factors: Natural science vs Humanities, Architecture vs Chemistry and Medicine, Practical vs Research, and Social vs Individual. (English summary)—*S. Choe.*

6267. Yarber, William L. (Purdue U) **Retention of knowledge: Grade contract method compared to the traditional grading method.** *Journal of Experimental Education*, 1974(Fal), Vol 43(1), 92-96.—Studied whether students graded by the contract method (experimental group) would retain, for a 5-wk period, the knowledge

level possessed at the end of a 9-session venereal disease unit and if the contract students would retain as much, or more, knowledge than students graded by the traditional method (control group). 27 Ss for the grade contract group were drawn from 2 junior high school health classes and the 30 Ss for the traditional grading group were drawn from 2 other health classes. Results indicate that the grade contract students, as well as the traditional grading students, retained the knowledge level possessed at the end of the unit, and that the contract students did not retain any more, or less, knowledge than the traditional grading students. (20 ref) —*Journal abstract.*

## APPLIED PSYCHOLOGY

6268. Ashton, Robert H. (U Texas, Austin) **Cue utilization and expert judgments: A comparison of independent auditors with other judges.** *Journal of Applied Psychology*, 1974(Aug), Vol 59(4), 437-444.—Examined cue utilization by independent auditors, a type of expert judge, within an analysis of variance framework. After reading a brief narrative describing a hypothetical manufacturing company, 63 auditors judged the strength of payroll internal control as a function of 32 different combinations of 6 internal control indicators. Results demonstrate the overwhelming importance of main effects as compared to configural cue utilization. The average correlation for interjudge consistency was .70, while the average intrajudge correlation was .81. The average insight index (the correlation between an auditor's subjective weights and the statistical weights of the 6 cues) was .89. Similarities and differences between the present findings and those of studies involving other types of expert judges are discussed. (17 ref)—*Journal abstract.*

6269. Battalio, Raymond C. et al. (Texas A&M U) **An experimental investigation of consumer behavior in a controlled environment.** *Journal of Consumer Research*, 1974(Sep), Vol 1(2), 52-60.—Describes the general structure of controlled economic environments and reports the results of a series of experimentally induced price changes on consumer behavior in one such environment—a token economy system established in a female ward for chronic psychotics at a state hospital. Findings demonstrate that consumption patterns did not immediately return to their original values following displacement and that there were definite patterns to this behavior. Results also demonstrate the suitability of controlled economic environments as laboratories for the experimental analysis of consumer behavior and add to the understanding of consumer behavior, particularly with respect to the continuing effects of temporary price changes on the composition of consumption. (23 ref) —*Journal abstract.*

6270. Bauman, Karl E. & Chase, Charles L. (U North Carolina, Chapel Hill) **Interviewers as coders of occupation.** *Public Opinion Quarterly*, 1974(Spr), Vol 38(1), 107-112.—Examined an alternative approach to the measurement and coding of occupational status by changing the procedure of obtaining initial information. The new procedure was used in a survey of attitudes and

practices toward family planning conducted with a sample of 846 white and 851 black women in 9 cities during 1969. Its efficiency was determined by the strength of correlation of the occupational status and education of the male head of the household with family income. Results show that codings by interviewers were significantly correlated with those of office coders, but that the correlation was more significant for white than for black interviewers. It is concluded that in general, interviewer coding is as efficient as office coding.—M. K. Phifer.

6271. Berning, Carol A. & Jacoby, Jacob. **Patterns of information acquisition in new product purchases.** *Journal of Consumer Research*, 1974(Sep), Vol 1(2), 18-22.—Used a process methodology to examine information acquisition behavior for new vs established purchase alternatives and for innovators vs noninnovators. 5 types of information were studied—actual ads from print media, price, actual package information, comments attributed to "friends," and comments attributed to sales personnel—in the context of purchase decisions made by 86 20-82 yr old women for 5 new products. Results indicate that significant differences exist between the amount of information requested from the "friend" source by innovators about new products. Personal information sources were consulted after impersonal sources. The significant Innovativeness  $\times$  Information Source interaction suggests that the decision-making process preceding the purchase of an innovative product differs from the process preceding the purchase of an established product, and that this difference lies primarily in the search for information from friends. (28 ref)—L. Gorsey.

6272. Bettman, James R. (U California, Graduate School of Management, Los Angeles) **A threshold model of attribute satisfaction decisions.** *Journal of Consumer Research*, 1974(Sep), Vol 1(2), 30-35.—Describes a threshold model of binary attribute satisfaction decisions using M. Fishbein's attitude model components (1972). The model is used to determine when an attribute of a brand is seen as satisfactory by consumers, given measures describing both that brand and others. The construction of hypothetical decision nets is discussed, and the variable of degree of conviction is related to the outcome of various satisfaction decisions. The model is tested using multivariate probit analysis and is supported by the data. Implications for attitude research and statistical methodology are discussed. (18 ref)—*Journal abstract.*

6273. Blood, Milton R. (Georgia Inst of Technology) **Spin-offs from behavioral expectation scale procedures.** *Journal of Applied Psychology*, 1974(Aug), Vol 59(4), 513-515.—Notes that behavioral expectation scale procedures have been used to construct performance evaluations in a variety of work settings. With slight modifications the procedures can also be used to provide information to organizations for evaluating performance, developing training programs, and assessing agreement on and communication of organizational policy.

6274. Britt, David W. & Galle, Omer. (Florida Atlantic U) **Structural antecedents of the shape of strikes: A comparative analysis.** *American Sociological Review*, 1974(Oct), Vol 39(5), 642-651.—Comparison of

2 models supports the conclusions that variations in the size of plants and industries affect the degree to which short, broad strikes are effective, and that the impact of unionization variables is best interpreted in terms of their ability to overcome economic disincentives against striking. (27 ref)

6275. Davis, Harry L. & Rigaux, Benny P. (U Chicago, Graduate School of Business) **Perception of marital roles in decision processes.** *Journal of Consumer Research*, 1974(Jun), Vol 1(1), 51-62.—Influence exerted by husbands and wives at different stages in the decision process was examined for 25 economic decisions in a convenience sample of Belgian households in which both spouses were questioned. Results indicate that while no differences were apparent in average relative influence, the phase of information search was characterized by considerably more role specialization than either of the other 2 phases (problem recognition and final decision) for almost all of the products studied. Implications are discussed in relation to communication strategies as well as for research on household economic behavior. (39 ref) —*Journal abstract.*

6276. Demby, Emanuel. **Psychographics and from whence it came.** In W. D. Wells (Ed), *Life style and psychographics*. Chicago, IL: American Marketing Assn, 1974. viii, 363 p.—Discusses the past, present, and future uses of psychographics in consumer-oriented marketing research. Guidelines for the construction and execution of psychographic studies are presented in terms of 3 classes of psychographic variables—product attributes, consumer life-styles, and psychological concepts, interests, and opinions. (26 ref)

6277. Ferber, Robert & Chao Lee, Lucy. (U Illinois) **Husband-wife influence in family purchasing behavior.** *Journal of Consumer Research*, 1974(Jun), Vol 1(1), 43-50.—Investigated the extent to which husbands and wives in recently married couples (1968) exert independent influences on the financial behavior of the couple. Ss have also been interviewed approximately every 6 mo since the fall of 1968. Specifically, focus was placed on (a) the role husbands and wives play in money management, (b) the factors that determine which partner plays the principal role in money management, and (c) the differences between various aspects of family financial behavior if the dominant role is exerted by the husband or by the wife. Using the concept of a family financial officer (FFO), results indicate that, by the end of the 2nd yr of marriage, the FFO was the wife in over one-third of the families, the couple was acting jointly in about the same proportion, and in slightly over one-fourth of the families the FFO was the husband. However, if the husband was the FFO, the couple was more likely to save a higher proportion of income and in variable dollar forms, and to purchase automobiles less frequently.—*Journal abstract.*

6278. Fry, Joseph N. & McDougall, Gordon H. (U Western Ontario, School of Business Administration, London, Canada) **Consumer appraisal of retail price advertisements.** *Journal of Marketing*, 1974(Jul), Vol 38(3), 64-67.—Studied the influence of communicators (retail stores) and messages (price reductions on major consumer durables) advertised through 1 channel (newspaper), in an attempt to determine whether consumers

thought (a) that the stated regular price in an ad was, in fact, the regular price at that store and/or competitive stores, and (b) that the stated sale price was the best deal in town. It was hypothesized that consumer reaction would be a function of the retailer (source credibility) and 2 audience characteristics, shopping experience at the store and social class. Sample was 332 housewives in an urban area. Consumer reactions to price ads were influenced by source, message, and shopping experience. Social class was not a factor. Some consumers indicated a general distrust of sales, but most of them had specific reasons for not accepting advertised claims. Evaluations were based on experiences concerning the store, perceived knowledge of prices, discounts, and perceived shopping ability.—*D. Tweed.*

6279. Frye, Robert W. & Klein, Gary D. (California State U, Long Beach) **Psychographics and industrial design.** In W. D. Wells (Ed), *Life style and psychographics*. Chicago, IL: American Marketing Assn, 1974. viii, 363 p.—Reports a study to determine whether psychographic data could be more effective in explaining product design preference behavior than demographic data. Data from consumer ratings of 5 radios designed to meet psychographic descriptions and 5 designed to meet the demographic descriptions of the consumer panel show that the psychographic specifications produced the highest-rated radio. The potential of psychographics to reduce trial-and-error product tests and to measure the results of the design process is noted.

6280. Gliszczynska, Xymena. (Polish Academy of Sciences, Warsaw) **A decisional model of worker motivation.** *Polish Psychological Bulletin*, 1974, Vol 5(2), 93-98.—Developed a model of worker motivation as a result of a critical examination of the earlier model product of the human relations doctrine. The proposed model assumes that a given behavior of the worker is either reinforced or extinguished by experience, a mediating role in this process being played by the worker's expectancy as to the consequences of his behavior. Productivity is viewed as a means for the attainment of goals which are of value in the given social environment. The model is based on concepts similar to the principal concepts of decision making theory (i.e., subjective probability and expected value, as the product of incentive and motive). The concept of reinforcement, derived from learning theory, is defined as agreement between attained value and expected value.—*Journal abstract.*

6281. Hodock, Calvin. **Use of psychographics in analysis of channels of distribution.** In W. D. Wells (Ed), *Life style and psychographics*. Chicago, IL: American Marketing Assn, 1974. viii, 363 p.—Describes various forms of product distribution (e.g., supermarkets, mail order department stores, and discount stores), some recent changes in major distribution systems, and how these changes were both the cause and effect of changes in life-styles. Some common factors in different distribution strategies are identified, and the use of psychographic research findings in developing new distribution channels is discussed.

6282. Hustad, Thomas P. & Pessemier, Edgar A. **The development and application of psychographic life style and associated activity and attitude measures.** In W. D.

Wells (Ed), *Life style and psychographics*. Chicago, IL: American Marketing Assn, 1974. viii, 363 p.—Presents an introduction to life-style (i.e., psychographic) research, including a taxonomy of consumer measurements and their applications, alternative research strategies, and some problems and prospects in activity and attitude investigations. The validity and reliability of various consumer research methodologies are discussed, and problems in implementation of some strategies in an actual market setting are noted. (49 ref)

6283. Jacoby, Jacob; Speller, Donald E. & Berning, Carol K. (Purdue U) **Brand choice behavior as a function of information load: Replication and extension.** *Journal of Consumer Research*, 1974(Jun), Vol 1(1), 33-42.—Based a study of 192 housewives on the hypothesis that there are finite limits to the ability of human beings to assimilate information during any given limit of time, and that once these limits are surpassed, behavior tends to become confused and dysfunctional. The theory was tested by operationalizing information in terms of number of brands and amount of information per brand provided for rice and prepared dinners. Results confirm the hypothesis, and suggestions for future studies are provided. (31 ref)—*Journal abstract*.

6284. Jordaan, Jean P. & Super, Donald E. (Teachers Coll, Columbia U) **The prediction of early adult vocational behavior.** In D. F. Ricks, A. Thomas & M. Roff (Eds), *Life history research in psychopathology: III*. Minneapolis, MN: University of Minnesota Press, 1974. x, 383 p.

6285. Katona, George. **Psychology and consumer economics.** *Journal of Consumer Research*, 1974(Jun), Vol 1(1), 1-8.—Presents a psychological analysis of consumers' spending and saving behavior in response to inflation, recession, or increased assets and inventories where findings differ from generalizations presented by traditional economic analysis.

6286. Landon, E. Laird. (U Colorado, Coll of Business) **Self concept, ideal self concept, and consumer purchase intentions.** *Journal of Consumer Research*, 1974(Sep), Vol 1(2), 44-51.—179 male and 173 female undergraduates rated his or her self-image, ideal self-image, and purchase intentions for a list of 12 and 7 products, respectively. It was hypothesized that self-image and ideal self-image would be equally correlated with purchase intentions, that some Ss would show a dominant influence of self-image correlation over all products used (an actualizing tendency) and that some Ss would show a dominant influence of ideal self-image (a perfection tendency). Results show that (a) self-image and ideal self-image tended to be positively correlated, (b) over all Ss, purchase intentions tended to be correlated with self-image rather than with ideal self-image, and (c) purchase intentions of some products were more correlated with ideal self-image than with self-image. The actualizing and perfection tendencies did not entirely explain all the data; it appears that factors important determinants of the relative differential impact of self-image and ideal self-image on purchase intentions. (27 ref)—*L. Gorsev*.

6287. Lovell, Mark. (Leo Burnett-LPE, London, England) **European developments in psychographics.** In

W. D. Wells (Ed), *Life style and psychographics*. Chicago, IL: American Marketing Assn, 1974. viii, 363 p.—Reviews recent European studies of life-style and psychographic characteristics and presents an example of a large psychographic study in which the author was engaged. Methodological differences between US and European studies are noted, and problems common to psychographic studies in all countries are discussed. (19 ref)

6288. Morrison, Robert F. & Arnold, Stephen J. (U Toronto, Faculty of Management Studies, Ontario, Canada) **A suggested revision in the classification of nonprofessional occupations in Holland's theory.** *Journal of Counseling Psychology*, 1974(Nov), Vol 21(6), 485-488.—Reports that, in a test among 268 males in 4 mining occupations (laboratory, process, extraction, and mining), J. L. Holland's theory of vocational choice was not as predictive as previously demonstrated for professional and technical occupations. Contrary to Holland's theory, the 4 groups which were classified within the realistic type did not exhibit similar personalities. Significant differences were found between the 4 groups on 16 of 38 life history questionnaire items, and only 3 of 8 tested traits supported the classification of all 4 nonprofessional occupational groups into the realistic type. It is suggested that data from members of nonprofessional occupations may be used to test and revise Holland's primary classification of these occupations. (15 ref)—*Journal abstract*.

6289. Morrison, Robert F. & Sebald, Maria-Luise. (U Toronto, Faculty of Management Studies, Ontario, Canada) **Personal characteristics differentiating female executive from female nonexecutive personnel.** *Journal of Applied Psychology*, 1974(Oct), Vol 59(5), 656-659.—Conducted a study of personal characteristics differentiating employed executive and nonexecutive women in a large metropolitan area. 39 pairs of Ss, matched on age, education, work site, length of employment, and other similar variables were differentiated on level achieved (organization status and policy contribution). All Ss completed the Weissman Personnel Classification Test and the Edwards Personal Preference Schedule. The executive group was significantly higher in (a) the self-esteem component of need for achievement, (b) the need for power, and (c) mental ability. Significant differences between the pairs were not found in variables designed to contrast early socialization processes, marital environment, and the need for affiliation.—*Journal abstract*.

6290. Mueller, Charles W. (U Iowa) **City effects on socioeconomic achievements: The case of large cities.** *American Sociological Review*, 1974(Oct), Vol 39(5), 652-667.—Used data from probability samples in 15 of the largest US cities to examine the possible causal influence of community context on an individual's occupational status attainment and income. Findings suggest that across large US communities the processes by which socioeconomic statuses are achieved are homogeneous, and city contextual differences are relatively unimportant. (24 ref)

6291. Myers, James H. & Gutman, Jonathan. (U Southern California, Graduate School of Business Administration) **Life style: The essence of social class.** In W. D. Wells (Ed), *Life style and psychographics*.

- Chicago, IL: American Marketing Assn, 1974. viii, 363 p.—Argues that the social class construct is only a subset of the indicators of life-style and that it has meaning primarily to the extent that it is separated from family income. The number and distribution of social classes, methods of measuring social class consumer behavior, market applications of the social class construct, and a study of the relationship of large numbers of life-style items to a social class index are also discussed. (33 ref)
6292. Nakanishi, Masao; Cooper, Lee G. & Kassarian, Harold H. (U California, Graduate School of Management, Los Angeles) **Voting for a political candidate under conditions of minimal information.** *Journal of Consumer Research*, 1974(Sep), Vol 1(2), 36-43.—Describes the modification of various models developed to measure market share to account for variables in the selection of a political candidate and to predict voting behavior. Data indicate that the interactive brand share type model is superior in predicting elections and that the critical variables in the selection of a political candidate to an unimportant office were endorsements and not having a recognizable female name.
6293. Ostlund, Lyman E. (U Pennsylvania, Wharton School) **Perceived innovation attributes as predictors of innovativeness.** *Journal of Consumer Research*, 1974(Sep), Vol 1(2), 23-29.—Reports 2 studies that apply diffusion theory to 2 new consumer products. The research objective in both studies was to discriminate buyers from nonbuyers using the personal characteristics of respondents and their perceptions of each new product and also to assess the relative importance of the predictor variables. Data from 2 samples of housewives show that in both studies perceptual variables (e.g., relative advantage of the new product, perceived risk, complexity, observability, and compatibility) were far more successful as predictors of the purchase outcome than respondent personal characteristics. (17 ref) —*Journal abstract.*
6294. Pernica, Joseph. **The second generation of market segmentation studies: An audit of buying motives.** In W. D. Wells (Ed), *Life style and psychographics*. Chicago, IL: American Marketing Assn, 1974. viii, 363 p.—Discusses the procedures, rationale, and validity of market segmentation studies which use inverse factors analysis (the Q-technique) to divide consumers of a single product into segments based on psychographic and life-style characteristics. A general model of consumer motivation is described, and case examples of the usefulness of the Q-technique are presented.
6295. Porter, Lyman W.; Lawler, Edward E. & Hackman, J. Richard. (U California, Irvine) **Behavior in organizations.** New York, NY: McGraw-Hill, 1975. xiv, 561 p.—Presents an introduction to the study of behavior in organizations, emphasizing the individual, the organization, and their interaction in work situations. Topics include choice, adaptation, and developmental processes in individual-organization relationships; structural and social factors in work behavior; and ways of improving organizational effectiveness. (22½ p ref)
6296. Reynolds, Fred & Darden, William. (U Georgia, Coll of Business Administration) **Construing life style and psychographics.** In W. D. Wells (Ed), *Life style and psychographics*. Chicago, IL: American Marketing Assn, 1974. viii, 363 p.—Reviews G. A. Kelly's theory of personal constructs and describes how it is applicable to and can be used to discriminate between "life-style" and "psychographics" as fields of inquiry. How the theory can also provide guidance when choosing between product or brand attributes and more generalized types of items in the construction of psychographic questionnaires is also described. (35 ref)
6297. Reynolds, Fred D. (U Georgia, Coll of Business Administration) **An analysis of catalog buying behavior.** *Journal of Marketing*, 1974(Jul), Vol 38(3), 47-51.—Explored 3 factors that affect catalog buying behavior: convenience, offering, and degree of risk. Findings are based on a mail survey of 1,099 Georgia housewives, with a 27% return. Catalog buyers report higher income, tend to be younger, more venturesome, and more self-confident. They are also more likely to have children under 12 yrs old. It is concluded that retailers need to understand the in-home market better and should personalize to a greater degree the promotion directed at that market.—*D. Twedt.*
6298. Rohles, Frederick H. (Kansas State U) **The modal comfort envelope and its use in current standards.** *Human Factors*, 1974(Jun), Vol 16(3), 314-322.—Exposed 1,600 Ss, in groups of 5 men and 5 women each, to 20 dry-bulb temperatures at each of 8 relative humidities. From this study, 15 temperature-humidity conditions were selected and identified as the Modal Comfort Envelope (MCE). Within this envelope, 94% of the Ss were either slightly cool, comfortable, or slightly warm; 3% were cool and 3% were warm; and none were hot or cold. To validate these findings, a new sample of 150 Ss was tested, and the results agree favorably with the original findings. The MCE was used in a clothing study and in an investigation of thermal comfort in the elderly; results of these studies are discussed, together with suggestions for the use of the MCE as a tool for examining the thermal sensation as a function of such nonthermal factors as lighting, S density, sex, and activity.—*Journal abstract.*
6299. Scherf, Gerhard W. (U Guelph, Ontario, Canada) **Consumer dissatisfaction as a function of dissatisfaction with interpersonal relationships.** *Journal of Applied Psychology*, 1974(Aug), Vol 59(4), 465-471.—An application of C. P. Alderfer's existence, relatedness, and growth theory (see PA, Vol 43:13656) investigated whether frustrated relatedness needs result in additional consumer existence needs, which in turn produce consumer dissatisfaction. A study of 306 randomly chosen consumers indicates that a decrease of Ss' ratings of satisfaction in their relations with "significant others" and with people at the place of employment was correlated with an increasing desire for more items of material value in the consumer role. Some correlations reached higher statistical significance when respondents of the lowest income group and those of both the oldest and the youngest age categories were eliminated from the sample. Higher incomes correlated positively with existence need satisfaction. Results support Alderfer's theory.—*Journal abstract.*
6300. Thompson, Charles W. & Rath, Gustave J. (Northwestern U) **The administrative experiment: A**

**special case of field testing of evaluation.** *Human Factors*, 1974(Jun), Vol 16(3), 238-252.—Describes a strategy and method of field testing or evaluation called administrative experimentation. The method is defined in terms of its relation to other methods and its potential strengths and limitations, and case studies of its use are presented to provide a basis for evaluating its usefulness. (18 ref)

6301. **Villemez, Wayne J.** (Florida Atlantic U) **Ability vs. effort: Ideological correlates of occupational grading.** *Social Forces*, 1974(Sep), Vol 53(1), 45-52.—Investigated the relationship between occupational prestige, the level of ability perceived as necessary to perform a job, and the amount of effort perceived as necessary to perform it. Data from 168 undergraduates who rated 120 occupations on these variables indicate that the level of ability and the amount of effort perceived as necessary to perform a job are strongly related to the prestige continuum, but which is paramount varies with self-perception of individual capabilities in terms of the effort-ability continuums. Findings support 3 conclusions: (a) The argument that consensus on prestige does not indicate consensus as to distributive justice is not supported. (b) In areas characterized by a high degree of the division of labor, the effort-ability distinction becomes cloudy. (c) Because of egocentrism in occupational grading, the use of prestige or prestige-related categories does not seem justified in studies where interest is focused on individual attributes or attitudes. (34 ref)—*Journal abstract.*

6302. **Ward, Scott.** (Harvard U, Graduate School of Business Administration) **Consumer socialization.** *Journal of Consumer Research*, 1974(Sep), Vol 1(2), 1-14.—Traces the development of interest in consumer socialization. Major policy and conceptual issues are posed, and research in several areas of study is reviewed. Directions for research are specified in 3 key areas: consumer socialization processes, content of learning, and permanence of early learning. Interest in consumer socialization has developed largely due to contemporary issues relating to corporate and public policy formation. Research goals should center around developing the information-processing capabilities of consumers or around ultimate consumer effectiveness in families. (85 ref)—*Journal abstract.*

6303. **Welgart, Kathleen M.** **Stratification, ideology, and opportunity beliefs among black soldiers.** *Public Opinion Quarterly*, 1974(Spr), Vol 38(1), 57-68.—While many social observers feel that the military offers blacks better opportunities than civilian institutions do, the overwhelming majority of the 454 black soldiers sampled in this study either equated the 2 sectors or rated civilian institutions as superior. Both position in the military hierarchy (rank) and ideological orientation (separatist, pluralist, or assimilationist) provide some assistance in differentiating those soldiers more likely to cite the military as comparatively advantageous for blacks. (21 ref)—*Journal abstract.*

6304. **Wells, William D. (Ed.).** (U Chicago, Graduate School of Business) **Life style and psychographics.** Chicago, IL: American Marketing Assn, 1974. viii, 363 p.

6305. **Wells, William D.** (U Chicago, Graduate School of Business) **Life style and psychographics: Definitions,**

**uses and problems.** In W. D. Wells (Ed), *Life style and psychographics*. Chicago, IL: American Marketing Assn, 1974. viii, 363 p.—Discusses the question of definitions in life-style and psychographic research, the use of psychographic methods in advertising campaigns, product positioning, preference assessment, and market segmentation; the relationship between psychographics and media; and theoretical and methodological problems in translating from psychographic data to marketing decisions. (79 ref)

6306. **Wind, Jerry & Green, Paul.** (U Pennsylvania, Wharton School) **Some conceptual, measurement, and analytical problems in life style research.** In W. D. Wells (Ed), *Life style and psychographics*. Chicago, IL: American Marketing Assn, 1974. viii, 363 p.—Discusses several questions related to the methodology of life-style and psychographic research, including the role of life-style in marketing research as related to criterion variable set; problems associated with the construct, indicators, and validation of life-style; and the influence of response bias, the respondent's frame of reference, and data collection procedures on life-style indicators. (51 ref)

#### Occupational Guidance & Personnel Selection & Training

6307. **Arvey, Richard D. & Mussio, Stephen J.** (U Tennessee, Coll of Business Administration) **A validation strategy for the "nonsample."** *Professional Psychology*, 1974(Aug), Vol 5(3), 264-266.—Presents a method of nondiscriminatory employment test validation when there are no minority personnel in jobs being considered. A test battery is validated with the Caucasian employees and then administered to an applicant pool containing a high proportion of minority group members. If differences between racial groups emerge, discriminatory items are ascertained by item analysis and deleted. If no differences appear (as in the case reported), the battery is standardized with on-the-job minority personnel.—C. Wright.

6308. **Baker, Larry D.** (U Missouri, School of Business Administration, St Louis) **Authoritarianism, attitudes toward blindness, and managers: Implications for the employment of blind persons.** *New Outlook for the Blind*, 1974(Sep), Vol 68(7), 308-314.—A review of the literature indicates that some employers express positive attitudes toward the capabilities of blind persons but are unwilling to hire them. One factor which may explain this reluctance is the authoritarian personality characteristics of some employers. High authoritarians tend to hold more negative attitudes toward the blind and may hold or aspire to important decision- and policy-making positions in organizations. It is suggested that organizations in the economic system may foster the development or promotion of persons who are most likely to hold negative attitudes toward blind persons to positions where decisions affecting the employment of the blind are made. Suggested areas of research are presented (e.g., recruitment and selection policies for blind persons). (35 ref)—*Journal abstract.*

6309. **Britton, Jean O. & Thomas, Kenneth R.** (Pennsylvania State U) **Age and sex as employment variables: Views of employment service interviewers.**

*Journal of Employment Counseling*, 1973(Dec), Vol 10(4), 180-186.—Studied the perceptions of 56 23-67 yr old employment interviewers regarding the worker characteristics of males and females of varying ages. Results showed that significant main effects due to age were obtained on 6 questions: how difficult workers would be to place in jobs during an economic recession, how difficult they would be for an employer to train, how slow they would be in maintaining production schedules, how accident-prone they would be on the job, how frequently they would be absent from work, and how likely they would be to have the skills an employer would want. 50-yr-olds were seen as the most and 25-yr-olds as the least difficult to place and train, while 18-yr-olds were seen as the most likely to have accidents and to be absent, and as the least likely to have desired skills. Females were seen as more likely than males to be frequently absent and less likely than males to have the skills an employer would want.—*Journal abstract*.

6310. Cassel, Russell N. & Stroman, Samuel D. (U Wisconsin, Milwaukee) Evaluation of the UMW Computerized Decision Development System for use with ROTC students. *Journal of Instructional Psychology*, 1974(Win), Vol 1(1), 12-22.—Used the Computerized Decision Development System (DEDEV) with 63 students to determine the validity of the system and the Ss' attitude toward it. Results show that DEDEV was effective in teaching Ss the psychology of decision-making; Ss felt that it was useful for the preparation of officers.

6311. Cauley, William J. The fully functioning employment service counselor. *Journal of Employment Counseling*, 1974(Sep), Vol 11(3), 118-122.—Defines fully functioning employment service counselors as individuals who feel personally and professionally significant and who use personal and professional competencies to foster an accurate image of themselves with clients and other professionals within the employment service. They are aware of the changing demands and the expanding scope and goals of employment counseling occurring over the past 10 yrs, although many others in the employment service, including training and supervising counselors, are not. These counselors must take the responsibility for bringing others into their scope of awareness and must define, through their own actions, their developing identity.—*Journal abstract*.

6312. Cecil, Earl A.; Paul, Robert J. & Olins, Robert A. (U Missouri) Perceived importance of selected variables used to evaluate male and female job applicants. *Personnel Psychology*, 1973(Fall), Vol 26(3), 397-404.—118 graduate and undergraduate students were presented a list of 50 variables and asked to rank each variable on a modified Likert-type scale. Some variables were judged more important for the potential female applicant for a white-collar job: pleasant voice, clerical skills, high school degree, computational skills, immaculate dress, and ability to express self well. Other variables were judged more important for the male applicant: flexibility, persuasiveness, ability to work under pressure, motivation, and aggressiveness. It is concluded that females might experience greater difficulty than their male counterparts in finding managerial

work. Males might have difficulty securing a typical clerical position.—R. S. Albin.

6313. Chatterji, Sibabrata & Mukerjee, Manjula. (Indian Statistical Inst, Calcutta) Group task and its use as measure of personality in selection situation. *Japanese Psychological Research*, 1974(May), Vol 16(1), 22-28.—Considers that personality determines the behavior of a person to a large extent and that, therefore, care should be taken when selecting suitable candidates for jobs or training. Data were collected from 41 groups of 10 graduate management students each to determine the relation between job performance and several personality traits measured through group tasks conducted at the time of selection. Results show that the job performance of individuals with the required level of ability would be satisfactory provided they possess certain personality traits (e.g., application and leadership).—*Journal abstract*.

6314. Ehrle, Raymond A. (George Washington U) Between boredom and terror: The credibility and survival of the professional. *Journal of Employment Counseling*, 1974(Sep), Vol 11(3), 113-117.—Considers that, as fewer opportunities become available for private practice on the part of the professional employment counselor, his situation becomes one of terror in maintaining continuous credibility or of boredom by bureaucratic stagnation. Suggestions for dealing with these 2 undesirable alternatives while maintaining a standard of excellence are briefly discussed.

6315. England, George W. & Lee, Raymond. (U Minnesota) The relationship between managerial values and managerial success in the United States, Japan, India, and Australia. *Journal of Applied Psychology*, 1974(Aug), Vol 59(4), 411-419.—Investigated the relationships between managerial values and managerial success for a diverse sample of 878 American managers, 301 Australian managers, 500 Indian managers, and 312 Japanese managers. Cross-validated results show that value patterns were significantly predictive of managerial success and could be used as a basis for selection and placement decisions. Results also indicate that managers from the 4 countries were rather similar in terms of the personal values that were related to success. More successful managers had pragmatic, dynamic, and achievement-oriented values, while less successful managers had more static and passive values. Arguments for and against using value assessment results in selection and placement decisions are discussed. (31 ref)—*Journal abstract*.

6316. Hagin, William V. & Smith, James F. Advanced simulation in underground pilot training (ASUPT) facility utilization plan. *US AFHRL Technical Report*, 1974(Jun), No 74-43, 36 p.—Describes the capabilities of a flight simulation research facility located at Williams Air Force Base, Arizona. Research philosophy to be applied is discussed, and long range and short range objectives are identified. A time-phased plan for long range research accomplishment is described. In addition, some examples of near-term research efforts which will be conducted during periods when the total system is not available are described in some detail. These projects address immediate simulator user's needs.—*Journal abstract*.

6317. Jennings, J. Richard; Rose, R. M. & Kreuz, Leo. (Walter Reed Army Inst of Research, Washington, DC) **Stress and performance during and after Officer Candidate School.** *Journal of Applied Psychology*, 1974(Aug), Vol 59(4), 500-503.—Related military performance during and after Officer Candidate School (OCS) to interview and questionnaire measures of stress and personality (e.g., the Marlowe-Crowne Social Desirability scale). A company of 69 candidates was studied early in training, just prior to graduation, and after 6 mo on duty as officers. It was found that psychiatric interview ratings of stress and change in coping style related to class standing in OCS but not to subsequent military performance. Personality and maturational variables were related to performance after OCS. Motivational distortion by candidates and initial impression formation by superior officers appeared to be factors in determining OCS class standing.—*Journal abstract*.

6318. Kauffman, Stephen P. & Dwyer, Francis M. (SUN Area Vocational School, New Berlin, PA) **Effectiveness of cartoons and photographs in in-service training.** *California Journal of Educational Research*, 1974(Sep), Vol 25(4), 197-204.—Investigated the relative effectiveness of different types of visual illustrations used to complement instruction presented in inservice training programs. Ss were 70 college students in an instructional media course, 56 "preprofessional" state employees (i.e., those employees without an undergraduate or 3-yr nursing degree), and 53 professional state employees. Each S received a pretest, participated in 1 of 2 instructional presentations (which varied only in whether the cartoons and photographs were in color or black and white), received a criterion test, and responded to a visual preference survey. Results indicate that, in general, cartoons were more effective than realistic photographs in facilitating S's achievement on immediate and delayed retention tests. However, identical visuals were not equally effective in facilitating achievement in the 3 groups of Ss. A majority of Ss in each group indicated that they learned more from the cartoon presentation and would prefer to receive instruction complemented by cartoons rather than by realistic photographs.—*Journal abstract*.

6319. Lawrence, Richard E. & Stern, Herbert. (U Maryland) **A training program to prepare agency counselor-interviewers.** *Journal of Employment Counseling*, 1973(Dec), Vol 10(4), 168-172.—Describes a training program conducted with selected regular employees of a federal agency to prepare them to serve as counselor-interviewers in the upgrading process. Data from the evaluation of communication patterns and recommendations for similar programs are presented.

6320. Lawrence, Richard E. (U Maryland) **A theory, philosophy, and practice for the employment counselor.** *Journal of Employment Counseling*, 1974(Sep), Vol 11(3), 107-112.—Discusses the need for an adequate definition and theory of counseling in view of the many pressures on employment counselors to provide personal problem counseling (e.g., role definition and decision-making suggestions) for job applicants. A specific approach to counseling, based on existential philosophy, is described.

6321. McLaughlin, Donald H. & Tiedeman, David V. (American Inst for Research, Palo Alto, CA) **Eleven-year career stability and change as reflected in Project Talent data through the Flanagan, Holland, and Roe occupational classification systems.** *Journal of Vocational Behavior*, 1974(Oct), Vol 5(2), 177-196.—Investigated the extent of career stability and the patterns of career change which have occurred in the lives of Project TALENT 12th-grade male students in the 11 yrs since they were tested. "Career" plans in the last year of high school and at 1, 5, and 11 yrs after testing were classified by the Flanagan, Holland, and Roe occupational classification systems to study the career stability and patterning within each system. Career stability was about the same in all 3 classification systems but decreased in all cases as the interval over which it was measured increased. Career stability increased as Ss grew older, proving to be the greatest from 5 to 11 yrs after high school. Patterns of change mildly conformed to the circular patterns claimed by Holland and Roe for their systems and the linear pattern hypothesized for the Flanagan system. Generally, the direction of "career" flow was away from intellectual careers to careers in business and sales but each system had unique results as well.—*Journal abstract*.

6322. Meyer, David P. (US Dept of Labor, Manpower Administration, Washington, DC) **The Widget Syndrome.** *Journal of Employment Counseling*, 1974(Sep), Vol 11(3), 101-106.—Discusses the recent tendency in manpower administration to view human services in mechanistic terms. This Widget Syndrome tends to cause an emphasis on large numbers of transactions as a measure of effectiveness. An analysis of the placement process is presented which stresses the psychological components of job-seeking and distinguishes between placement and finding suitable jobs for people. A "scientific method" of placement is described which enables job counselors to determine differences among groups of applicants who obtained and did not obtain employment and to develop policies for dealing with the unemployed.—*L. Gorsey*.

6323. Nagle, George S. (Armed Forces Inst, Madison, WI) **Number of contacts with disadvantaged applicants as an indicator of success.** *Journal of Employment Counseling*, 1973(Dec), Vol 10(4), 203-207.—Studied the number of contacts with disadvantaged applicants in a medium-sized employment service office and their relation to success. Most of the 333 applicants were served by 5 contacts. Results indicate that success occurs in from 3 to 5 contacts and failure occurs beyond 7 contacts. Re-evaluation of service plans for applicants carried beyond 5 contacts is suggested.—*Journal abstract*.

6324. Phelps, R. J.; Peer, Gary G. & Canada, Richard M. (Indiana U) **Training employment service personnel in basic counseling skills.** *Journal of Employment Counseling*, 1973(Dec), Vol 10(4), 173-179.—Describes the results of a 2-yr paraprofessional training program in basic counseling skills for 29 employment service interviewers. Trainees evidenced a significant decrease in closed-mindedness as assessed by the Rokeach Dogmatism Scale, and changes in types of counselor responses as measured by the Porter Test of Counselor Attitudes.

6325. Robinson, David D.; Wahlstrom, Owen W. & Mecham, Robert C. Comparison of job evaluation methods: A "policy-capturing" approach using the Position Analysis Questionnaire. *Journal of Applied Psychology*, 1974(Oct), Vol 59(5), 633-637.—Used a policy-capturing method of job evaluation, which involved the multiple regression weighting of numerical job analysis data obtained using the Position Analysis Questionnaire (PAQ), to predict compensation rates in 2 studies. In Study 1 compensation rates were derived and compared for 19 municipal government jobs using the policy-capturing and 4 conventional methods. The rates derived using the 5 methods intercorrelated between .82 and .95. In Study 2 PAQ data and job evaluation points previously determined using a point method were obtained for 131 jobs in a utility company. A stepwise regression analysis, used to select and weight PAQ factor scores to predict the job evaluation points, yielded a multiple correlation of .90. Because of comparable results and lower cost, the policy-capturing method was adopted in both organizations. (18 ref)—*Journal abstract*.
6326. Rosen, Benson & Jerdee, Thomas H. (U North Carolina, Graduate School of Business Administration) Effects of applicant's sex and difficulty of job on evaluations of candidates for managerial positions. *Journal of Applied Psychology*, 1974(Aug), Vol 59(4), 511-512.—To investigate the influence of sex-role stereotypes on evaluations of candidates for managerial positions, 235 male undergraduate business students evaluated job applicant forms which differed only in the male or female name given to the applicant. Findings confirm that sex-role stereotypes influence evaluations of applicants and selection decisions. Male applicants were accepted more frequently than equally qualified females, and were evaluated more favorably on general suitability, potential for long service, and potential for fitting in well in the organization. Also supported was the hypothesis that job demands have differential effects on evaluations of male and female applicants. Females were given lowest acceptance rates and poorest evaluation for "demanding" managerial positions.—*Journal abstract*.
6327. Schmidt, Frank L. (Michigan State U) Probability and utility assumptions underlying use of the Strong Vocational Interest Blank. *Journal of Applied Psychology*, 1974(Aug), Vol 59(4), 456-464.—Decision implications of E. K. Strong's (1955) assumption of equal base rates for his men-in-general and individual occupational groups are explored, using the Strong Vocational Interest Blank (SVIB) Physician's scale as an example. It is demonstrated that when realistic base rates are assumed, total decision error rate using the SVIB—even when optimal cutting scores are employed—is at best about equal to that resulting from prediction using base rates alone. Use of the SVIB as recommended by Strong implicitly assumes that false negative errors are much more serious than are false positives. When "reasonable" utility or gain matrices are assumed, use of the SVIB can reduce total error rate despite the limitations imposed by low occupational base rates; this effect is greater when statistically optimal cutting scores, rather than those recommended by Strong, are used. (15 ref)—*Journal abstract*.
6328. Schoenfeldt, Lyle F. (U Georgia) Utilization of manpower: Development and evaluation of an assessment-classification model for matching individuals with jobs. *Journal of Applied Psychology*, 1974(Oct), Vol 59(5), 583-595.—Describes a model for the assessment of individual characteristics, the identification of psychological requirements of jobs, and the classification of applicants to job opportunities. The validity of the model was investigated with 1,934 undergraduates. Subgroups, formed on the basis of previous behavioral data collected during the freshman year, differed with respect to criteria (e.g., arts-sciences vs applied studies and grade point average) measurements taken 4 yrs later. More importantly, the subgroups differed with respect to the curricular paths walked during college. Results indicate that it is possible to differentiate people in meaningful ways, to identify "job families," and to match people with jobs. (34 ref)—*Journal abstract*.
6329. Showalter, John M. & Bryant, Flora. (Ohio State U, Ctr for Vocational Technical Education) Use of job simulation kits with WIN enrollees. *Journal of Employment Counseling*, 1973(Dec), Vol 10(4), 192-196.—Describes the use of Job Experience Kits (J. D. Krumboltz et al), which measure interest in 21 occupations, with 122 disadvantaged adults in Work Incentive Programs. Data from administrations of the kits before and after Ss participated in a vocational orientation and assessment program support their value in facilitating the vocational decision-making process of adult clients.
6330. Sjödin, Karl-Göran & Glesecke, Cecilia. [A training evaluation system for officers and conscripts.] (Swed) *MPI A-Rapport*, 1974(Aug), No 27, 34 p.—Describes the rationale, procedures, and results of a training system for military personnel which is based on a feedback model and uses questionnaires and group discussions. Results from its use with 4 military units are presented. Findings indicate that training evaluation systems based on feedback to different levels in the training organization can be valuable in increasing the immediacy of information and making training procedures more efficient. The need to provide information about changes that have been made to insure that each individual is aware of his own job responsibilities is emphasized.—*English abstract*.

### Job Performance & Satisfaction

6331. Rasmussen, J. & Jensen, A. (Danish Atomic Energy Commission, Research Establishment Riso, Roskilde, Denmark) Mental procedures in real-life tasks: A case study of electronic trouble-shooting. *Ergonomics*, 1974(May), Vol 17(3), 293-307.—Analyzes verbal protocols to study the mental procedures used by skilled electronics repair men in their normal working environment. The procedures found are organized as a search through a system which is viewed as a hierarchy of subunits. Basically different types of recurrent search routines are found with great differences in respect to the number of observations needed and the complexity of the mental data processing involved. The records demonstrate an ability by the men to conduct the search by general routines depending upon their general professional background and a preference for rapid streams of simple decisions giving good or bad judgments.

ments regardless of whether observations are informationally redundant. The records indicate that the men have confidence that the general routines will ultimately lead them to the fault. In cases where they are unsuccessful, there seems to be a fixation resulting in a tendency to rely on repetitions rather than to generate specific procedures based on reasoning related to the functioning of the specific system. (German summary)—*Journal abstract*.

6332. Axelson, Olav. (Regionsjukhuset, Yrkesmedicinska kliniken, Örebro, Sweden) **Influence of heat exposure on productivity.** *Work-Environment-Health*, 1974, Vol 11(2), 94-99.—Proposes an approximate and computationally simple formula for the prediction of relative reduction in work capacity due to heat stress. The applicability of the proposed model was tested using experimental data on heart rates, sweat rates, and metabolic rates accounted for in the literature. The agreement between the predicted and observed values on productivity reduction was in most situations found to be fairly good. Recommendations for the air velocity parameter value and the temperature scale to be used are suggested. Consideration is also given to the nature of the basic data as well as to the need for complementary practical observations.—*Journal abstract*.

6333. Beck, Lawrence J. (San Jose State U) **The effect of spurious angular accelerations on tracking in dynamic simulation.** *Human Factors*, 1974(Aug), Vol 16(4), 423-431.—Investigated the effect of spurious simulator yaw motions on a pilot's control performance, and compared the efficiency of static and dynamic simulator tracking in previously unexamined vehicle dynamics. 12 healthy airline pilots served as Ss in a moving-base flight simulator under congruent-motion, spurious-motion, and no-motion conditions. Results indicate a significant increase in the amount of error with increasing levels of spurious motion during the initially administered series of trials. The influence of spurious motion, however, was absent in a 2nd series of trials. Data suggest that the Ss learned to compensate in their performance for the spurious inputs. Congruent visual and rotational cueing produced superior performance to that of tracking with visual information alone. (21 ref)—*Journal abstract*.

6334. Biersner, Robert J. & Ryman, David H. (US Navy Medical Neuropsychiatric Research Unit, San Diego, CA) **Prediction of scuba training performance.** *Journal of Applied Psychology*, 1974(Aug), Vol 59(4), 519-521.—296 trainees of the US Navy School for Divers Second Class completed a demographic questionnaire, a health inventory, and an attitude survey. Significant multiple correlations in a validation sample and in a cross-validation sample were obtained between these variables and a pass-fail performance criterion. Scales dealing with mental health and training apprehension were the most significant predictors.

6335. Courthéoux, Jean-Paul. (CNRS, Paris, France) **[From professional mobility to social mobility.]** (Fren) *Orientation Scolaire et Professionnelle*, 1974(Jan-Mar), No 1, 53-58.—Reports on the extent and direction of professional mobility based on data published by the French government. Included are rates of promotion and demotion for engineers and for untrained workers within

and outside the organization, and information about recruitment sources for upper and lower employee echelons. It is pointed out that in an upwardly mobile society a son working at the same level as his father may find himself in an inferior position socially.

6336. Eden, Dov & Leviatan, Uri. (Tel Aviv U, Israel) **Farm and factory in the kibbutz: A study in agricultural psychology.** *Journal of Applied Psychology*, 1974(Oct), Vol 59(5), 596-602.—Surveyed kibbutz communities with a mix of factory and farm jobs to study the effects of industrialization on work and workers while controlling for the effects of urbanization. Questionnaire responses of 476 workers in a representative sample of factories were compared to those of 175 workers in location-matched agricultural branches in 27 kibbutz collective settlements. Factory workers rated their jobs significantly lower than did farm workers on plant manager's leadership, opportunities for self-realization on the job, participation, control, peer relations, and information about the job. However, factory jobs were rated cleaner, easier, and more mental. Factory and farm workers were similar in outcome measures, including supervisory ratings of performance, job satisfaction, mental health, and alienation. (19 ref)—*Journal abstract*.

6337. French, Earl B.; Metersky, Morton L.; Thaler, David S. & Trexler, Jerome T. (Lehigh U) **Herzberg's two factor theory: Consistency versus method dependency.** *Personnel Psychology*, 1973(Fal), Vol 26(3), 369-375.—Tested whether results obtained by using an F. Herzberg (see PA, Vol 34:4849) type of written questionnaire are significantly different from those obtained when Herzberg's oral interview procedure is used. 25 male systems analysts and systems engineers were studied. Results were statistically similar whether using oral or written data collection techniques. These results are discussed in terms of criticism often directed at Herzberg's methods. It is concluded that it is possible to replicate Herzberg's methods by controlling crucial aspects in the experimental process. (15 ref)—*R. S. Albin*.

6338. Hadley, Robert G. (California State U, Los Angeles) **Comment on Locke's satisfiers and dissatisfiers among white-collar and blue-collar employees.** *Journal of Applied Psychology*, 1974(Aug), Vol 59(4), 507-508.—Contends that some methodological problems limit E. A. Locke's (see PA, Vol 51:10066) classification system for occupational satisfiers and dissatisfiers which distinguished between agent and event categories. An alternative classification system, taking into account the multiple determination of some events, is recommended.

6339. Heisler, W. J. (U Notre Dame) **A performance correlate of personal control beliefs in an organizational context.** *Journal of Applied Psychology*, 1974(Aug), Vol 59(4), 504-506.—Compared scores of 175 employees of a government agency on Rotter's Internal-External Control Scale to scores on an index of personal effectiveness composed of 5 factors indicative of success within a governmental occupational context: number of promotions, salary increases, and awards received; current salary; and grade differential. Employees with a greater belief in external control reported significantly lower personal effectiveness than those with a lesser belief in external control. When organizational rewards were perceived by agency members as skill-determined, the

relationship between environmental control beliefs and personal effectiveness increased, while the relationship was nearly zero when agency rewards were seen as chance-related.—*Journal abstract.*

6340. Herold, David M. (Georgia Inst of Technology, Coll of Industrial Management) **Interaction of subordinate and leader characteristics in moderating the consideration-satisfaction relationship.** *Journal of Applied Psychology*, 1974(Oct), Vol 59(5), 649-651.—Reports that the relationship between leader consideration and worker satisfaction varied for groups of subordinates reporting (a) different levels of need for independence and (b) supervisors with different levels of hierarchical influence. In 91 nonsupervisory industrial workers, relationships between consideration (measured by the Leader Behavior Description Questionnaire) and 3 facets of satisfaction were significantly positive for those subordinates low in independence who had supervisors low in influence and for subordinates high in independence who had supervisors high in influence. No significant relationships were found for the low-independence-high-influence and high-independence-low-influence groups. No support was found for previous findings that leaders' hierarchical influence alone moderates consideration-satisfaction relationships.—*Journal abstract.*

6341. Ilgen, Daniel R. & Seely, William. (Purdue U) **Realistic expectations as an aid in reducing voluntary resignations.** *Journal of Applied Psychology*, 1974(Aug), Vol 59(4), 452-455.—Realistic information about a situation into which 234 US military cadets were about to enter was presented to the new members after they had decided to join the organization, but before they reported to the organization. When compared to a control group of 234 cadets who received no such information, the experimental group showed significantly lower turnover. The results are discussed in reference to the functions served by realistic job information available to new members after they have accepted a position with an organization.—*Journal abstract.*

6342. Karp, H. B. & Nickson, Jack W. (Old Dominion U, School of Business Administration) **Motivator-hygiene deprivation as a predictor of job turnover.** *Personnel Psychology*, 1973(Fal), Vol 26(3), 377-384.—Tested motivator-hygiene theory as a predictive tool for job turnover. 50 black working poor people (sex not specified) were selected because of their low level of job stability and interviewed according to F. Herzberg's methodology. Each S then completed a job motivation inventory (R. Kahoe, 1966). The hypothesis stating that this sample would perceive motivators as a source of satisfaction and hygiene as a source of dissatisfaction was confirmed. It is concluded that motivator and hygiene deprivation do predict job turnover because they indicate how much satisfaction and dissatisfaction are actually perceived on an existing job. Positive correlations were also found between motivator deprivation and hygiene deprivation.—*R. S. Albin.*

6343. Kempner, T. & Wild, Ray. **Job design and productivity.** *Journal of Management Studies*, 1973(Feb), Vol 10(1), 62-81.—Studied the relationship between job design and worker productivity to obtain a systematic body of knowledge concerning general principles of job design. These studies were conducted among unskilled

female manual workers in the electronics industry in Great Britain. Survey techniques were used to determine the relationships among job satisfaction, community attitudes, and biographical data on factors such as labor turnover and job attitude. Results indicate that job satisfaction is significantly influenced by and influences these variables. Greater quantitative precision in the assessment of the relationships between job design and productivity will depend on advances in the measurement of these variables. (17 ref)—*R. A. Levit.*

6344. Klimoski, Richard J. & London, Manuel. (Ohio State U) **Role of the rater in performance appraisal.** *Journal of Applied Psychology*, 1974(Aug), Vol 59(4), 445-451.—Notes that ratings for performance appraisal are frequently made by supervisors. In the present study, judgments of effectiveness for 153 hospital nurses were obtained from the nurse herself and her peers in addition to her supervisor, using the same rating form. Factor analysis indicated that each rating source could be clearly identified and characterized. The data reaffirm the notion that interrater disagreement may reflect systematic rater bias as well as meaningful differences in the ways in which judgments are made. Implications for comprehensive appraisals are suggested. (29 ref)—*Journal abstract.*

6345. Lee, Raymond & Booth, Jerome M. **A utility analysis of a weighted application blank designed to predict turnover for clerical employees.** *Journal of Applied Psychology*, 1974(Aug), Vol 59(4), 516-518.—Demonstrated the validity of a weighted application blank in predicting turnover for clerical employees. Cross-validated results showed relatively low shrinkage of the validity coefficient, and indicated that weighted application blank scores could be used as a basis of selection.

6346. Lefkowitz, Joel. (Baruch Coll, City U New York) **Job attitudes of police: Overall description and demographic correlates.** *Journal of Vocational Behavior*, 1974(Oct), Vol 5(2), 221-230.—Administered a battery of job questionnaires (e.g., Job Descriptive Index, Porter Need Satisfaction Questionnaire, the Leadership Opinion Questionnaire, and the Rokeach Dogmatism Scale) to 312 policemen in a midwestern city. Police appeared not to be dissimilar from other "typical" industrial samples in terms of job satisfaction patterns, need gratification and orientation, job involvement, dogmatism, anti-Negro bias, and supervisory orientation. They were, however, more dissatisfied with their jobs than were comparable groups. The most significant correlates of job attitudes were age, rank, and job assignment. (15 ref)—*Journal abstract.*

6347. McLaughlin, Gerald W. & Butler, Richard P. (Virginia Polytechnical Inst) **Perceived importance of various job characteristics by West Point graduates.** *Personnel Psychology*, 1973(Fal), Vol 26(3), 351-358.—Investigated the relative importance of various job characteristics to a select group of Army officers and examined whether A. Maslow's hierarchy of needs (1954) is useful for describing their need structure. A 31-item questionnaire was sent to 1,003 West Point graduates from the classes of 1963-1967. 605 (60%) were returned. It was found that the greatest importance was attached to job characteristics that pertain to one's reputation

This is interpreted to mean that these Ss were functioning primarily at a level where they were concerned with status, recognition, and respect. Self-esteem, safety/security, and self-fulfillment were important needs in that ranked order. Maslow's theory was found to be useful. It is concluded that the army should concentrate its improvement plan for officers on improving self-esteem and reputation.—R. S. Albin.

6348. Morgan, Ben B.; Brown, Bill R. & Alluisi, Earl A. (Old Dominion U) **Effects on sustained performance of 48 hours of continuous work and sleep loss.** *Human Factors*, 1974(Aug), Vol 16(4), 406-414.—The work efficiency of 10 undergraduate research assistants during a 48-hr period of continuous work and sleep loss was assessed using the synthetic-work technique. Performance during the period of stress was significantly influenced by the circadian rhythm. Decrements first occurred after approximately 18 hrs of continuous work, and performance decreased to an average of 82% of baseline during the early morning hours of the 1st night. Performance improved to about 90% of baseline during the daytime of the 2nd day but decreased to approximately 67% during that night. All measures of performance recovered to baseline levels following a 24-hr period of rest and recovery. (17 ref)—*Journal abstract*.

6349. Mowday, Richard T.; Porter, Lyman W. & Dubin, Robert. (U California, Irvine) **Unit performance, situational factors, and employee attitudes in spatially separated work units.** *Organizational Behavior & Human Performance*, 1974(Oct), Vol 12(2), 231-248.—Investigated the relationships between work unit performance and employee attitudes and situational characteristics among 411 female clerical workers in 37 branches of a bank. The relationship of 2 independent dimensions of performance to attitudes and situational characteristics was studied in a multivariate framework by multiple discriminant analysis. Employee attitudes were significantly related to a measure of branch performance reflecting job duties performed within the branch. Employees in branches rated high in performance had a higher level of attitudes toward aspects of both the branch in which they worked and the larger organization of which it was a part, while individuals in low- and medium-performing branches had lower levels of attitudes that were similar. Situational characteristics of the branch were most highly related to the manager's performance of loan functions, a large portion of which may take place outside the branch. (18 ref)—*Journal abstract*.

6350. Newman, John E. (State Farm Insurance Co, Bloomington, IL) **Predicting absenteeism and turnover: A field comparison of Fishbein's model and traditional job attitude measures.** *Journal of Applied Psychology*, 1974(Oct), Vol 59(5), 610-615.—Studied the lab-to-field generalizability of M. Fishbein's (1967) attitude-behavior model and examined the relative efficacy of the Fishbein model and traditional job attitude measures as predictors of absenteeism and turnover. Predictor data were collected from 108 nursing home employees immediately preceding the 2-mo time period of interest. Criterion data were obtained at the end of the 2-mo period. Fishbein's model received some field support, particularly with respect to predicting turnover. Traditional job attitude measures were more effective pre-

dictors of absenteeism, while Fishbein's model was a more effective predictor of turnover. It is concluded that neither approach seems superior especially in light of the amounts of criterion variance accounted for.—*Journal abstract*.

6351. Porter, Lyman W.; Steers, Richard M.; Mowday, Richard T. & Boulian, Paul V. (U California, Graduate School of Administration, Irvine) **Organizational commitment, job satisfaction, and turnover among psychiatric technicians.** *Journal of Applied Psychology*, 1974(Oct), Vol 59(5), 603-609.—Studied changes across time in measures of organizational commitment and job satisfaction as each related to subsequent turnover among 60 recently employed psychiatric technician trainees. A longitudinal study across a 10½-mo period was conducted, with attitude measures (Organizational Commitment Questionnaire and Job Descriptive Index) collected at 4 points in time. Results of a discriminant analysis indicate that significant relationships existed between certain attitudes held by employees and turnover. Relationships between attitudes and turnover were found in the last 2 time periods only, suggesting that such relationships are strongest at points in time closest to when an individual leaves the organization. Organizational commitment discriminated better between stayers and leavers than did the various components of job satisfaction. (36 ref)—*Journal abstract*.

6352. Ramsey, J. D.; Halcomb, C. G. & Mortagy, A. K. **Self-determined work/rest cycles in hot environments.** *International Journal of Production Research*, 1974(Sep), Vol 12(5), 623-631.—24 male undergraduates performed a visual vigilance task under various temperature conditions (70, 82, and 90°F). Ss were allowed to determine when they desired a rest from monitoring. Ss selecting "long" sessions had both poorer performance scores and less accurate time estimates than Ss selecting short sessions. Ss in general did a poor job of relating their own thermal discomfort, drowsiness, boredom, estimates of job performance, and preference for the task to their actual performance score and/or time on duty. No significant temperature effects were noted. (French & German summaries) (16 ref)—*Journal abstract*.

6353. Robey, Daniel. (Marquette U) **Task design, work values, and worker response: An experimental test.** *Organizational Behavior & Human Performance*, 1974(Oct), Vol 12(2), 264-273.—Used 60 undergraduates to test the hypothesis that job satisfaction and performance are affected by the interaction of task design and work values. 2 routine decision tasks were performed by Ss classified as having either intrinsic work values or extrinsic work values using F. Friedlander's 1965 questionnaire. Findings support the hypothesis that the interaction between job content and work values affects job satisfaction. Performance data partially support the hypothesis. The job enlargement thesis is thus shown not to be generally valid but rather affected by individual differences of Ss. (18 ref)—*Journal abstract*.

6354. Theologus, George C.; Wheaton, George R. & Fleishman, Edwin A. (American Inst for Research, Washington, DC) **Effects of intermittent, moderate intensity noise stress on human performance.** *Journal of Applied Psychology*, 1974(Oct), Vol 59(5), 539-547.

—Studied the effects of prolonged exposure to 2 noise stressors (random and patterned intermittent 0 and 85 db) on the performance of 60 male undergraduates on 3 tasks requiring different abilities (reaction time, rate control, and time-sharing). The sensitivity of alternate metrics of performance degradation was also evaluated within an analysis of covariance design. Ss were randomly assigned to the various treatments, and a series of  $2 \times 2 \times 4$  (Noise Intensity  $\times$  Noise Quality  $\times$  Trial Blocks) covariance analyses were carried out. The effects of random noise on performance depended on the type of task and performance measure. The reaction-time task was affected, the rate-control task was not, and the time-sharing task was affected only after continued exposure to noise. Patterned noise had insignificant effects. (20 ref)—*Journal abstract*.

6355. Wanous, John P. (New York U, Graduate School of Business Administration) **Individual differences and reactions to job characteristics.** *Journal of Applied Psychology*, 1974(Oct), Vol 59(5), 616-622.—Evaluated 3 different methods of measuring individual differences as moderators of employee reactions to job characteristics. The 3 methods are urban vs rural background, strong vs weak belief in the Protestant work ethic, and high vs low strength for "higher order" needs. Each of these 3 methods was used as a moderator of the relationships between job characteristics on the one hand, and specific job facet satisfaction, overall job satisfaction, and job behavior on the other hand. Data were obtained from 80 newly hired female telephone operators. Based on the job satisfaction results, higher order need strength was the most useful way to measure this type of individual difference, followed by the Protestant work ethic, and lastly by urban vs rural background of the worker. There were no differences among the 3 individual differences as moderators of the job characteristics and job behavior relationship. (18 ref)—*Journal abstract*.

6356. Wearing, Alexander J. & Bishop, Doyle W. (U Melbourne, Vic, Australia) **The Fiedler contingency model and the functioning of military squads.** *Academy of Management Journal*, 1974(Sep), Vol 17(3), 450-459.—Investigated the joint effects of leader esteem for least preferred coworker (leader LPC), mean LPC of members, and intergroup competition on adjustment, interpersonal relations, and task performance effectiveness. Questionnaire data was obtained from 52 US Army combat engineer training squads of approximately 13 recruits each. The variables had few independent effects but interacted to affect the adjustment and task performances of the squads.—*Journal abstract*.

6357. Weinstein, Neil D. (Rutgers State U, Cook Coll, New Brunswick) **Effect of noise on intellectual performance.** *Journal of Applied Psychology*, 1974(Oct), Vol 59(5), 548-554.—Studied the effect of realistic noise levels on an intellectually challenging task. 33 undergraduates performed proofreading in quiet or with a background of intermittent teletype noise (70 db). As predicted, noise Ss did not differ significantly from quiet Ss in detecting spelling errors but were poorer at identifying grammatical errors. Contrary to expectations, recall of the content of the proofreading passages was unaffected. Detailed analysis revealed that Ss initially worked more slowly

and less steadily during noise bursts than during intervening quiet periods, but more accurately. Results are interpreted in terms of the feedback available to the Ss and the strategies they adopted to cope with the distraction. (15 ref)—*Journal abstract*.

6358. Wyon, D. P. (National Swedish Inst for Building Research Environmental Lab, LTH, Lund) **The effects of moderate heat stress on typewriting performance.** *Ergonomics*, 1974(May), Vol 17(3), 309-318.—Reanalyzes data from the 1923 report of the New York State Commission on Ventilation in which the typing performance of a total of 32 male and 15 female typists was evaluated for 5-10 days at air temperatures of 20 and 24°C. By using nonparametric statistical methods that were not available at the time of original publication, it is shown that Ss performed considerably and significantly more work at 20 than at 24°C on the task. (German summary) (17 ref)

### Management & Leadership

6359. Burgoyne, John G. **An action research experiment in the evaluation of a management development course.** *Journal of Management Studies*, 1973(Feb), Vol 10(1), 8-14.—The Manchester Business School's Management Course was used as the context to explore the nested action research method. Action research is characterized by (a) the observation of the behavioral context under study and the use of the observations to influence that context (influencing procedure) and (b) the assessment of the change brought about by using this method (monitoring procedure). Since these 2 quasi-independent studies are carried out "one inside the other," the approach is designated "nested." The paradigm was used to test the hypothesis that the influencing procedure, a systematic interview of course objectives and feedback on student response to the course, would result in the monitoring of an increase in student perception of how much they had learned. The confirmation of this hypothesis suggests that the paradigm is useful in the development of educational curricula.—R. A. Levitt.

6360. Cummings, L. L.; Huber, George P. & Arendt, Eugene. (U Wisconsin, Graduate School of Business, Madison) **Effects of size and spatial arrangements on group decision making.** *Academy of Management Journal*, 1974(Sep), Vol 17(3), 460-475.—Reviews the literature on the effects of group size and space upon group decision-making performance, member satisfaction, member consensus, and leadership emergence. Administrative implications are drawn from an experiment studying the effects of the 2 variables on decision quality, decision speed, and member consensus. (31 ref)

6361. Evans, Martin G. (U Toronto, School of Business, Ontario, Canada) **A leader's ability to differentiate, the subordinate's perception of the leader, and the subordinate's performance.** *Personnel Psychology*, 1973(Fal), Vol 26(3), 385-395.—Explored the possibility that a leader behaves differently toward different subordinates. 310 public utility workers were evaluated on job performance, leadership behavior, and ideal leader behavior based on self-ratings and completion of the Leadership Behavior Description Questionnaire. 2 hypotheses were tested: (a) that supervisors with low

stereotype scores were highly discriminating in judgments about their subordinates, and (b) that a supervisor's differentiation moderates the relationship between a subordinate's perception of the leader's behavior and the subordinate's rating of his own performance. Results failed to support either hypothesis.—R. S. Albin.

6362. Fodor, Eugene M. (Clarkson Coll of Technology) **Disparagement by a subordinate as an influence on the use of power.** *Journal of Applied Psychology*, 1974(Oct), Vol 59(5), 652-655.—Determined whether distribution of rewards by student supervisors in an industrial simulation was influenced by a situation in which a member of the work crew repeatedly disparaged their competence. Ss were 60 male undergraduates. Disparagement did not appear to affect the supervisor's allocation of rewards to an ingratiation, but it did result in a tendency to favor a compliant worker who was not an ingratiation. Under circumstances where he found himself the object of denigration by a subordinate, the supervisor gave the compliant worker higher creativity ratings on toy models designed during the simulation than he did in the control condition of the experiment.—*Journal abstract*.

6363. Goodman, Paul S. (Carnegie-Mellon U) **An examination of referents used in the evaluation of pay.** *Organizational Behavior & Human Performance*, 1974(Oct), Vol 12(2), 170-195.—Presents a conceptual framework for determining how people evaluate their pay. Data from 209 25-65 yr old managers indicate that people use multiple referents in evaluating their pay. 3 classes of referents (other, system, and self) were identified which were significantly associated with feelings about pay satisfaction. Factors affecting the selection of referents were also described. Level of professionalism and salary were related to the selection of different types of referents. Location in an organizational boundary (vs inside) role did not directly affect the selection of referents. (17 ref)—*Journal abstract*.

6364. Hammer, W. Clay & Tosi, Henry L. (Michigan State U) **Relationship of role conflict and role ambiguity to job involvement measures.** *Journal of Applied Psychology*, 1974(Aug), Vol 59(4), 497-499.—Obtained measures of role conflict, role ambiguity, and various job involvement variables for 61 high-level managers. Role conflict was negatively related to the amount of reported influence and positively related to the amount of perceived threat and anxiety. Role ambiguity was negatively correlated with job satisfaction and influence, and positively related to job threat and anxiety. It is suggested that organizational level be taken into account when studying the relationship of role stress factors with job involvement measures.—*Journal abstract*.

6365. Heneman, Herbert G. (U Wisconsin, Graduate School of Business, Madison) **Comparisons of self- and superior ratings of managerial performance.** *Journal of Applied Psychology*, 1974(Oct), Vol 59(5), 638-642.—Self- and superior ratings of performance on 9 dimensions were obtained from an interorganizational sample of 102 managers by a mail questionnaire. It was found that self-ratings possessed less leniency, restriction of range, and halo error than did superior ratings. The ratings only partially met the requirements of convergent and discriminant validity. (15 ref)—*Journal abstract*.

6366. Ivancevich, John M. (U Houston) **A study of a cognitive training program: Trainer styles and group development.** *Academy of Management Journal*, 1974(Sep), Vol 17(3), 428-439.—Studied 2 groups of 1st-level managers ( $n = 32$ ) involved in a cognitive-oriented training program. The structured or directive style was more effective in achieving group cohesiveness, minimizing participant conflict, increasing communication, achieving group productivity, and encouraging a favorable attitude toward the trainer than was a less structured trainer style.—*Journal abstract*.

6367. Larcebeau, Jean. [Man in the work hierarchy.] (Fren) *Orientation Scolaire et Professionnelle*, 1974(Jan-Mar), No 1, 23-42.—Describes the relationship between superior and subordinate as a material exchange of a certain amount of time during which service is rendered. The function of hierarchical chains is seen as collecting time on each level from the worker and disseminating the time of the superior (in the form of his competence and judgment) toward the bottom of the hierarchy. Protection and remuneration of the subordinate corresponds to his loyalty and respect toward the superior.

6368. Mackenzie, Kenneth D. (U Kansas) **Measuring a person's capacity for interaction in a problem solving group.** *Organizational Behavior & Human Performance*, 1974(Oct), Vol 12(2), 149-169.—Describes a study in which the problem of combining the determinants of the span of control of a supervisor in a hierarchy was extended to that of deriving an expression for the maximum number of subordinates a person can have. This maximum is constrained by the norm set by the group and considers slack time, internal calculation time, and times for interaction with supervisors and colleagues as well as subordinates. The expression for maximum span of control was then modified for use with empirical data from actual groups. A discussion of some of the data problems and their solutions is presented. Among these problems are learning, varying problem complexity, and clock errors.—*Journal abstract*.

6369. Miner, John B. (Georgia State U) **Motivation to manage among women: Studies of business managers and educational administrators.** *Journal of Vocational Behavior*, 1974(Oct), Vol 5(2), 197-208.—Conducted studies in a department store and in 4 school districts to determine if managerial motivation is related to management success indexes and whether female managers have less managerial motivation than males. Ss were 44 female and 26 male managers in the department store (mean ages = 47.9 and 34.8 yrs, respectively) and 25 female and 194 male educational administrators (mean age = 53.5 and 45.0 yrs, respectively). The measure of managerial motivation used was the Miner Sentence Completion Scale. Managerial motivation was significantly related to the success of female managers, but no consistent differences in the managerial motivation of male and female managers were found. Implications for the vocational guidance of females and for research in the area of managerial talent supplies are discussed.—*Journal abstract*.

6370. Miner, John B. (Georgia State U) **Motivation to manage among women: Studies of college students.** *Journal of Vocational Behavior*, 1974(Oct), Vol 5(2),

241-250.—Administered the Miner Sentence Completion Scale (MSCS) to 46 male and 97 female undergraduate education students, 99 male and 42 female graduate education students, 107 female and 944 male undergraduate business students, and 29 male and 47 female liberal arts undergraduates. Although differences in the motivation to manage were not found among Ss majoring in education, females in business administration and liberal arts had lower managerial motivation scores than the comparable male samples. Findings are discussed in terms of their relationships to sex discrimination, prospective managerial talent shortages, and the vocational guidance of female undergraduates in general.—*Journal abstract.*

6371. Rosen, Sidney; Grandison, Richard J. & Stewart, John E. (U Georgia) **Discriminatory buckpassing: Delegating transmission of bad news.** *Organizational Behavior & Human Performance*, 1974(Oct), Vol 12(2), 249-263.—48 male undergraduates were assigned the role of personnel manager while a confederate served as their assistant. Their task was to test a job applicant (confederate) and, based on his (rigged) passing or failing performance, to inform him of whether he would be hired for a (bogus) position. Managers also had to decide whether to tell the good or bad news directly to the applicant or to delegate ("buck-pass") the telling to their assistant. After the 1st candidate left, a 2nd arrived unexpectedly. It was predicted that managers would initially adopt the preferred role of discriminatory buckpassing (telling good news directly, buck-passing on bad news), but would see the 2nd candidate's arrival as an opportunity to achieve equity with their assistant. There was no evidence of equitable behavior. Instead, discriminatory buck-passing occurred to a nonsignificant extent on the 1st candidate and to a significant extent on the 2nd. (27 ref)—*Journal abstract.*

6372. Schneler, Craig E. (U Colorado) **Behavior modification in management: A review and critique.** *Academy of Management Journal*, 1974(Sep), Vol 17(3), 528-548.—Reviews the management literature concerning the use of operant principles and of behavior modification techniques. Included are studies explaining organizational research testing operant principles and work done to date regarding applications of behavior modification in organizations. (117 ref)

6373. South, John C. (Duquesne U) **Achievement motivation among managers of small businesses, corporation managers, and business students.** *Journal of Applied Psychology*, 1974(Aug), Vol 59(4), 509-510.—A questionnaire measure of achievement motivation by H. J. Hermans that was originally tested on college students in the Netherlands was administered to 45 business college students, 41 small business managers, and 36 corporation managers. In addition, category scores were developed to reflect the more specific components of the need for achievement (n-Ach) construct. Item analyses and Kuder-Richardson 20 estimates were adequate. Intercorrelations among the category scores were significantly lower for the student sample, which suggests the n-Ach construct may be less differentiated among older managers. Managers differed significantly from business students on several components of n-Ach.—*Journal abstract.*

6374. Taylor, Ronald N. & Dunnette, Marvin D. (U British Columbia, Vancouver, Canada) **Relative contribution of decision-maker attributes to decision processes.** *Organizational Behavior & Human Performance*, 1974(Oct), Vol 12(2), 286-298.—Studied individual and joint contributions to decision processes of psychological and demographic attributes of decision-makers in 79 male industrial managers. Performance in decision-making was determined by the Personnel Decision Simulation, a simulated managerial decision problem which measures 8 decision processes. The cognitive attributes contributed heavily to the evaluative aspects of decision-making (i.e., judging information diagnosticity and integrating it into a high quality solution) particularly to predecision and decision point behavior. Motivational and personality attributes (measured by a battery of 14 tests) influenced stylistic or idiosyncratic behaviors leading to a choice (e.g., amount of information sought and processing rate) and was especially influential on post-decisional behaviors (e.g., decision confidence and decision flexibility). (20 ref)—*Journal abstract.*

6375. Taylor, Ronald N. & Dunnette, Marvin D. (U British Columbia, Vancouver, Canada) **Influence of dogmatism, risk-taking propensity, and intelligence on decision-making strategies for a sample of industrial managers.** *Journal of Applied Psychology*, 1974(Aug), Vol 59(4), 420-423.—Used the Rokeach Dogmatism Scale, Choice Dilemmas Questionnaire, and Personnel Classification Test to assess the relative influence of dogmatism, risk-taking propensity, and intelligence on strategies adopted in a decision-making exercise for 79 male industrial managers. Results support previous findings that dogmatism is associated with a decision-making strategy characterized by rapid and confidently held decisions following limited information search. High propensity for risk was associated with an information-seeking strategy involving rapid decisions made on the basis of little information, but involved deliberate information processing. Intelligence was positively correlated with efficiency in processing information, accurate choices, and cautiousness in changing decisions in the face of adverse consequences.—*Journal abstract.*

6376. Templer, Andrew J. (Standard Telephones & Cables, Boksburg, South Africa) **Self-perceived and others-perceived leadership style using the Leader Behavior Description Questionnaire.** *Personnel Psychology*, 1973(Fal), Vol 26(3), 359-367.—Studied the relationship between self-perceived and others-perceived management style, and briefly examined some of the personality correlates of leadership style. The Leader Behavior Description Questionnaire (LBDQ) and 3 other measures were administered to 60 male middle-managers from a large South African firm. Results are interpreted as casting doubt on the validity of the LBDQ as a measure of leadership style. The LBDQ did not measure independent dimensions of leader behavior, and self-rating and supervisor ratings differed. Implications for the assessment of managers are discussed and suggestions for alternative approaches to management evaluation are presented. (16 ref)—*R. S. Albin.*

6377. Tosi, Henry L. (Michigan State U) **The effect of the interaction of leader behavior and subordinate authoritarianism.** *Personnel Psychology*, 1973(Fal), Vol

26(3), 339-350.—Evaluated an aspect of leader behavior and a personality trait of a subordinate, i.e., authoritarianism, and how it relates to the attitudes and performance of the subordinate. The interaction between the level of authoritarianism and tolerance for freedom on the part of the leader were examined. Questionnaire data from 488 managers of retail finance offices in a large consumer finance firm were evaluated for authoritarianism, job satisfaction, job threat and anxiety, role ambiguity, tolerance for freedom, and productivity. It was found that leader tolerance for freedom and subordinate authoritarianism were not related to performance measures.—*R. S. Albin.*

### Organizational Structure & Climate

6378. Chattopadhyay, Gouranga P. The use of a group dynamics laboratory in process consultation: A case study set in the Bank of Calcutta: II. *Journal of Management Studies*, 1973(Feb), Vol 10(1), 15-24.

6379. Johnston, H. Russell. (Wake Forest U, Babcock Graduate School of Management) Some personality correlates of the relationships between individuals and organizations. *Journal of Applied Psychology*, 1974(Oct), Vol 59(5), 623-632.—Used data from the Thematic Apperception Test and nondirective interviews with 39 professionals employed by a consulting firm to study the link between 3 personality dimensions and the individual's perceptions of his relationship with the organization. Results show that individuals with active or high-task orientation perceive a more positive relationship with the organization generally and with specific features of the organization than do passive or low-task peers. Differences along the interpersonal dimension were not significant. Results raise questions concerning more effective matching of individuals and organizations.—*Journal abstract.*

6380. Khaliq, Nazre. (U Karachi, Pakistan) Bureaucratic orientation: A cross-cultural study. *Psychologia: An International Journal of Psychology in the Orient*, 1974(Jun), Vol 17(2), 71-74.—Compared 174 Pakistani education students of both sexes with their American and Japanese counterparts. Scores were tested for normality and homogeneity of variance, and the resulting data were tabulated. No significant sex differences appeared among the 3 cultures as to preferences for bureaucratic values. Pakistani female students were more bureaucratically oriented than their American counterparts.—*R. D. Nance.*

6381. Teiger, C.; Laville, A. & Duraffourg, J. (CNRS, Paris, France) [The nature of skilled work: A study in the electronics industry.] (Fren) *Orientation Scolaire et Professionnelle*, 1974(Jan-Mar), No 1, 7-21.—Investigated the requirements of work on an assembly line for TV sets in a French factory and their effects on the female operators. It was found that piece work is highly variable and physically demanding, entailing considerable mental activity, particularly in information processing and decision making under severe time constraints. Physiological, social, and psychological behavior syndromes seem to be related to the work situation.—*M. G. Strobel.*

### Human Factors Engineering & Safety

6382. Allen, John A.; Schroeder, Stephen R. & Ball, Patricia G. (U North Carolina, Highway Safety Research Ctr, Chapel Hill) Effects of head restriction on drivers' eye movements and errors in simulated dangerous situations. *Journal of Applied Psychology*, 1974(Oct), Vol 59(5), 643-648.—2 groups of 15 undergraduates each tracked a segment of a life insurance company driver-training film by manipulating the controls of a Drive-Trainer station. One group had their heads restricted during the session, the other did not. Restriction of the head resulted in more driving errors and fewer (a) long eye movements; (b) driving adjustments to critical events to the left of the driver's field of view; and (c) fixation errors, especially overshoots. Eye-movement frequency was positively correlated with driving adjustments and negatively related to driving errors. It is concluded that (a) driving performance is better when the eye-head compensatory system is able to move freely, (b) head restriction may bias the distribution of fixation locations, and (c) the frequency of shifting fixations may be negatively correlated with driving errors.—*Journal abstract.*

6383. Ashley, C. & Rao, B. K. An equal sensation study of differential vibration between feet and seat. *Ergonomics*, 1974(May), Vol 17(3), 331-342.—Conducted 4 experiments with a total of 20 healthy male adults in which (a) measurements of random foot and body vibration yielded contours for sinusoidal foot and body vibrations and (b) the 2 contours were compared on an equal-sensation basis. Results substantiate the equal-sensation technique and could find application in the field of vehicle ride research. (German summary)

6384. Biberman, Lucien M. (Inst for Defense Analysis, Arlington, VA) Fallacy and fact of sampled imagery displays. *Human Factors*, 1974(Jun), Vol 16(3), 286-299.—Demonstrates that factors long considered to be of primary importance to the visual performance of observers of displays of sampled imagery are dependent upon, subordinate to, or no more important than other factors largely overlooked. In TV displays, sharp raster lines interfere with the true image to form false images, and "shades of gray" and "resolution," often treated as independent variables, depend directly upon the signal-to-noise ratio in the imagery as a function of spatial frequency. Experimental and theoretical work in the area is briefly reviewed, and some implications for system design criteria are pointed out.—*Journal abstract.*

6385. Cheney, R. L. & Spencer, J. (U Wales, Inst of Science & Technology, Cardiff) Dimensional information on engineering drawings. *Ergonomics*, 1974(May), Vol 17(3), 343-363.—Examined how the lay-out of dimension values on engineering drawings affects the ability of people reading them to extract specified values accurately and rapidly. Results of 2 experiments show that the degree to which performance was subject to random influences was almost wholly dependent on the precise form of question posed about a drawing feature. Evidence indicates that a hybrid abstracted form of dimension lay-out shows promise. (German summary)

6386. Phanér, Gunilla & Hane, Monica. (U Uppsala, Sweden) Seat belts: Relations between beliefs, attitude, and use. *Journal of Applied Psychology*, 1974(Aug), Vol

59(4), 472-482.—A sample of 368 car owners answered a mailed questionnaire constructed on the basis of a model of attitudes toward seat-belt use. A factor analysis yielded a belief pattern interpreted in terms of 5 factors—Discomfort, Worry, Risk, Effect, and Inconvenience. The model appeared useful since an independent measure of attitude to seat-belt use could be predicted ( $r = .84$ ) from a linear combination of these factor scores. The correlation between the attitude measure and reported use of seat belts was .56, or about the same as that between the belief factor combination and reported use. The combination of the Discomfort and Effect factors gave near optimal predictions ( $r = .52$ ). Results were replicated on a new sample of 105 drivers. A model of seat-belt use is suggested in which conceptions about discomfort of belt usage and effects of belts in an accident are regarded as determinants of usage. (16 ref) —*Journal abstract.*

6387. Finley, Brian H.; Webster, Robert G. & Swain, Alan D. (Sandia Lab, Albuquerque, NM) **Reduction of human errors in field test programs.** *Human Factors*, 1974(Jun), Vol 16(3), 215-222.—Gathered data on errors and error-likely situations in field tests from 3 sources: test documents, interviews with test personnel (22 engineers and supervisors), and observations of a human factors specialist who participated in several field tests. Data are summarized and recommendations made on how the likelihood of such errors can be reduced by using human factors observers with duties as described in this report.—*Journal abstract.*

6388. Gould, John D. & Drongowski, Paul. (IBM Research Ctr, Yorktown Heights, NY) **An exploratory study of computer program debugging.** *Human Factors*, 1974(Jun), Vol 16(3), 258-277.—30 experienced FORTRAN programmers debugged 12 1-page FORTRAN listings, each of which was syntactically correct but contained 1 nonsyntactic error. 3 classes of bugs in each of 4 different programs were debugged. Key results show that debug times were short. The "information aids" groups did not debug faster than the control group; programmers adopted their debugging strategies based upon the information available to them. Results suggest that programmers often identify the intended state of a program before they find the bug. Debugging was at least twice as efficient the 2nd time programmers debugged a program (though with a different bug in it). A simple hierarchical description of debugging is suggested, and possible principles of debugging are identified. (30 ref)—*Journal abstract.*

6389. Gustafson, David H.; Huber, George P. & Delbecq, Andre L. (U Wisconsin, Madison) **Field testing medical decision-aiding systems.** *Human Factors*, 1974(Jun), Vol 16(3), 229-237.—Made 2 studies concerned with the valuation of computer-supplemented medical decision-aiding systems to derive and illustrate guidelines for designing, conducting, and analyzing field tests of medical systems. The guidelines presented are not exhaustive and are intended to supplement those commonly found in books dealing with research evaluation.

6390. Harrigan, John E. (California Polytechnic State U, San Luis Obispo) **Human factors information taxonomy: Fundamental human factors applications for**

**architectural programs.** *Human Factors*, 1974(Aug), Vol 16(4), 432-440.—Identification of user expectations and requirements, which is vital to the successful implementation of architectural programs, can be achieved through the application of behavioral science and human factors techniques to the professional practice of architecture. A 27-item taxonomy of informational objectives is presented which stresses analytic techniques based on direct observation of user behavior. A review by the individual designer will determine which items are important for his specific architectural program. (16 ref) —*Journal abstract.*

6391. Hirsch, Joseph. (US Naval Undersea Research & Development Ctr, Pasadena, CA) **Rate control in man-machine systems.** In *Conference on cutaneous communication systems and devices*. Austin, TX: Psychonomic Society, 1974. vi, 122 p.—Describes the operation of tactile control systems and suggests that tactile signals can be used to present rate information in man-machine control systems as an alternative to quickening a visual display. Suitable systems for unmanned vehicles are outlined, and experiments on compensatory control and the effects of tactual rate signals are reported. Issues in machine tool design are also noted. (15 ref)

6392. Howarth, C. I.; Routledge, D. A. & Repetto-Wright, R. (U Nottingham, England) **An analysis of road accidents involving child pedestrians.** *Ergonomics*, 1974(May), Vol 17(3), 319-330.—Obtained measures of exposure from interviews with 168 male and 168 female 5-11 yr old children and from traffic density counts on the roads they crossed in the previous 24 hrs. Results show that the raw accident figures greatly underestimate the relative risk to children aged 5, 6, and 7 yrs, that the greater number of accidents to males of this age is not due to their greater exposure to traffic, and that by the age of 8 yrs, males are no more at risk than females. (German summary)

6393. Ince, Fuat & Williges, Robert C. (U Illinois) **Detecting slow changes in system dynamics.** *Human Factors*, 1974(Jun), Vol 16(3), 278-285.—Performed 2 experiments, each with 4 male undergraduate volunteers, to study the human operator's adaptive behavior in manual control of slowly changing system dynamics. In Exp I the dynamics changed from rate to acceleration control. In Exp II the control-stick sensitivity slowly increased or decreased from a standard level. Tracking performance on a compensatory task demonstrated that the human operator lags in adapting to the changing system dynamics, but he does adapt when given sufficient time. As the rate of change increases, the human operator needs a larger change for detection of the change and less time to detect the changing system dynamics.—*Journal abstract.*

6394. Johnson, Edgar M. & Baker, James D. (US Army Research Inst for the Behavioral & Social Sciences, Arlington, VA) **Field testing: The delicate compromise.** *Human Factors*, 1974(Jun), Vol 16(3), 203-214.—Selectively compares human factors field testing with laboratory experimentation. Although each is derived from the scientific method, it is demonstrated that there are critical differences between the 2 research settings. Field testing is not a simple extension of the laboratory into an operational setting. Techniques,

procedures, and research strategies differ; a technology is evolving to bridge the gap between the 2 research domains. (21 ref)—*Journal abstract*.

6395. Kassab, Samuel J. (Erie Community Coll, North Campus, Williamsville) **Research note: Reduction of muscular fatigue associated with repetitive light assembly operations by means of arm counterbalancing.** *Human Factors*, 1974(Jun), Vol 16(3), 323-326.—The muscular effort required to perform a light assembly task was monitored by electromyography on each of 14 female Ss first with the arms unsupported and then with the weight of the arms counterbalanced. A highly significant difference was found, indicating that muscular effort can be reduced approximately 50% by counterbalancing the weight of the arms.

6396. Luria, S. M. et al. (US Naval Submarine Base New London, Naval Submarine Medical Research Lab, Groton, CT) **Vision through various scuba facemasks.** *Human Factors*, 1974(Aug), Vol 16(4), 395-405.—Comparisons of 5 commercially available facemasks, using 150 Ss, showed significant differences among the masks for every visual process tested. Some masks were superior for one purpose and inferior for another (e.g., the mask which had lenses designed to compensate for the optical distortions found under water, improved size and distance estimates and hand-eye coordination but degraded acuity and stereoacuity). Results are not explained on the basis of differential susceptibility to fogging. (20 ref)

6397. Roscoe, Stanley N. (U Illinois) **Assessment of pilotage error in airborne area navigation procedures.** *Human Factors*, 1974(Jun), Vol 16(3), 223-228.—To establish the accuracy of use and freedom from pilot blunders associated with systems employing various configurations of displays and controls it is stressed that both simulator and flight experimentation are necessary. An automatically adaptive cockpit side task provides a saturating level of pilot workload and allows sensitive and statistically reliable measurement of a pilot's residual attention as a common metric for area navigation system assessment. (16 ref)

6398. Siegel, Arthur I.; Federman, Philip J. & Burkett, James R. (Applied Psychological Services, Wayne, PA) **Increasing and evaluating the readability of Air Force written materials.** *US AFHRL Technical Report*,

1974(Aug), No 74-28, 88 p.—Describes how to apply techniques—including the cloze and Flesch methods, SMOG grade, FORCAST, and the Automated Readability Index—that have been used in measuring the readability-comprehensibility and reading level of textual materials. Instructions are provided, in a step-by-step fashion, for determining the reading level of written material and for presenting subject matter material through methods other than prose. Procedures for simplifying written material are presented, and experimental methods for determining the effectiveness of written material are described. Multisensory presentation of US Air Force training material is examined. (35 ref)—*Journal abstract*.

6399. Snyder, Harry L. (Virginia Polytechnic Inst & State U) **Image quality and face recognition on a television display.** *Human Factors*, 1974(Jun), Vol 16(3), 300-307.—5 observers were asked to match faces presented singly on a TV display with 1 of 35 faces presented on a photographic display. The probability of correct recognition and the time required to recognize the single face were related to the quality of the TV image. Image quality was varied by changing the square-wave response of the TV system and the video signal-to-noise voltage ratio. A derived unitary metric of image quality, the square-wave modulation transfer function area, correlated highly with both measures of observer performance. The utility of this metric for systems design is discussed.—*Journal abstract*.

6400. Triggs, Thomas J.; Levison, William H. & Sanneman, Richard. (Bolt Beranek & Newman, Cambridge, MA) **Some experience with flight-related electrocutaneous and vibrotactile displays.** In *Conference on cutaneous communication systems and devices*. Austin, TX: Psychonomic Society, 1974. vi, 122 p.—Reports a series of experiments which evaluated various design parameters of quantized tactual displays for the presentation of information important in flight control. Findings from studies of tactual vs visual tracking, tactile display location, types of cutaneous stimulation, and step-input tracking are presented. Tactual displays produced significantly worse performances than standard visual displays and therefore may be more suitable for fewer wide-band inputs. (30 ref)

## BRIEF SUBJECT INDEX

Entries in the Brief Subject Index are derived from a 4,000-term *Thesaurus of Psychological Terms*. Only those terms representing subject matter content covered in this monthly issue are listed. A thesaurus term missing from the listing indicates that no material of major relevance to the concept is included in the issue. Records are indexed at the level of specificity contained in each document. Each index entry also refers the reader to broader generic concepts as well as to more specific concepts related to each term. Thus, a reader interested in articles concerning childhood psychosis may find additional relevant information under "psychosis" or "early infantile autism."

 Agricultural Workers 6336

# BRIEF SUBJECT INDEX

**Aircraft Pilots** 4370, 4702, 6316, 6333  
**Akinesia** [See Apraxia]  
**Alarm Responses** 4775  
**Alcohol Drinking Patterns** [See also Problem Drinking, Social Drinking] 5021, 5042, 5063, 5075, 5132, 5618, 5619, 5628, 5646, 5647, 5649, 5650, 5878  
**Alcohol Intoxication** [See also Chronic Alcoholic Intoxication] 4706, 4732, 5021  
**Alcoholic Beverages** [See also Beer] 4695, 4702  
**Alcoholic Hallucinoses** [See also Korsakoffs Psychosis] 5612  
**Alcoholic Psychosis** [See Alcoholic Hallucinoses, Korsakoffs Psychosis]  
**Alcoholism** [See also Korsakoffs Psychosis] 4732, 5466, 5504, 5600, 5605, 5606, 5611, 5612, 5618, 5620, 5621, 5628, 5629, 5634, 5642, 5646, 5649, 5650, 5843, 5865, 5893, 5908, 5938  
**Alcohols** [See also Ethanol, Isoproterenol, Tetrahydrocannabinol] 4707, 4713, 4715, 4732, 4754, 4762  
**Alexia** [See Aphasia]  
**Algebra** [See Mathematics Education]  
**Alienation** 4948, 5161, 5324, 6336  
**Alkaloids** [See Apomorphine, Atropine, Caffeine, Cocaine, Heroin, Mescaline, Morphine, Nicotine, Peyote, Physostigmine, Pilocarpine, Reserpine, Scopolamine, Tubocurarine]  
**Allergic Disorders** [See Food Allergies]  
**Alopecia** 4326  
**Alphabets** [See Initial Teaching Alphabet, Letters (Alphabet)]  
**Altitude Effects** 4594  
**Altruism** 4965, 4971, 5228, 5560  
**Ambiguity (Stimulus)** [See Stimulus Ambiguity]  
**Ambiguity (Tolerance)** [See Tolerance For Ambiguity]  
**Amenorrhea** 5467  
**Amentia** [See Mental Retardation]  
**American Indians** 5022, 5132, 5278, 5843, 6148, 6154  
**Amine Oxidase Inhibitors** [See Lysergic Acid Diethylamide]  
**Amine Oxidases** [See Monoamine Oxidase]  
**Amines** [See also Amitriptyline, Amphetamine, Atropine, Catecholamines, Chlordiazepoxide, Chlorpromazine, Cocaine, Dextroamphetamine, Dopamine, Histamine, Imipramine, Mecamylamine, Norepinephrine, Physostigmine, Scopolamine, Serotonin] 4719  
**Amino Acids** [See also Histidine, Methionine, Tryptophan] 4693  
**Amitriptyline** 5860, 5861  
**Amnesia** 4608, 4647, 4654, 4665, 4726, 4744, 5738  
**Amphetamine** 4692, 4755, 4767, 5081, 5619  
**Amphetamine (D-)** [See Dextroamphetamine]  
**Amphetamine (DL-)** [See Amphetamine]  
**Amphetamine Sulfate** [See Amphetamine]  
**Amphibia** [See also Frogs] 4542  
**Amydaloid Body** 4549, 4617, 4626, 4631, 4646  
**Anagram Problem Solving** 4415  
**Anaesthetic Drugs** [See also Aspirin, Atropine, Heroin, Methadone, Morphine, Scopolamine] 4684, 4685, 5885  
**Analysis of Covariance** 4299, 4316

**Analysis of Variance** 4309, 4313, 4316  
**Analysts** [See Psychoanalysts]  
**Analytical Psychotherapy** 5332, 5429, 5797  
**Ancestors** [See Parents]  
**Androgens** [See also Testosterone] 4621, 4652, 4764, 4831  
**Anencephaly** 5750  
**Anesthetic Drugs** [See also Cocaine, Ether (Anesthetic), Lidocaine, Pentobarbital] 4676, 4710  
**Anger** [See also Hostility] 4964  
**Angina Pectoris** 5713  
**Angiotensin** 4675  
**Angst** [See Anxiety]  
**Anguish** [See Distress]  
**Animal Aggressive Behavior** [See also Attack Behavior, Threat Postures] 4652, 4657, 4676, 4677, 4718, 4746, 4768, 4816, 4834  
**Animal Behavior** [See Animal Ethology]  
**Animal Biological Rhythms** [See also Animal Circadian Rhythms] 4831, 4836  
**Animal Breeding** 4634, 4771  
**Animal Circadian Rhythms** 4789  
**Animal Communication** 4810, 4820, 4821, 4823, 4825, 4827, 4829, 4833  
**Animal Division of Labor** 4822  
**Animal Dominance** 4573  
**Animal Drinking Behavior** 4578, 4645, 4655, 4675, 4707, 4734, 4745, 4759, 4789  
**Animal Environments** 4599, 4654, 4773, 4798, 4808, 4811, 4816, 4828  
**Animal Escape Behavior** 4643  
**Animal Ethology** [See also Animal Aggressive Behavior, Animal Biological Rhythms, Animal Circadian Rhythms, Animal Communication, Animal Division of Labor, Animal Dominance, Animal Drinking Behavior, Animal Escape Behavior, Animal Exploratory Behavior, Animal Feeding Behavior, Animal Innate Behavior, Animal Instinctive Behavior, Animal Maternal Behavior, Animal Mating Behavior, Animal Nocturnal Behavior, Animal Open Field Behavior, Animal Play, Animal Sex Differences, Animal Sexual Receptivity, Animal Social Behavior, Attack Behavior, Nest Building, Threat Postures] 4771, 4773, 4775, 4780, 4808, 4816, 4819  
**Animal Exploratory Behavior** 4650, 4662, 4711, 4778, 4804  
**Animal Feeding Behavior** 4596, 4605, 4611, 4612, 4617, 4632, 4633, 4634, 4645, 4651, 4655, 4745, 4779, 4830, 4835, 4837  
**Animal Innate Behavior** 4779  
**Animal Instinctive Behavior** 4818  
**Animal Maternal Behavior** 4589, 4653, 4746, 4774, 4779, 4781, 4807, 4812, 4817, 4818, 4819, 4826, 4828  
**Animal Mating Behavior** [See also Animal Sexual Receptivity] 4764, 4806, 4811, 4814, 4831  
**Animal Motivation** 4634, 4651, 4655, 4666, 4671, 4677, 4711, 4750, 4783, 4786, 4798  
**Animal Nocturnal Behavior** 4836  
**Animal Open Field Behavior** 4708, 4727, 4756, 4836  
**Animal Play** 4828  
**Animal Sex Differences** 4630, 4644, 4804  
**Animal Sexual Receptivity** 4616, 4621, 4764, 4809, 4831, 4832  
**Animal Social Behavior** [See also Animal Aggressive Behavior, Animal Communi-

cation, Animal Division of Labor, Animal Dominance, Animal Maternal Behavior, Animal Mating Behavior, Animal Sexual Receptivity, Attack Behavior, Threat Postures] 4649, 4774, 4807, 4808, 4811, 4813, 4814, 4815, 4817, 4825, 4828, 4829, 4832  
**Animal Strain Differences** [See Animal Breeding, Genetics]  
**Animals** [See Also Related Terms] 5530  
**Anodynes** [See Analgesic Drugs]  
**Anomie** [See Alienation]  
**Anorexia Nervosa** 5462, 5467, 5501, 5813  
**Anoxia** 4608  
**Antagonism** [See Hostility]

# BRIEF SUBJECT INDEX

Continuous Reinforcement [See Reinforcement Schedules]  
 Contour [See Form And Shape Perception]  
 Contraception [See Birth Control]  
 Contraceptive Devices [See Oral Contraceptives]  
 Contraceptive Methods [See Birth Control]  
 Contribution (Professional) [See Professional Contribution]  
 Control (Locus of) [See Internal External Locus of Control]  
 Control (Stimulus) [See Stimulus Control]  
 Convergent Thinking [See Inductive Deductive Reasoning]  
 Conversion Neurosis [See Hysterical Vision Disturbances]  
 Convulsions 4603, 4604, 4623, 4724, 5708, 5712, 5778  
 Cooperation 4987, 4988, 5153, 5159, 5160, 5166, 5167, 5170, 5216, 5226, 5373  
 Coordination (Perceptual Motor) [See Perceptual Motor Coordination]  
 Coping Behavior 5300, 5346, 6052, 6317  
 Copulation [See Sexual Intercourse (Human)]  
 Copulation (Animal) [See Animal Mating Behavior]  
 Cornea 4593  
 Corpora Quadrigemina [See Optic Lobe, Superior Colliculus]  
 Correctional Institutions [See also Prisons] 5401, 5430, 6033, 6035, 6041, 6065, 6076  
 Correlation (Statistical) [See Statistical Correlation]  
 Cortex (Auditory) [See Auditory Cortex]  
 Cortex (Cerebral) [See Cerebral Cortex]  
 Cortex (Motor) [See Motor Cortex]  
 Cortex (Visual) [See Visual Cortex]  
 Cortical Evoked Potentials 4555, 4562, 4688, 4696, 5311  
 Corticosteroids [See Corticosterone]  
 Corticosterone 4619, 4644  
 Corticotropin 4726, 4744, 4751, 5778  
 Costs And Cost Analysis 5406, 5420, 5894, 5921, 5990, 6089, 6242, 6269  
 Counselees [See Clients]  
 Counseling (Group) [See Group Counseling]  
 Counseling [See Also Related Terms] 5077, 5372, 5408, 5980, 5983, 5998, 6007, 6010, 6231, 6324  
 Counselor Characteristics 5380, 5381, 5396, 5397, 5785, 6010, 6255  
 Counselor Client Interaction [See Psychotherapeutic Processes]  
 Counselor Education 5383, 5396, 5397, 5408, 5426  
 Counselor Effectiveness [See Counselor Characteristics]  
 Counselor Personality [See Counselor Characteristics]  
 Counselor Role 5397, 5983, 6004  
 Counselor Trainees 5372, 5397, 5428, 6319  
 Counselors [See also School Counselors, Vocational Counselors] 5380, 5381, 6248  
 Countertransference 5833  
 Courts [See Adjudication]  
 Cramps (Muscle) [See Muscular Disorders]  
 Cranial Nerves [See Optic Nerve]  
 Craving [See Appetite]

Creative Writing [See Literature]  
 Creativity 5182, 6145, 6170  
 Credibility 5234, 5364  
 Crime [See also Homicide, Rape, Theft] 4310, 5074, 5085, 5191, 5599, 5616, 5889  
 Criminal Law 5079, 5100, 5553  
 Criminals [See also Female Criminals, Male Criminals] 5916, 6041  
 Criminology 5401  
 Crippled [See Physically Handicapped]  
 Crises [See also Family Crises, Identity Crisis] 4998, 5128, 5347, 5717  
 Crisis (Reactions To) [See Stress Reactions]  
 Crisis Intervention [See also Suicide Prevention] 5914, 6008  
 Crisis Intervention Services [See also Suicide Prevention Centers] 5376, 5972  
 Criticism (Professional) [See Professional Criticism]  
 Cross Cultural Differences 4284, 5021, 5026, 5027, 5035, 5036, 5038, 5042, 5049, 5087, 5136, 5150, 5204, 5326, 5339, 5648, 6111, 6315, 6380  
 Crowding [See Overpopulation]  
 Crying 4877, 4983  
 Cues 4375, 4435, 4443, 4447, 4450, 4457, 4470, 4488, 4499, 4646, 4647, 4785, 4883, 4899, 4935, 5195, 5737, 6163, 6248, 6268  
 Cultism 5483  
 Cultural Assimilation 5352  
 Cultural Familial Mental Retardation [See Psychosocial Mental Retardation]  
 Cultural Test Bias 6235, 6246, 6259, 6264, 6265, 6307  
 Culture (Anthropological) 5021, 5027, 5028  
 Culture Change 5096, 5122, 5132, 5439, 5584  
 Curiosity 4425  
 Curriculum [See also Braille Instruction, Compensatory Education, Drug Education, Foreign Language Education, Health Education, Language Arts Education, Mathematics Education, Music Education, Reading Education, Science Education, Sex Education, Spelling, Vocational Education] 5116, 5384, 6100, 6101, 6129, 6158, 6159, 6164, 6169, 6172, 6173  
 Curriculum Development 5670, 6126, 6139, 6193, 6214  
 Cutaneous Sense [See also Tactile Perception, Vibrotactile Thresholds] 4318, 4320, 4324, 4334, 4558, 5240, 5744, 6400  
 Cyclothymic Personality 5586  
 Daily Biological Rhythms (Animal) [See Animal Circadian Rhythms]  
 Dance Therapy 6210  
 Data Processing 6311  
 Day Care (Child) [See Child Day Care]  
 Daydreaming 5124  
 Deaf 5705, 5715, 5725, 5732, 5741, 5744, 5759, 6201, 6208, 6228  
 Death And Dying [See also Euthanasia] 4268, 4687, 4916, 4918, 4921, 4938, 4975, 5004, 5093, 5443, 5464, 5509, 5520, 5634, 5643, 5707, 5710, 5718, 5724, 5736, 5746, 5756, 5794, 5984, 6002, 6008, 6011, 6012, 6158  
 Death Attitudes 4918, 4938, 5004, 5010, 5024, 5058, 5093, 5707, 5711, 5724, 5736, 5756, 5794, 5824, 6158  
 Death Rate [See Mortality Rate]

Deception 4265  
 Decision Making [See also Choice Behavior, Management Decision Making] 4310, 4399, 4410, 4460, 4472, 4529, 4867, 5023, 5068, 5148, 5156, 6310, 6331, 6353  
 Deductive Reasoning [See Inductive Deductive Reasoning]  
 Defense Mechanisms [See also Displacement (Defense Mechanism), Fantasy (Defense Mechanism), Identification (Defense Mechanism), Projection (Defense Mechanism)] 5322, 5357, 5388, 5591  
 Deficiency Disorders (Nutritional) [See Nutritional Deficiencies]  
 Delayed Reinforcement [See Reinforcement Schedules]  
 Delinquency (Juvenile) [See Juvenile Delinquency]  
 Dementia (Presenile) [See Presenile Dementia]  
 Dementia Praecox [See Schizophrenia]  
 Democracy 5106, 6134  
 Democratic Party [See Political Parties]  
 Demographic Characteristics 4980, 5002, 5071, 5072, 5090, 5115, 5139, 5463, 5493, 5622, 5635, 5645, 5647, 5650, 5651, 5673, 5773, 6047, 6085, 6187, 6279, 6334, 6346  
 Demonstrations (Social) [See Social Demonstrations]  
 Denmark 5391, 5420, 6230, 6244, 6251  
 Deoxyribonucleic Acid 5504  
 Dependency (Drug) [See Drug Dependency]  
 Dependency (Personality) 5021, 5164, 5500, 5637  
 Depersonalization 5518, 5957  
 Depression (Emotion) [See also Manic Depression, Neurotic Depressive Reaction, Psychotic Depressive Reaction] 4594, 4719, 5448, 5450, 5460, 5469, 5474, 5496, 5498, 5499, 5508, 5513, 5527, 5589, 5596, 5619, 5717, 5844, 5848, 5856, 5859, 5860, 5862, 5870, 5873, 5878, 5883, 5886, 5888, 5892  
 Depression (Spreading) [See Spreading Depression]  
 Depressive Reaction (Neurotic) [See Neurotic Depressive Reaction]  
 Deprivation [See Food Deprivation, Sensory Deprivation, Sleep Deprivation, Social Deprivation, Social Isolation, Water Deprivation]  
 Depth Perception 4364, 5666  
 Desensitization (Systematic) [See Systematic Desensitization Therapy]  
 Design (Experimental) [See Experimental Design]  
 Design (Man Machine Systems) [See Man Machine Systems Design]  
 Desirability (Social) [See Social Desirability]  
 Desires [See Motivation]  
 Detection (Signal) [See Signal Detection (Perception)]  
 Detention (Legal) [See Legal Detention]  
 Detoxification 5645  
 Developmental Age Groups [See also Adolescents, Adults, Aged, Children, Infants, Middle Aged, Neonates, Preschool Age Children, School Age Children, Young Adults] 4902  
 Developmental Differences [See also Age Differences] 4262  
 Developmental Psychology [See also Adolescent Psychology, Gerontology] 5686

# BRIEF SUBJECT INDEX

- Developmental Stages [See Embryo, Fetus, Puberty]
- Deviant Behavior [See Antisocial Behavior]
- Deviations (Sexual) [See Sexual Deviations]
- Devices (Experimental) [See Apparatus]
- Devices (Safety) [See Safety Devices]
- Dexamphetamine [See Dextroamphetamine]
- Dexedrine [See Dextroamphetamine]
- Dexterity (Physical) [See Physical Dexterity]
- Dextroamphetamine 4736, 4737
- Diabetes 4694, 5847
- Diacetylmorphine [See Heroin]
- Diagnosis [See also Computer Assisted Diagnosis, Differential Diagnosis, Electro Oculography, Electroencephalography, Electromyography, Medical Diagnosis, Psychodiagnosis, Psychodiagnostic Interview] 4433, 5716
- Dialect 5246
- Dialysis [See Hemodialysis]
- Diazepam 4348, 4770, 5878
- Diencephalon [See Hypothalamus, Thalamus, Thalamus]
- Differential Diagnosis 5455, 5459, 5471, 5496, 5508, 5522, 5591, 5690, 5742
- Differential Limen [See Thresholds]
- Differential Reinforcement 4419, 4644, 4796, 5951
- Digestion 4578, 4835
- Digestive System [See Gastrointestinal System, Mouth (Anatomy), Stomach, Tongue]
- Digestive System Disorders [See Colon Disorders, Gastrointestinal Disorders, Gastrointestinal Ulcers]
- Digit Span Testing 4371
- Digits (Mathematics) [See Numbers (Numerals)]
- Dilantin [See Diphenylhydantoin]
- Diphenylhydantoin 4688, 4758, 5871
- Diphenylhydantoin Sodium [See Diphenylhydantoin]
- Disadvantaged 4914, 4973, 5745, 5765, 6179, 6180, 6184, 6193, 6212, 6323, 6329
- Disasters [See also Natural Disasters] 5509, 5971
- Discipline (Classroom) [See Classroom Discipline]
- Discrimination (Cognitive) [See Cognitive Discrimination]
- Discrimination [See Also Related Terms] 4435, 4470
- Discussion (Group) [See Group Discussion]
- Diseases [See Disorders]
- Diseases (Venereal) [See Venereal Diseases]
- Dislike [See Aversion]
- Disorders [See Also Related Terms] 5432, 5434, 5437, 5445, 5686, 5717, 5730, 5743, 5745, 5749, 6019, 6048
- Displacement (Defense Mechanism) 5817
- Displays [See Auditory Displays, Tactile Displays, Visual Displays]
- Disposition [See Personality]
- Disruptive Behavior [See Behavior Problems]
- Dissociative Patterns [See Amnesia, Multiple Personality]
- Dissonance (Cognitive) [See Cognitive Dissonance]
- Distance Discrimination [See Distance Perception]
- Distance Perception 4868
- Distortion (Perceptual) [See Illusions (Perception)]
- Distractibility 4263, 4472, 4905, 5903
- Distress 5453
- Distributed Practice 4463
- Distribution (Frequency) [See Frequency Distribution]
- Disturbed (Emotionally) [See Emotionally Disturbed]
- Diuretics [See Acetazolamide, Caffeine]
- Diurnal Variations [See Human Biological Rhythms]
- Divergent Thinking 5035
- Divided Attention 4505
- Division of Labor (Animal) [See Animal Division of Labor]
- Divorce 4963, 4995, 5975
- DNA (Deoxyribonucleic Acid) [See Deoxyribonucleic Acid]
- Doctors [See Physicians]
- Dogmatism [See Authoritarianism]
- Dogs 4592, 4596, 4669, 4717
- Doll Play 4960, 5298
